MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2085.—VOLUME LXXXI. Number 1. SAN FRANCISCO, SATURDAY, JULY 7, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Dynamites and Their Manufacture.

In the issues of June 23 and 30 appeared technical account of the manufacture of nitro-glycerine and dynamites. Continuing this subject of explosive compounds comes mention of gelignite, which consists of 65% gelatine and 35% absorbing powder, referred to in the issue of June 30. These three explosives—blasting gelatine, gelatine dynamite and gelignite—are closely related. They all consist of the variety of nitro-cellulose known as collodion-cotton dissolved in nitro-glycerine, where necessary made up with varying proportions of wood pulp, some nitrate or other material of corresponding character.

A later explosive of the combined gun cotton and nitro-glycerine series is cordite. Its proportions are 58% nitro-glycerine, 37% gun cotton, 5% vaseline. In its manufacture the gun cotton is deprived of moisture to 1%; to 28 pounds of gun cotton are added 43 pounds nitro-glycerine. These two ingredients are hand-mixed, then put through an incorporating machine with 16 pounds acetone. When these ingredients have been worked into the form of dough 4 pounds of vaseline are added; the incorporation is continued for seven hours, when the plastic mass is placed in a special press and forced through a hole, issuing from the press in the form of a thread or, in larger sizes, of a cord. The extruded cordite is wound on a drum as it issues from the press and is then taken to a drying house, where it is subjected to a temperature of 100° F. from three to nine days. By this means the solvent is evaporated and the manufacture of the cordite completed. Another class is those derived from the nitrated hydro-carbons, benzine, toluene, naphthalene and phenol. Nitro-benzine enters into the composition of several, including tonite No. 3, roburite, securite and bellite. Tonite consists of finely divided and macerated gun cotton incorporated with finely ground nitrate of barium, recrystallized. It is made by treating carbonate of barium with nitric acid. A given weight of wet, purified gun cotton, after being finely pulped, is intimately mixed under edge runners with the same weight of nitrate until the ingredients have become thoroughly incorporated and formed into a paste, then pressed into cartridges having a recess at one end for the insertion of the detonator, the cartridges being finally wrapped in paraffined paper. Tonite No. 2 is a variety of the foregoing, with the addition of charcoal. Tonite No. 3 consists of 19% of gun cotton, 13% of di-nitro-benzol and 68% of barium nitrate. It has a slower explosive action than some other varieties, and is better adapted for blasting in soft formations.

Men and Women Ore Sorters at Sirena Mine.—(See page 5.)

Roburite is a Sprengel explosive; that is, it consists of two component parts, non-explosive in themselves, but which, when mixed together, form a powerful explosive. Dr. Sprengel's idea was to mix the two ingredients together at the moment of use. This mode of procedure could not, of course, be adopted, as the user—generally a miner or a quarryman—would require to be a practical chemist. Roburite consists of ammonium nitrate and chlorinated di-nitro-benzol; nitrate of ammonia is dried and ground, the melted benzol added and incorporated with it until an intimate admixture is obtained. The compound is then made up into cartridges, which are waterproofed, roburite being deliquescent, due to the nitrate of ammonia. Its explosion can only be effected by a detonator. Securite is another explosive of the Sprengel class, and consists of a mixture of 26 parts meta-di-nitro-benzol and 74 parts ammonium nitrate. A variety of this explosive known as flameless securite consists of a mixture of nitrate and oxalate of ammonia and di-nitro-benzol.

Bellite consists of a mixture of nitrate of ammonia with di-nitro-benzol. It absorbs little moisture from the air after it has been pressed into cartridges while in a heated condition. Like roburite, it is a safe explosive as well as a powerful one. Another explosive of this class is ammonite, which consists of a mixture of ammonium nitrate, paraffine wax, resin and di-nitro-naphthalene. The nitrate is heated and pulverized while hot and mixed with the naphthalene. The mixture is then granulated, sifted and pressed into tubes, which are afterwards filled with the same composition in a granulated condition.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:
United States, Mexico and Canada........$3 00
All Other Countries in the Postal Union........4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN........Publisher.

Special Representatives:
EASTERN.
E. H. HAVEN........150 Nassau St., New York City.
MIDDLE WEST.
CHAS. D. SPALDING........153 La Salle St., Chicago, Ill.

San Francisco, July 7, 1900.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Ore Yards at Sirena Mine; Cars from Purisima Tunnel Starting Down Tramway to Mill; Men and Women Ore Sorters at Sirena Mine, 1. Mexican Miner—Cargadores, Tenateros (Ore Packers); Tramway Skirting Sirena Mountain, Connecting Sirena Mine with Mill; Stopes on Second South Drift, Sirena Mine, at a Depth of 1200 Feet from Apex of Vein; View of Stope, Sirena Mine, Showing Structure of Vein, Main Tunnel Level, Depth 1000 Feet; "Driving Ahead" in Sirena Mine, 4. Kia Oro Dredge Dredging Gold in a Butte Co., Cal., Orchard; The Marigold Dredge, Feather River, Cal., Showing Tailings; A New Forest upon a Waste of Rock and Gravel; A Stop for Dinner on the Hillside; The Quiet Pleasures of the Mountain Lake; A Wooded Hilltop Above a Rock Cut, 6. Latest Mining and Metallurgical Patents, 7.
EDITORIAL.—Precaution for Fires in Mining Towns; Must Learn by Experience; Incorporation of Mining Companies; Railroad Restriction; Miscellaneous, 2.
MINING SUMMARY.—10-11-12-13.
LATEST MARKET REPORTS.—14.
MISCELLANEOUS.—Dynamites and Their Manufacture, 1. Concentrates, 3. A Guanajuato, Mexico, Mining Enterprise; Gold Dredging at Oroville, Cal., 5. Summer Outing Scenes, 6. Latest Mining and Metallurgical Patents, 7. The Electrical Precipitation of Gold on Amalgamated Copper Plates; Ozokerite, 8. At the Paris Exposition; The Work Would Apply; Smelter Methods in Colorado, 9. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received; Recently Declared Mining Dividends; Mining School Graduates, 13-14.

THE 79th annual meeting of the American Institute of Mining Engineers will be held at Sydney, Cape Breton, and Halifax, Nova Scotia, August 21st–29th, under the auspices of the Canadian Mining Institute.

◆

THE recent Milwaukee Mining Congress made a mistake in indorsing the Torrens system of legal transfers. That system usually requires a guarantee fund to make good the blunders and mistakes growing out of Torrens titles. Legal titles to mining property are too uncertain and unsettled for any State or county to undertake to insure or guarantee Torrens titles to mining property.

◆

THIS paper is always pleased to receive and publish contributions of interest to its readers, and where deemed desirable illustrations, photos or sketches from which engravings may be made would be acceptable in further embellishment of the subject. Descriptions of appliances and records of experience are always interesting to readers everywhere, and oftentimes of great practical value.

◆

A MINING CLAIM is realty, and a man has a legal right to hold as many claims as he can do annual required work on; yet it is not wise to attempt to grab or hold the whole countryside. That is a habit and a bad one. A locality where one man or a few men hold nearly all the claims is not sought by investors, and wholesale claim holders thus defeat their own purpose. "Just doing assessment work" will keep a camp poor forever. It is development work that makes a camp, and a man who holds his claims to sell at a big profit, just as he would a corner lot in a rapidly growing town, must demonstrate intrinsic value or continue to be "claim poor."

◆

THE event of the week has been the advance in silver and lead, the former indicating withdrawal of deposits for export. In this regard it is of interest to note that New York City reports a greatly decreased number of outstanding silver certificates, thus indicating a cessation of speculation in silver on the Stock Exchange by means of such certificates. They have been so used since their introduction in 1889, but it would now appear that Eastern manipulators consider that the price of silver can be better sustained by control of the supply than by making the metal the subject of certificate speculation on the exchange.

Railroad Restriction.

California mineral development suffers from railroad restriction. In other States the railway companies advertise the resources of the area from which they draw support, rightly reasoning that their own prosperity will be proportionate to that of the country from which they naturally expect to get business. In California the Southern Pacific Company has always acted as though it were afraid that the State's mineral area should be exploited, a vigorous silence, a rigorous reticence being constantly maintained. For aught that great corporation emits no one would know that there was a mineral product in the State. Unlike any other commonwealth, whatever advance is made in the mineral development of the State is not made because of the railway company, but in spite of it.

Wherever it can it comes with a heavy hand on any California mineral producing industry. The latest from San Bernardino county is an example. In that county borate of lime is mined to the amount of about 900 tons per month, loaded at the mine in cars and hauled eleven miles by the borax company over its own road to Daggett, whence it is shipped to the refinery on San Francisco bay. It is considerable of an industry in a small way, one of those things that helps to develop a State, turning into money an inert mass. Formerly the marsh deposits of California and Nevada were the chief sources of borax. Mining and scientific development showed that the stratified rock formation of borate of lime in southern California could be made to yield profitably, by modern processes.

Till recently the freight rate from Daggett to the refinery—about half the length of the State—was $6.50 per ton. The S. P. Co. has raised the rate to $29 per ton. This, of course, is prohibitive, so the Alameda refinery must close. Meanwhile, if the San Bernardino county borax mines continue production the S. P. Co. will get the "long haul;" it will carry the crude borate to Galveston, Texas, over its "Sunset" lines. At Galveston it will be shipped by steamer to New York City—carried over 3000 miles, and at a freight rate cheaper than it would be taken from one California county to another.

This is not an isolated case, nor is the matter exaggerated. It is merely characteristic, and illustrates how mistaken policy retards and restricts the development of a State. Anywhere else such action would be impossible. It was supposed when the Santa Fe got its supplicated favors from San Francisco and the San Joaquin valley that that corporation would and could prevent the creation or continuance of such arbitrary action, but events in the last few weeks show that in California railroad operation combination is preferable to competition, and the cinch is tighter than ever.

◆

IT will not be uncommon to hear of fires in mills and mining towns for the next ninety days, and while disaster by fire is in a measure unavoidable, it would seem that most of the loss so entailed could be avoided by due precaution and the exercise of preventive measures. As usually built, many mining towns invite fire. The mine or mines that are the cause of the town's existence are usually at the head of a narrow canyon that widens down the grade and through which the wind sweeps. Should the fire start at the head of the canyon, it usually burns as long as there is anything left, for the fire protection is generally inadequate, and, despite heroic exertion, the disaster is often complete. The best protection against fire is to recognize its imminent probability and to have every procurable contrivance on hand to check it at the start. Time is worth about $25,000 a second during the first few moments after a fire is discovered—a well directed hand grenade or a stream from a chemical engine will do more to put a fire out in the first few minutes than a whole department after it has got under way. The manner of mill construction and the carelessness born of continued escape from the inevitable, make destruction more complete. There is nothing more likely to entail terrible loss in a mill or mine or mining town than fire, and nothing is more loosely guarded against in many instances. In mill construction, especially, in these days of better transportation, it is well to make all due provision against contingency of fire; it is more expensive to so build, but still more expensive to be burned out. One common mistake is in trying to get everything under one roof; then, if anything goes, it all goes, and the bigger the plant the greater the proportionate danger of such disaster. One thing is to be reckoned on: a fire is sure to start some time or other, and so far as possible the mill should be so arranged that when fire does break out, even if it can not be got under control, it will not consume the entire building.

Must Learn by Experience.

Now that the northern transportation boom has been worked for all it was worth it ought not to be necessary to continue daily statements at so much or so little per published line concerning the return of men with "big bags of gold" in their possession. The truth has been told in these columns about those northern gold fields, but many people want to believe what they themselves imagine. It is occasionally surprising what silly stuff men will believe, men who are ordinarily intelligent enough to discriminate. The following from the Juneau (Alaska) Dispatch of the 23d ult. is illustrative:

> The Alaska Commercial Company's steamship Excelsior arrived this morning from Valdes, Cook's Inlet and the Westward. She carried a number of passengers bound for the south. Among them was Dr. W. D. Northrup of San Diego, Cal., who, with some twenty other residents of that vicinity, says he was induced to go to Yakutat bay by stories of beach and gulf sands that carried 18 ounces of platinum to the ton, besides sufficient gold to pay all working expenses. These stories were told the San Diegans by two prospectors, who wintered last year at Yakutat and who claimed to have lost all their stores in the tidal wave of last autumn. They sold claims to many of the party at various prices, in one instance securing $600 for a one-fourth interest. The buyers will now dispose of these claims at a very low figure. Dr. Northrup says that 360 tons of these sands will produce one ton of concentrates, carrying an ounce of platinum and $4 in gold. There is only one mine at Yakutat and it produces less than $1.50 a day to a man. The party spent two months discovering this sad fact, and they are now returning to San Diego. They are trusting that they may get there before the two prospectors leave.

◆

THE fact that incorporated mining companies in this country paid over $40,000,000 in dividends during the first half of this calendar year will attract considerable attention in the East, where investors will contrast such showing with the unprofitable 150,000 miles of railroad, with over $10,000,000 liabilities. It is a most favorable showing, and will go far toward substantiating the claim that the mining industry, compared with other industries, has paid more dividends than any other. In the $40,000,000 are only announced dividends of incorporated companies. That aggregate falls far short of the total, for there are many companies profitably engaged in mining who make no announcement. This is largely due to the old fear in all competitive industries that some competitor would find out how profitable the business was, and so hurt him who proclaimed his prosperity by cutting into his profits. Such reticence is a survival of former fear in that regard, a fear that should be groundless in the one industry of all others that has least to dread from competition, and that depends for its progress largely upon the increase of the number devoting attention to it.

◆

NEXT in importance to California of the discovery of gold is the present exploitation of its oil wealth, supplying the one lacking requisite of cheap fuel, and making possible an era of manufacturing. And when is considered the variety of bye-products procurable from petroleum, it is manifest that even fuel supply may become secondary in commercial importance to the value of the articles derivable from the crude petroleum now being pumped so abundantly throughout a large area of the State.

◆

IT has been often said with considerable truth that a foreigner could live on what an American threw away. While this is true in many instances the saying does not apply to machine methods, to mining or manufacturing, to industrials in general. American manufacturers and engineers practice an economy in materials and labor that is unequalled abroad, and in no country are more economical methods of production than in the United States.

Concentrates.

THE diameter of a pipe is measured from the inside: that of a tube from the outside.

ALKALI in the water will turn cylinder oil milky if there be 5% or more of animal oil in it.

FOR heat purposes one pound of petroleum is reckoned equal to two pounds of bituminous coal.

UNDER a recent decision of the General Land Office mining and smelting are two distinct industries.

MILL TAILINGS at the Alaska-Treadwell mill, Douglas Island, Alaska, assay from 10 to 15 cents per ton.

SILVER 71.89%, copper 28.11%, gives an alloy that has a lower melting point than any other silver-copper compound.

THE number of miners employed in California in 1897 is officially reported to have been 16,763; in 1898, 19,823; in 1899, 24,991.

LITHIA is used a little in medicine. Lepidolite contains it; plenty of that mineral is available in California, but there is no demand for it.

AN Arizona county recorder's legal charge for recording a notice of location of a mining claim is $1.50; this includes filing, seal and all necessary.

TO FIND quantity of water elevated in one minute running at 100 feet of piston per minute, square the diameter of water cylinder in inches and multiply by 4.

WHIN is the Scotch term for quartzite. Quartzite may be commonly considered as a sandstone in which the crystals have disappeared by becoming indurated.

UNDER Colorado laws it is optional in organizing a mining corporation whether the stock shall be assessable or not. In California mining stock is always assessable.

THE tannic acid from oak wood is not a good boiler scale eradicator. It will attack the scale, but will also attack the boiler, and its use will be likely to honeycomb the tubes.

A MINING location made upon land already patented initiates no right. A patent may be attacked when it is void upon its face, or is prohibited by statute, or is based upon erroneous rulings of law.

ONE THOUSAND GALLONS OF WATER per hour constantly flowing under a 6-inch pressure is equal to 1¼ inches, miner's measurement. The same amount flowing without pressure is equal to 2½ inches.

IN the administration of the public lands the decision of the Land Department upon questions of facts is conclusive, when brought to notice in a collateral proceeding, and it is only questions of law which are reviewable by the courts.

UNDER a rule of the General Land Office a contract for more than $5000 cannot be awarded to a single surveyor, for that is supposed to be as much work as he could do within the time allowed for the completion of the whole survey.

THE Carson, Nevada, mint began coining in 1870; stopped May 22, 1893. Its largest coinage amount was in 1876—gold, $2,850,215; silver, $3,552,000; total, $6,402,215 for that year. Its total coinage was: gold, $23,829,425; silver, $25,445,009.30; total, $49,274,434.30.

PYRITIC SMELTING comprises the smelting of raw pyritic ores direct, in a blast furnace without the use of carbonaceous fuel, utilizing as a source of heat the oxidation of part of the sulphur and iron contents of the ore itself. Pyrrhotite and chalcopyrite may serve instead of pyrites for this purpose.

FOR calculating the capacity of any piston pump, multiply the area of bore of cylinder of pump by the length of stroke, and that result by the number of strokes per minute the pump is working. This gives the quantity of water in cubic inches; dividing this by 231 gives a total capacity of pump per minute in gallons and fractions of a gallon.

WITH care there is little danger of poisoning from cyanide. The chief source of possible trouble in that regard would seem to be that insoluble cyanide salts—cyanide of zinc—for instance, may mix with the slimes, not being well washed out, thus forming hydrocyanic gas when sulphuric acid is poured on. In case of inhalation, a prompt subcutaneous injection of hydrogen peroxide will be effective antidote.

NO PUMP will draft hot liquids any distance, for the reason that the vapor or steam rising from the liquid passes through the suction pipe into the pump and fills it with vapor instead of water. Therefore, for pumping hot liquids the pump should be placed as near as practicable, forcing the liquid upward instead of lifting it by suction. A hot water pump always requires metal valves throughout.

THERE are several simple tests for feed water, any of which can be used by those in charge of steam boilers. The hardness or softness of water is easily determined by dropping a little alcohol that contains soft soap to saturation. If the water is hard it will turn milky white, but will remain clear if it is soft. For carbonate of lime, five to ten drops of oxalate of ammonia should be added to the water in a test tube; if lime be present the water will have a clouded or milky appearance, and after standing a few hours a precipitate will be found at the bottom of the tube. A few drops of nitrate of baryta will reveal the presence of sulphate of lime or sulphuric acid, by forming a white precipitate. When a drop of permanganate of potash is put into the water, it colors it to a bright violet rose color at first, but if decomposed organic matter is present the color changes to a dull yellow. If iron is held in solution, a few drops of a solution of prussiate of potash produces a blue color in the water.

TO make a spark coil for a gasoline engine, to be used either in connection with a battery or a 50-volt direct-current circuit, wind about three pounds of No. 14 wire on a one-inch core of soft iron wire. Use four or five cells of a good sal-ammoniac battery, or a larger number of potash cells. Connect a 50-volt lamp in series when current is taken from a 50-volt lighting circuit; if a 16-candle power lamp does not give a large enough spark, use a 32-candle power.

IN August, 1873, the average London price of silver per ounce standard (0.925) was 59 pence; equivalent value of ounce fine with exchange at par, $4.8665, $1.29334, equivalent value of ounce fine based on average price of exchange, $1.28186; bullion value of a U. S. silver dollar at average price of silver, exchange at par, $1.00031; commercial ratio of silver and gold, 15.98. At current London silver quotations the above figures would be .62196, .62323, .48104 and 33.23, respectively.

METAPHYSICAL and psychical discussion are doubtless fascinating forms of research to some minds, but the only idea in this page is to answer as accurately as possible questions that come up in the daily lives of our readers; questions that are often on the lips or in the minds of many, who see in some answer the very thing they were going to inquire about. It is neither our province nor our purpose to start any argument or discussion on imaginary or fanciful topics, but to try to make practical answer so far as possible to questions of general interest.

THERE is no uniform rule or rate regarding assaying. An "assay" will cost from 50 cents to $5, according to what kind it is. The regular California rate for a common, ordinary assay is $2; in Colorado, $1.50. Yet, were a miner to take a bunch of forty or fifty assays to a Colorado assayer he would probably get the lot done for 75 cents each. The same discount would likely prevail under the same conditions in California or elsewhere. The University of Arizona does assay work and charges for it. Arizona assayers pay taxes to support an institution that enters into direct competition with them.

THE area (a) of the base of a regular vessel, the eighth (h) of the fluid in feet, and the weight (w) of a cubic foot, the fluid being given, required the pressure (p) in pounds on the bottom of the vessel—$a \times h \times w = p$. The height (h) of a column of fluid in feet, and the weight (w) of a cubic foot being given, required the pressure (p) in pounds of the column per square inch—$h \times w \div 144 = p$. The diameter in feet of the base (b) of cylindrical reservoir, and the depth in feet (d) of fresh water contained therein being given, required the pressure (p) in pounds upon the staves—$b \times 3.1416 \times d \times (d \div 2) \times 72.5 = p$.

THE Supreme Court of the United States—102 U. S., 167—in the case of the Ivanhoe M. Co. vs. the Keystone, established the doctrine that Congress in making grants of school lands to the several States did not depart from the policy of reserving mineral lands from sale, and that mineral lands found within a sixteenth or thirty-sixth section, known to be such at the time the grant took effect, did not pass to the State. The Secretary of the Interior and the General Land Office, by a uniform line of decisions, have held that mineral lands do not pass to the State under the school grants from the Federal Government.

IN working a double acting pump, which is equivalent to two single acting pumps of same diameter, double the power would, of course, be required, and double the water would be discharged. It is immaterial whether the water is raised with a large or small pump, as the theory is that it requires a given quantity of power to raise a given quantity of water a given height in a given length of time. Of course, if the pump is large it must be worked slowly, and, if small, it can be worked faster; the power required to work a small pump fast is the same as to work a large pump slow, for the same given height and quantity.

TO FIND the head in feet due to friction in a pipe running full, multiply the length of the pipe in feet by the square of the number of gallons per minute, and divide the product by 1000 times the fifth power of the diameter of the pipe in inches. The quotient, less 10%, is the head in feet necessary to overcome the friction. Example: A pipe 4 inches diameter and 4000 feet long is to deliver 200 gallons per minute; what head of water in feet is equivalent to the friction? $\frac{LG^2}{1000\ D^5} - 10\% = \frac{4000 \times 40{,}000}{1000 \times 1{,}024} - 10\% = 156 - 15 = 141$ feet.

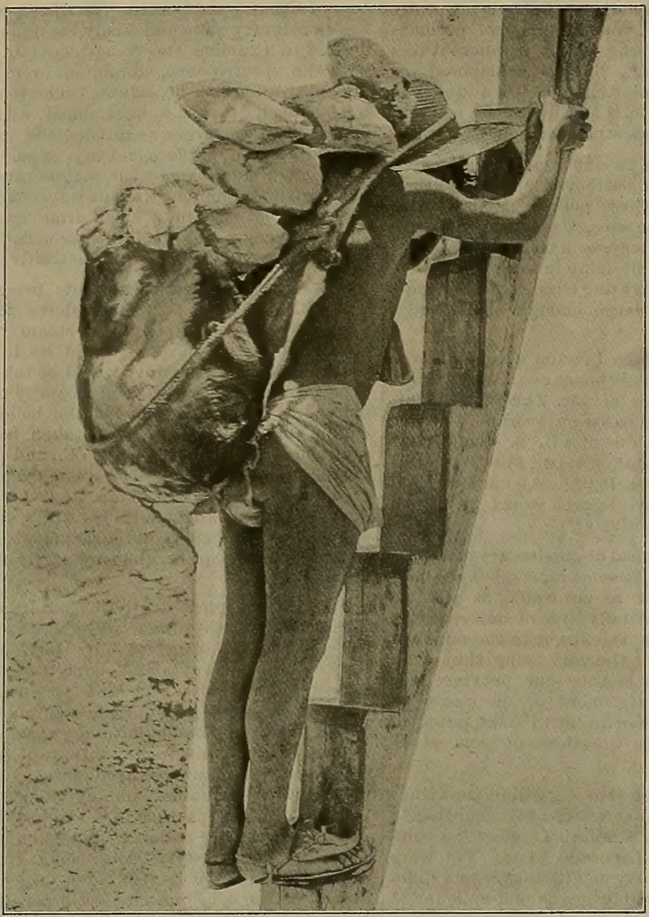
A FINE form of blowpipe reduction may be effected as follows: Flatten out a very small piece of metallic sodium on a fragment of filter paper; in this roll up the substance to be examined and wind with a close spiral of finest iron wire. After the excess of paper is cut off, slowly burn the roll in the interior of a Bunson flame and cool in the stream of gas close to the top of the burner. The product is then treated with a little water in an agate mortar, when the caustic soda formed is quickly dissolved and any metal present is left, generally in quantity large enough for easy examination. Sulphur and other substances are readily detected in the solution. In case of silicates and borates, the silicon or boron is left in the elementary state and easily recognized. In case it is desired to examine the constituents of the substances with the spectroscope, aluminum or magnesium filings are substituted for the sodium. The reaction is violent, but, in small quantities, unattended with danger. If it is desired to use larger quantities, the substance must be diluted with an indifferent body, as salt when sodium is used, magnesium oxide with magnesium and aluminum oxide with aluminum. In this way considerable quantities may be used in a small iron crucible, and thus silicates decomposed in a few seconds. With care the process is even available for quantitative work.

STEAM at 100 pounds absolute pressure has a total heat of 1213 degrees per pound above zero, or 1181 degrees above 32. The weight of steam passing through an engine for this purpose would be $1{,}000{,}000 \div 1181 = 846.7$ pounds, and the duty would be taken for the time it requires for 846.7 pounds of steam to pass through the cylinder. If the test included the boilers as well as the engine, and the feed water was taken from the hot-well at a temperature of 112 degrees F., and passed through a heater supplied with exhaust steam from an auxiliary engine and the boiler feed pump, it would be raised to 212 degrees, thus calling for $1213 - 212 = 1001$ degrees to be supplied by the boiler, and 1000 pounds under these conditions would require almost exactly 1,000,000 British thermal units.

THE Pittsburgh Reduction Co., at its aluminum works, uses about as large rotary converters as any manufacturing concern. They are made by the General Electric Co. A two-phase current is first reduced by transformers to a pressure of 115 volts. At this pressure it is led into the converters, which give out the continuous current at 160 volts; the plant having a total capacity of over 10,000 amperes, equivalent to an output of about 2000 H. P. The G. E. Co. makes a three-phase converter, a 16-pole 600 kilowatt machine running at 188 revolutions per minute. In this machine the pole-breadth is 72% of the pole-pitch, yet the ratio of conversion is 71.8; the voltages at the respective sides being 115 and 160. The armature diameter is 100 inches, the core length 8.25 inches, giving 4.3 square inches of peripheral surface per kilowatt. The temperature rise after 17 hours with a conversion output of 575 kilowatts was 15° C. in the armature, 23° C. in the field magnets. The average flux-density in the gap was 69,000 lines per square inch.

THE power necessary to raise water depends upon the height to be overcome and the quantity to be delivered. A gallon of water weighs about 8½ pounds; consequently, if ten gallons of water are required to be lifted 1 foot per minute, 85 pounds power will be exerted; and the same proportion will remain as the height is increased. The following formula will be found useful in determining the necessary power to work one pump: Having found the number of gallons desired per minute, multiply this number by 8.35 (weight of one gallon of water); then multiply the product by the height in feet to which the water is raised, and it gives the number of foot pounds. Divide the product by 33,000 (1 H. P.), and the result is the horse power, or its fractional part, required to do the work. To this a liberal allowance must be added for friction—say, 15%. A 1 H. P. steam engine will elevate 50% more water than a single horse working on a horse power. It is essential that the inlet or suction pipe to a pump should be air-tight to secure its successful operation. The theory is that water can be raised by suction about 33 feet perpendicular height, but, practically, 20 feet is all it is safe to recommend. The diameter of the suction pipe should not be less than about half the diameter of pump cylinder. When the suction pipe is near the extreme limit of, say, 20 feet vertical height, it should be even larger than this. Suction pipes may be extended almost any distance horizontally; where this occurs a check valve is desirable. Elbows or short turns should be avoided as much as possible in either suction or discharge pipes.

THE high expansion ratios used in compound and mulple-expansion engines, and the high temperature of steam at 160 to 180 pounds pressure unite to cause a greater range of temperature in the cylinders than formerly. These conditions make the internal losses important, and it is to superheating that the steam engineer looks for help to reduce these losses. Many of the old objections to superheating may now be met in a manner formerly not possible. Improved lubricants, capable of resisting the action of high temperatures, are to be had; the best forms of metallic packing require less lubrication than was formerly needed, and the superior workmanship of modern engines assists in rendering smooth operation possible. Excessive superheating is by no means necessary. When the steam is heated 75° to 80° F. above the temperature due to its pressure, an excellent economy is produced without injury to the working parts, the saving usually ranging about 20%. With engines normally requiring 14 to 15 pounds of steam per horse-power hour, the consumption with 75° superheating falls to 11 and 12 pounds respectively; while for engines especially constructed for use with high degrees of superheat, the steam consumption per horse-power per hour has fallen 90 pounds. The principle that steam cannot be superheated until it is removed from the boiler in which it was made, probably holds good for steam that is in a quiet state, but in some upright boilers now in use, as the tubes extend above the water line and are filled with heated gases, the steam as it passes these becomes superheated on its way to the steam pipe, but such steam is in reality removed from the water, although still in the same boiler.



Mexican Miner—Cargadores, Tenateros (Ore Packers), Noted for Their Powers of Endurance and Carrying Capacity; Their Usual Loads Vary From 225 to 350 Pounds, Sometimes Running as High as 450 Pounds.

A Guanajuato, Mexico, Mining Enterprise.

NUMBER II.—CONCLUDED.

In last week's issue was given some general account of the modern exploitation of ancient mines in the State of Guanajuato, Mexico. On the front page of this issue, and the page opposite this, are further interesting views in and around the Sirena mine, which is one of the properties now being developed in accordance with up-to-date mining methods by the Guanajuato Consolidated Mining & Smelting Co., whose main office is No. 35 Wall street, New York City.

The Sirena mine is located ½ mile from the city of Guanajuato. It has been worked for over 100 years. It was formerly worked through a vertical shaft, which was sunk to a depth of 900 feet. At a depth of 450 feet this shaft cut the ledge, which dips at an angle of about 45° to the west. At this point a level was run and stoping began above this level. In 1856 a crosscut tunnel was run for a distance of 2000 feet and cut this shaft at the above-mentioned 450-foot level, since which time the mine has been worked almost entirely above this level, as the crude hoisting plant made it very difficult to keep the water out of the lower levels. A drift was run on the vein from this shaft 3000 feet. Stoping had been done at intermediate points all the way from one end of this drift to the other, and up to 1897 work was still being done in these drifts above the present level, the lower workings being entirely submerged with water. The richer ore in the upper stopes has been extracted. There is considerable low-grade ore left unstoped, going about 26 to 30 ounces silver and $3.50 to $10 gold. The vein is composed of quartz, which carries lime and feldspar. The gold is present in sulphides of iron, best treated by concentration. The silver is in the form of sulphide of silver.

In 1899 H. P. Sellon made report on the entire property, in which he cited the fact that Mexican mines and their method of management are so entirely different from the general character of mining in the United States that the system has to be explained to understand why large bodies of ore have been left in the mines and not worked by former owners. As was explained in last week's issue, an ore of a value of $20 is not worked at a profit to both the mine and hacienda (custom mill), owing to the cost of treatment at the hacienda and tributary systems adopted at the mines, besides the want of machinery and equipment to save the cost of hauling and handling, though under modern methods there would be a profit to the mine and the mill. The tribute system is in vogue, the miners getting 50% of the value at the hacienda after the charges are paid. Nearly all work is done by man and mule power, which takes much time and makes it difficult to obtain large output. The patio process of treatment is slow and expensive, ore sometimes taking from three to six weeks to treat under this process, which, though good for silver, is bad for gold, only 30% of gold value being saved, all gold in sulphurets being entirely lost. When Mr. Sellon made his report the cost of working on the patio was high, ore grinding alone costing $5 (Mexican), and the working of the ore on the patio, chemicals, sampling, assaying seldom costing less than $5 more, besides cost of general manipulation, making, altogether, cost of treatment $14 to $17 per ton, or nearly twice that of modern milling. A large hacienda with twenty arrastras can only handle about 18 montones, or 28 tons, a day, and the ore, after crushing, must be worked on the patio for two or three weeks, sometimes thirty days, according to the class of ore. With modern machinery the ore ought to be ground up for $1.50 (Mexican) and treatment should not cost more than half as much.

Taking an ore value of $51, for instance, it can be seen how the cost of working cuts down profit. The value of $51 (Mexican) ore would be as follows in the mines under discussion:

Silver	$36
Gold	15
Silver value saved in the patio	$30
Gold value saved in the patio	5
Total	$35
Hacienda charges for treatment	17
Balance	$18
Miner's tribute	9
Balance	$ 9
Hauling ore to hacienda	2
Gross profit to mine	$ 7

After paying superintendents, timbering or stone pillars, supplies, etc., the mine was practically robbed of its profits, while the hacienda made, with its enormous charges, a good profit for treatment.

The scale of wages in Guanajuato at the time was as follows:

	Per day, Mexican.
Assayers	$.50
Machinist	1.50
Miners, first	$0.75 to $0.85
Miners, second	0.60
Day laborers on surface	0.25 to 0.30
Superintendents (Mexican)	5.00
Blacksmith	1.50 to 2.00
Carpenters	1.00 to 1.50

In the patio process the ore is crushed in a Chilian mill, to go through a screen having four meshes to the inch. It is then taken to the arrastras, where it is ground fine with water, mercury there added, and all free silver and gold amalgamated. In those ores little of the gold or silver is free. The remainder is carried on to a paved open courtyard, or patio, where it is mixed with water to the consistency of a thick mud and treated with salt, sulphate of copper and hydro-sulphate of soda. This mass is continually turned, mixed by mules treading it for two or three weeks—sometimes longer, according to the character of the ore. When the ore is adequately desulphurized, and the silver formed into a chloride sufficiently to amalgamate, it is sent through a settler and the amalgam caught and retorted.

The mining laws of Mexico limit the working of a vein to that portion which the boundary lines of the claims cover when extended vertically downward, so that in order to secure a long-lived mine it is necessary to have the locations not only cover the apex of the lode, but also very extensively cover the territory on its dip.

M. E. MacDonald, the company's local manager, reports regarding the Sirena mill and mine:

"In starting up our plant we followed the methods now in use at the different mills at Pachuca, where they treat ores of a similar character to ours. During the month of October, 1899, our expenditures for supplies, labor, etc., were as follows in Mexican money:

569½	Kilos quicksilver	$ 1,400.97
6,138	Kilos sulphate of copper	1,902.78
17,000	Kilos salt	338.94
	Fuel—Coal and wood	3,447,57
	Castings, Oil and supplies	1,420,96
	Total cost supplies	$ 8,511.22
	Total cost Mexican and American labor	1,764.07
	Total cost operation of plant	$10,275.29

"The number of tons of ore treated during October was 1345, dry weight, and calculating from this amount shows the following statistics on the proportional cost per ton of ore treated:

		Cost.
0.42	Kilo quicksilver	$1.04
4.57	Kilos sulphate of copper	1.41
12.64	Kilos salt	.25
	Fuel—Coal and wood	2.56
	Castings, oil, etc	1.05
	Labor—Mexican and American	1.30
	Total cost per ton of ore treated	$7.61

"Our total output of bullion for this month was twenty-five bars, with a net value of $19,615.07.

"In the month of November we made the following expenditures for supplies, labor, etc.:

648	Kilos quicksilver	$ 1,694.08
8,793	Kilos sulphate of copper	2,725.83
20,756	Kilos salt	456.63
	Fuel—Coal and wood	4,020.00
	Cyanide	88.60
	Castings and supplies	601.79
	Total cost of supplies	$ 9,586.93
	Total cost of labor	1,672.88
	Total cost of operation of plant	$11,259.81

"The bullion produced during this month was twenty-five bars, with a value of $18,908.48. In this month we treated 1430 tons of ore, and calculating with this amount as a basis shows the following items of expense—proportional cost per ton of ore treated:

0.45	Kilo quicksilver	$1.18½
6.15	Kilos sulphate of copper	1.90
14.50	Kilos Salt	.32
	Cyanide	.06
	Fuel—Coal and wood	2.81
	Castings, oil, etc	.42
	Labor	1.16½
	Total	$7.86

"Our percentage of extraction of the value in the ore for the above month was 74½, or a total extraction in bullion of $18,908.48.

"The extraction book shows the December mill run to have been as follows: Time, thirty days; 1200 tons milled; silver value, $17, Mexican; gold value, $5.20, Mexican; total per ton, $22.20, Mexican (= $11.10 United States coin); tailing assays, Mexican silver, = $3.56; gold = $0.65; percentage of extraction = about 81; total value bullion, Mexican currency, =$22,145.24; net value, $20,049.31; total milling expense, $9461.70, = $7.88, Mexican, per ton, divided as follows:

.561	Kilo quicksilver	$1.59
2.620	Kilos sulphate of copper	.78½
13.000	Kilos salt	.29
.068	Grams cyanide	.09½
	Coal and wood	2.93
	Sundries	.32
	Labor	1.87
	Total proportionate cost per ton	$7.88"

Concerning the first south drift of the Sirena mine, illustrated on the opposite page, showing the Mexican miners at work, Mr. MacDonald says:

"At present the remains of this enormous body of ore are being worked on the "buscone" plan, viz., each crew of Mexican miners is allowed a certain section of stoping ground, where they mine ore at their own expense and sell the same to the company on the following conditions: First, one-half the entire lot of ore is taken by the company outright; second, the balance is liquidated in the following manner: A treating charge, or 'maquila,' of 508 grams silver, or $20.32, is deducted from the value per ton metric, and then the balance is paid for by the company on the basis of figuring silver at $0.90 per ounce and gold $6.17 per ounce, Mexican currency."

Of the vertical shaft of San Miguel Manager MacDonald says:

"This main working shaft was sunk by the ancient miners in the year 1802, and has a total depth variously stated to be from 825 feet to 1050 feet, and a diameter of 16 feet, octagon shaped, which is walled up with masonry to a depth of 614 feet, and from there down the rock is solid and does not need support. This shaft connects with the deepest workings in the mine, and was for a long time filled with water nearly to the main tunnel level above mentioned. This water has been hoisted and the workings drained to a depth of 325 feet below the main tunnel."

Gold Dredging at Oroville, Cal.

Written for the MINING AND SCIENTIFIC PRESS by H. G. PARSONS.

With Oroville as a focus, gold dredging operations are being extended into contiguous territory and to the auriferous ground of other streams beside the Feather river. The locality below Oroville is exceptional in its formation, and will continue to be the seat of great activity in dredging operations. It is here that the Feather river breaks away from the mountains. The waters have been laying down in ever-changing channels loose, gold-bearing gravels, which underlie the present surface of the country. Some of these channels were discovered in the early fifties; more are now being located by prospectors for the dredger companies, and machines are being built and placed so as to reach these later discovered channels. It is not necessary that the dredgers be upon the river or any small tributary; they can be worked miles away from the stream, provided that a pit be dug of sufficient size to accommodate the machine after construction, that this pit be filled with water and that a sufficient supply of fresh water be added to keep up the operations of the machine. In a country ramified by irrigation or mining ditches, like Butte county, these conditions are easily filled. Most of the new enterprises are away from present water courses, but at points where prospecting operations have demonstrated the existence of good placer ground.

Two types of dredgers are in use, one of these being of the steam shovel or dipper class, the other of the Risdon or Postlethwaite type. These dredgers are provided with a system of buckets fastened to an endless movable chain, which passes over sprocket wheels at the end of an arm, held against the bottom or side of the gravel pit, where the buckets scoop up the gravel and convey it to the center of the boat, where it is dumped into a hopper, the fine gravel separated from the cobbles, the latter dumped outside the boat, the gravel elevated by a centrifugal pump and made to pass over riffles and plates, thence into sluice boxes, where about all the valuable material is saved. Although varying somewhat in detail, the working principle is the same in all the dredgers. The main point is to scoop up the gravel and extract the gold before the gravel is again dumped into the waste pile.

The Feather River Exploration Co. is the most extensive in its operations of any concern now at Oroville. It has three dredgers at work at different points along the west bank of the Feather, all of the Risdon type. One of these—the last constructed—is of greater capacity than its predecessors and requires 100 H. P. for its operation. Capt. Thomas Couch, the president of the company, was one of the first to take up this line of dredging in California, and has had one of the machines in operation since March 1, 1898. John J. Homlyn is secretary and assistant manager; Aug. Berner, superintendent. This company owns over 1000 acres in the heart of the auriferous deposit.

The Marigold Dredging Co., composed of New York men, under the management of Bond Thomas, is operating a dredger of the Risdon type close to the stream, opposite the Feather River Co. Their machine is under the direct superintendence of George Telford, who had experience in dredging operations in New Zealand under Mr. Postlethwaite. The operations of this company have been profitable; they are building another machine double the capacity of the first. They have been working since April, 1899.

The Continental Gold Dredging Co. has successfully started the largest machine yet installed in the State. It is of the Bucyrus type, using the endless chain and bucket, similar to the Risdon machine in its method of scooping up the gravel, but its system of washing the gravel and disposing of tailings is different. The operations of this company are in a pit near the Feather river. No expense seems to have been spared in making the equipment of this machine as perfect as possible. The motive power is entirely electric, and 300 H. P. will be required. This will be developed through four different motors. Frank Griffin is superintendent for this company.

The California Dredging Co. is operating a dredger of the dipper type in the Feather river, two miles below Oroville. This dredger is virtually a large steam shovel, mounted on a hull and fitted with gold-saving apparatus. The dredger Plutus, owned and operated by J. W. Ferris and associates of San Francisco, is of similar type, and until recently was at work in the river near the site of the Feather River Exploration Co.'s plant. The Plutus was probably working in poor ground. It is now being dismantled and will be taken to Rogue river, Oregon.

The Kia Ora Dredging Co. is operating a dredger of the Risdon type in a landlocked pit 1 mile from the river and 4 miles or more below Oroville. This dredger is under the direct management of R. H. Postelthwaite, the designer and builder of this type of dredger. It was one of the first enterprises to start operations so far inland, and after a successful run of several months has demonstrated that these machines can be manipulated with a limited water supply.

The Oroville Dredging Co. is the latest in the field, and is constructing necessary buildings at its seat of operations ½ mile from the river, and will soon begin building one or more of the dredgers it proposes to put in operation. These dredgers will use the Marion steam shovel built at Marion, Ohio, in a machine of special construction for this work. It is estimated that each will handle 1500 cubic yards of gravel in twenty hours' work.

The company owns 360 acres of ground, part of it being along a gravel channel that yielded largely in former years. It has been demonstrated by prospecting that the channel was little more than scratched by the early placer miners. E. Peabody and Henry E. Vail will have direct charge of the dredgers of the above company.

W. P. Hammon is one of the pioneers in dredging operations at Oroville. He has been actively identified with and has efficiently promoted some of the most successful enterprises. He is now stimulating the operations of a company which is about to build a dredge 3 miles from Wheatland, near the bank of Bear river. The project is but an indication of the manner in which dredging enterprises will be spread, all being locally inspired by the success attending this species of mining at Oroville.

Summer Outing Scenes.

Fourth of July week, with thousands of city people out of town, and thousands of country people forsaking scenes of rural activity for the wilds of lake, mountain and forest, affords a proper occasion for turning our pictorial attention away from the lines chiefly pursued. A few camera shots of outing scenes are therefore offered herewith.

It seems to be a general complaint that the more retired avenues of vacation travel and repose are scantly peopled this year. It does not seem to be a good summer boarder and summer travelers' year. There are perhaps several reasons why local resorts should be neglected. In the first place the times are full of action. People are, as a rule, busy about important concerns which promise reward for effort. There is a shortage of labor supply, and many who could steal time for recreation while their affairs proceeded under others' care, have this year to do their utmost to promote their own undertakings. Again, it is a time of unusual interest in distant activity. A large number of those with longer purses are doing Europe and the Paris Exposition; many more are seeking long purses at Alaskan points; there are hundreds of Pacific Coasters in our new Oriental possessions. Last of all, perhaps, it is a general election year and candidates and their friends are very busy pipe-laying and fence-building. All these distractions and others akin to them are reducing the numbers of those who seek recreation for its own sake and decimate the ranks of summer idlers.

And yet the delights of air and water, forest and mountain, are being enjoyed by many, and the charms of changing scenes are not less to those who are now pursuing them. Our pictures are suggestive of some phases of far western summering. The rolling hills, with the mountains beyond, afford a breadth of view which is inspiring and uplifting. The piles of rock refuse thrown up by some hilltop engineering bespeak the power of man to surpass mountain barriers, and the waste of rock and gravel which nature is endeavoring to conceal with forest shows the repairing by which Mother Earth covers her scars wherever such work is possible. Two other pictures relate more directly to outing—the boats upon the lake, the temporary camp upon the hillside—and need no comment to those who are now tasting or have enjoyed these recreations.

A New Forest Upon a Waste of Rock and Gravel.

The Quiet Pleasures of the Mountain Lake.

A Wooded Hilltop Above a Rock Cut.

Doubtless it is well to seek rest and recuperation. One can hardly see a camp of city children, done to a brown by the warm kiss of the sun and hear their happy cries as they pursue unwonted pleasures in the lake or the woods, without feeling that there will be brighter eyes turned upon the books when the schools reopen and bodies better fitted to resist weakness and take on strength during a whole year afterward. What is good for the children is also good for the elders—respite from pressing duties, hunger born of the tonic of the country air and long, sound slumber caused by physical weariness amid conditions which make such weariness a blessing—all these are strong agencies to repair the nerves, sweeten the temper and lessen the gravity of life's burdens. Fortunate are they who can adopt such remedies.

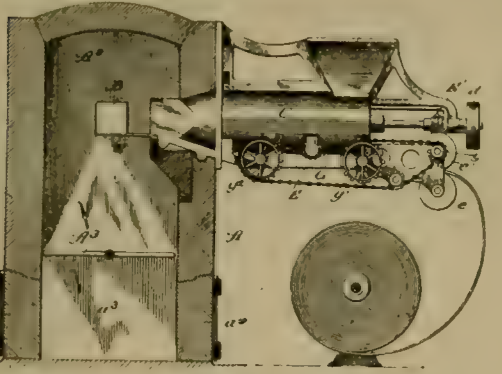
A Stop for Dinner on the Hillside.

Mining and Metallurgical Patents.

Patents Issued June 26, 1900.

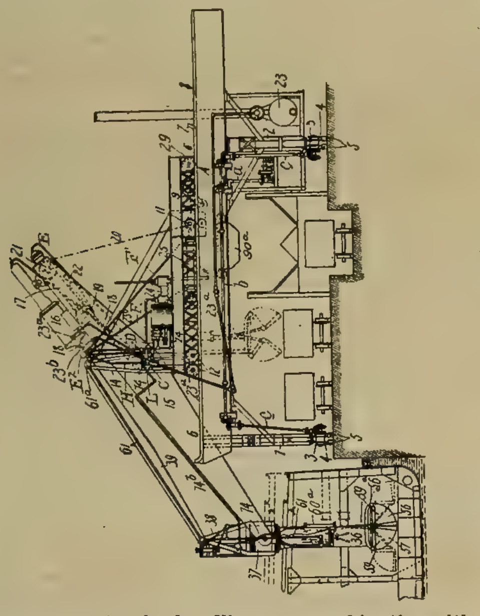
Specially Reported for the MINING AND SCIENTIFIC PRESS.

FURNACE FOR PRODUCING CALCIUM CARBIDE.—No. 651,916; J. Zimmerman and I. S. Prenner, Chicago, Ill.



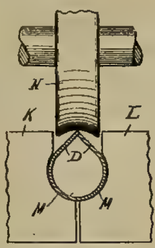
An electric furnace, combination of feed cylinder having discharge or mouth in horizontal plane in line with arcing space of two laterally standing electrodes, means for forcing material from feed cylinder, guide slot or passage in body of feed cylinder leading from exterior to mouth or discharge, strip of flexible material passsing through slot or passage of feed cylinder out at mouth along bottom of mouth forming traveling support carrying material from mouth of feed cylinder to and between electrodes into arcing space, means for advancing strip of flexible material coincident with feed of cylinder to pass beneath feed discharge and electrodes.

APPARATUS FOR HANDLING ORE.—No. 652,313; G. H. Hulett, Akron, Ohio, assignor of one-half to the Webster, Camp & Lane Machine Co., same place.



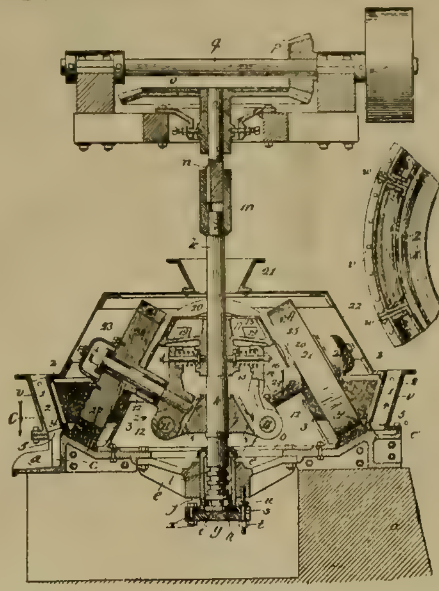
In an apparatus for handling ore, combination with trolley, walking beam thereon, cylindrical seat carried by outer end of walking beam, tower secured to seat and equalizing bar pivoted to upper end of tower and to beam-supporting frame on trolley, of leg mounted to turn in cylindrical seat, scoop carried by lower end of leg, motor for opening and closing scoop, motor for tilting leg and motor for tilting beam, series of actuating rods located within leg, devices connecting rods with valves of several motors and levers for actuating rods.

PROCESS OF MAKING TUBING.—No. 652,658; F. F. Bischoff, Chicago, Ill.



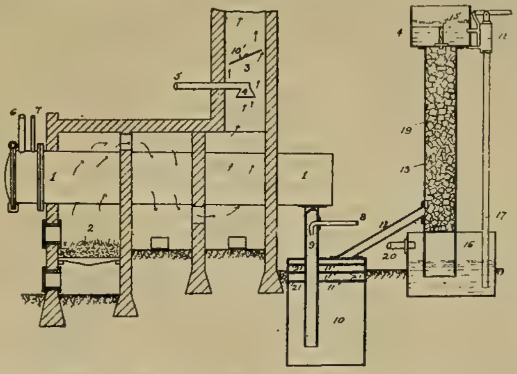
Process of making tubing from sheet metal which consists first in bending strip of sheet metal to form of channel bar having flat web, round corners and flat diverging flanges, subsequently bending web on curve tangential with corners and converging flanges, then forcing flanges together at their edges and simultaneously contracting curvature of web and round corners to radius less than that of finished tube, subsequently bending flanges.

PULVERIZING MACHINE.—No. 652,329; G. Raymond, Chicago, Ill.



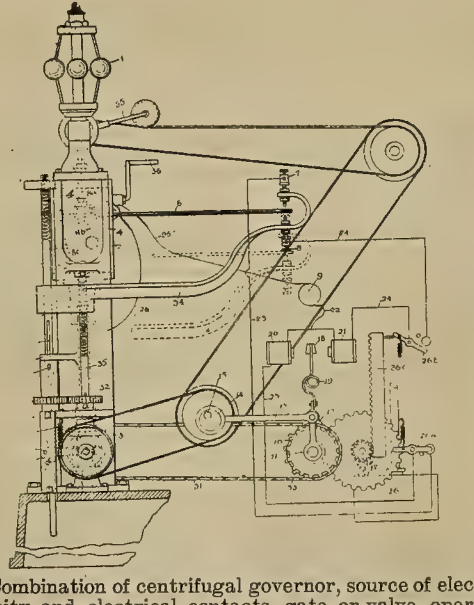
In pulverizing machine, combination with grinding bed, rotary actuating shaft, head on shaft provided with radiating ribs, each terminating in a pair of arms, shafts supported in arms, sleeves on shafts carrying inwardly and downwardly inclined spindle bearings and upwardly projecting lever arms, grinding rolls supported to extend over bed and journaled on spindles inclining downward toward shaft and confined at their inner ends in spindle bearings, hub on shaft, bolts secured to hub, passing through lever arms and secured by nuts, turning of which turns lever arms on their pivotal supports and thereby raises rolls bodily with relation to grinding bed, and springs confined between hub and lever arms.

PROCESS OF EXTRACTING SULPHUR FROM ORES.—No. 652,672; J. S. Fleming and H. Froehling, Richmond, Va.



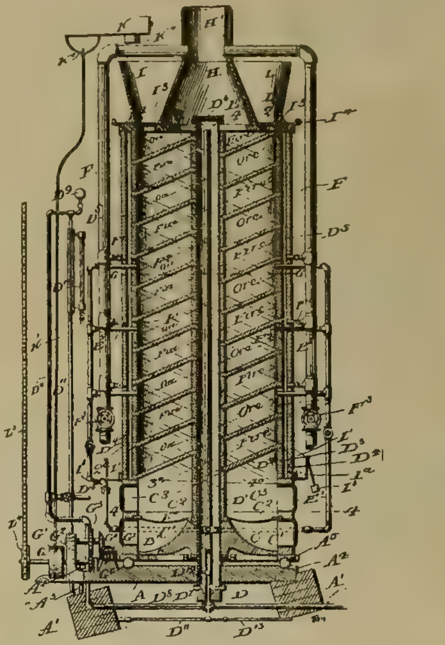
Process of obtaining sulphur from sulphur-bearing ores which consists of subjecting the ore to distillation in an atmosphere consisting of gas or gases which are not supporters of combustion, but with the admixture of a controlled quantity of oxygen.

WATER WHEEL GOVERNOR.—No. 652,389; W. W. Handy, Baltimore, Md.



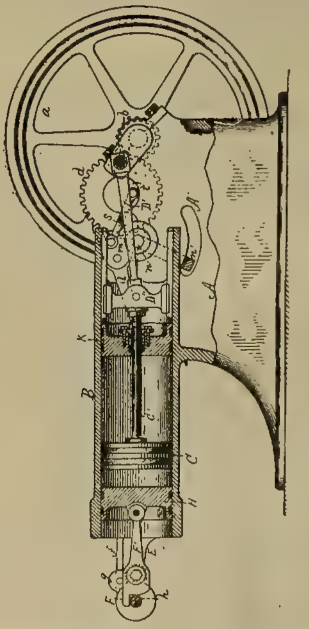
Combination of centrifugal governor, source of electricity and electrical contacts, gate or valve, operating mechanism connected with contacts, and lever operated by governor and normally held in state of balance between contacts, of means for moving lever, screw threaded shaft for operating contacts, pair of gears mounted on shaft, and means for revolving gears in opposite directions in such a manner as to move contacts through same distance as lever.

ORE ROASTING FURNACE.—No. 652,346; A. A. Chainey, Sanford, Me., assignor to H. H. Green, same place, A. D. Ross, Sunshine, Colo., and C. D. Bouton, Ithaca, and W. H. Marland, Binghamton, N. Y.



In an ore roasting furnace, combination of substantially vertical cylinder, driving ring supporting cylinder and provided with peripheral gear teeth, centrally disposed pipe extending upwardly through cylinder, clamping screws carried by hub of ring to engage pipe, driving mechanism engaging peripheral teeth of ring, parallel ore and fire flues within cylinder, feed and discharge means for ore, and heat producing means.

GAS ENGINE.—No. 652,382; J. H. Atterbury, Avon, Mass.



In a gas engine, combination with open ended cylinder B, main piston and piston rod in cylinder, pitmen and crank shaft and supplemental pistons H and K located within cylinder and between main piston and opposite ends of cylinder; of shaft h supported by cylinder, crank F fast on shaft, pitman F′ connecting crank and supplemental piston H, pitman being provided with arm F″ adapted to rest on shaft h when pitman F′ and crank F are in line, crank g on shaft h and mechanism connecting crank g and crank shaft; and mechanism intermediate with crank shaft and pistons H and K communicating movement relative to that of main piston to supplemental pistons alternately.

RETORT FOR TREATING ORES.—No. 652,332; B. Sadtler, Denver, Colo., assignor to A. G. Clark, Cincinnati, Ohio.

A retort for distillation of metallic ores, composed of an admixture of fireclay and infusible basic material in excess, such excess increasing toward inner surface, the whole fritted together.

The Electrical Precipitation of Gold on Amalgamated Copper Plates.*

NUMBER II.—CONCLUDED.

The existence in bath No. 1, containing the common salt, was somewhat lower than in the others, but the decomposition of cyanide was not reduced by the presence of the salt. The density of the current in this and all the other experiments was measured by a mirror galvanometer, with the aid of a resistance box and the fall of potential by a direct reading voltmeter. Both instruments were carefully tested.

When the current was turned on, a black film which proved to consist entirely of gold appeared almost instantaneously on the surface of the cathodes. The addition of sodium amalgam to the mercury baths caused the rapid absorption of the films of gold, but it appeared again almost instantaneously on the surface of the cathodes, and continued to grow thicker and thicker until it formed a black powdery layer which could not be amalgamated without the addition of sodium amalgam. It was easy to remove the whole of the film from the surface of the mercury and of the copper plate by means of a feather. About half the gold had been precipitated in this way when the experiment was stopped.

No. 2.—With the same baths and electrodes, but with the solutions kept at about 0.3% KCy and 10 ounces gold per ton, a current of 0.30 ampere per square foot of cathode was passed for 150 hours. The fall of potential in the baths was 0.75 volt. The black film on the cathodes appeared and thickened in the same way as in the previous experiment, but at the end of the week it was found that the deposited gold was distributed as follows, in grams:

	Bath No 1.	Bath No. 2.	Bath No. 3.
	Mercury cathode. Carbon anode.	Mercury cathode. Iron anode.	Amalgamated copper cathode. Carbon anode.
	Gram.	Gram.	Gram.
Black film on surface	0.681	0.472	0.686
In the mercury	0.583	0.451	.....
In form of amalgam adhering to the surface of the copper plate	0.180	0.324	0.603
Totals	1.444	1.247	1.289

The amalgam on the plates was somewhat hard and dry, but adhered well. It appears that under the conditions about half the deposited gold is amalgamated, and that part of this passes or is driven by the current through the mercury and adheres to the surface of the plate.

No. 3.—A current of 0.15 ampere per square foot was passed for ninety-two hours through solutions containing 0.2% KCy, using the same vessels and electrodes as before. Quantities of black non-adherent gold was precipitated as before, but the proportion between the amounts in this form and that amalgamated was not estimated.

No. 4.—In this experiment an amalgamated copper plate, forming the cathode, was suspended in a vertical position in 1700 c.c. of a solution containing 0.04% KCy and seven ounces gold per ton. A current of 0.04 amperes per square foot of cathode was passed for twelve hours. A black powder formed slowly on the cathode, and at the end of the experiment was swept off and yielded 4.5 m.m.g. of gold. The amalgam scraped from the plate yielded 144 m.m.g., and 201 m.m.g. of gold remained in solution. About 3% of the precipitated gold was, therefore, deposited as a non-adherent powder.

No. 5.—Continuing in the same direction, 1500 c.c. of a solution of 0.05% KCy and 9.25 ounces gold per ton was subjected to the action of a current of 0.02 ampere per square foot of cathode for nineteen hours under conditions similar to those maintained in No. 4. The black powder again appeared on the cathode, was removed by a feather, and proved to contain 2.5 m.m.g. of gold. Owing to an accident, gold in the amalgam was not estimated, though present in considerable quantities.

No. 6.—A similar result was obtained, using a round bath of mercury $11\frac{3}{4}$ inches in diameter as cathode. The current used was 0.027 ampere per square foot, and the fall of potential 0.75 volt, the anode being a small plate of pure gold. The weight of black scum collected after forty-eight hours' run was here only 1.6 m.m.g., and the amount deposited and amalgamated 718.6 m.m.g., or 99.78% of the total weight thrown down by the current. The solution contained 0.14% KCy and 3% of common salt.

No. 7.—Finally a current of 0.01 ampere per square foot was tried with arrangements similar to those in experiments Nos. 4 and 5. The fall of potential was about 0.7 volt. The solution contained 0.082% KCy and twenty ounces of gold per ton. After a run of twenty-four hours no change could be detected in the appearance of the cathode plate, no black film having made its appearance, but 93 m.m.g. of gold were recovered from the amalgam formed on the plate, an amount equal to 70% of the theoretical quantity which the current was capable of depositing. In some further experiments with 0.004 and 0.005 ampere per square foot and very dilute solutions of cyanide and gold, the cathode in every case remained clean and unchanged in appearance.

It is clear from the results given above that, when mercury or amalgamated copper plates are used as cathodes in the electrolysis of gold cyanide solutions, satisfactory precipitation can only be obtained when a low current density is employed. With 0.01 ampere or less per square foot of cathode gold is precipitated and amalgamated simultaneously, the plates keeping in good condition during twenty-four hours' use, while $\frac{1}{2}$ ounce of gold per square yard of plate was deposited on them. With currents of greater density, part of the gold is deposited as a non-adherent black powder, easily rubbed off, but not easily detachable by a jet of water, and not easily amalgamated. As the density of the current is increased, the percentage of non-amalgamable gold thrown down rises, until at 0.30 ampere per square foot about half the precipitated gold is not amalgamated. It, therefore, appears that one essential condition in the use of amalgamated plates as cathodes has never been clearly laid down.

In all the above experiments the condition of the precipitated gold was alone in question, no attempt being made to recover all the gold from the solutions. Moreover, any gold driven into the interior of the plates by the current was allowed to escape observation, but the experiments show that most of the deposited gold was recovered, and, therefore, that the amount could not have been so large as to preclude the use of such plates. The question now arose whether precipitation on copper plates could be effected conveniently and completely, and the following experiments were devised to test this:

No. 8—Three baths, each containing 1750 c.c. of solution, were used, the first being fitted with amalgamated copper electrodes; the second having iron anodes and lead cathodes; the third being without current or electrodes. The solution contained 0.0165% KCy and 0.0288 gram of gold per liter, or about $18\frac{1}{2}$ dwts. per ton. The area of the cathodes was 40 square inches, or about 162 square feet per ton of liquid. A current of 0.0012 ampere was used, equivalent to 0.005 ampere per square foot. After passing the current for eighteen hours the condition of the electrodes was as follows: Copper cathode, clean; copper anode, dark colored; lead cathode, coated with gold; iron anode, much oxidized, but showing no Prussian blue. The solutions were examined and found to contain the following quantities of cyanide and gold:

(1) Copper cathode....0.0015% KCy, 0.0100 gram gold per liter (or $6\frac{1}{2}$ dwts. per ton).
(2) Lead cathode......0.0025% KCy, 0.0215 gram gold per liter.
(3) No electrode.......0.0025% KCy, 0.0288 gram gold per liter.

About 60% of the current had been usefully employed in bath No. 1 in depositing gold, and 23% of the current in No. 2. Very little circulation of the liquid was attempted, but the baths were stirred occasionally. There had been no perceptible decomposition of cyanide due to the passage of the current.

No. 9.—Three baths were used, each containing 700 c.c. of a solution of 0.0025% KCy and 0.0360 gram gold per liter, or 1 ounce 3 dwts. per ton. The same electrodes were used, giving 400 square feet of cathode per ton of liquid, and a current of 0.0035 ampere per square foot was passed for $23\frac{1}{2}$ hours, with occasional stirring. After this the appearance of the electrodes was the same as in the last experiment, and the solutions contained—

(1) Copper cathode...No KCy, 0.0075 gram gold per liter (or 5 dwts. per ton.)
(2) Lead cathode.....0.0010% KCy, 0.0090 gram gold per liter (or nearly 6 dwts. per ton.)
(3) No electrodes.....0.0010% KCy, 0.0360 gram gold per liter.

The amount of current usefully employed in precipitating gold was thus about 36% in bath No. 1, and 34% in bath No. 2. The fall of potential in the baths was 0.22 volt at the start, and 0.6 volt at the end of the experiment.

No. 10.—In this experiment the gold was more completely precipitated. The same baths and electrodes were used, the solutions containing 0.03% KCy and 0.100 gram gold per liter, or 3 ounces $4\frac{1}{2}$ dwts. per ton. After passing a current of 0.005 ampere per square foot for 4 days 16 hours, the gold in each bath amounted to about 0.001 gram gold per liter, or 16 grains per ton. The amount of gold left in solution was tried each day by the purple of Cassius' test. No available cyanide was left in either bath at the end of the experiment.

In another experiment in which a current was passed through a rich solution for 14 days, 0.828 gram gold was deposited from solution, and 0.550 gram, or 66.4% of the total amount precipitated, was recovered from the amalgam scraped off the plate. It is clear from these results that the decomposition of cyanide is created when amalgamated copper electrodes are used than if lead and iron plates are substituted for them. On the other hand, more gold appears to be deposited on copper than on lead, especially when rich solutions are being treated. It seemed certain that both these effects were due to the chemical action of copper on the solution, working in conjunction with the current. In order to determine whether the whole of this effect came from the anode, or if part was attributable to the cathode, a small current was passed through a solution of 0.06% KCy, using sheet lead anodes and an amalgamated copper cathode. After 24 hours it was found that copper could be detected in the solution. The weight of the amalgamated copper cathode was—

Before using	149.953 grams.
After using	149.881 grams.
Loss by dissolution	.072 grams.

The current had therefore been unable to protect the cathode from attack by the solutions.

The conclusions to be drawn from the experiments do not appear to lend any countenance to the view that mercury or amalgamated copper plates will ever be satisfactory substances to use as cathodes in the electrolysis of cyanide solutions. A current must be of small density in order to deposit gold on mercury in a form in which it can be easily recovered. Consequently, as Von Gernet said, the high cost of mercury prohibits its use. On the other hand, with amalgamated copper plates, the density of the currents must be apparently even smaller, not exceeding say 0.015 ampere per square foot, in order that the gold may be deposited and retained, and the dimensions of the cathodes must, therefore, be even greater than if mercury is used. Apart from the cost of the plates, however, the cyanide solution suffers loss by dissolving copper from the cathode, and against all these disadvantages there appears to be no real advantage to be gained by using them instead of the customary lead cathodes.

---

*A paper read by T. K. Rose before a recent meeting of the Institution of Mining and Metallurgy.

Ozokerite.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

There are only two ozokerite mines of any magnitude in the world, though claims of recent discoveries in different parts of the United States have been made from time to time. These are the Galician mines, the oldest works of that kind known, which are controlled in greater part by a Russian syndicate and to a smaller extent by French capitalists; and the Utah deposits, which are in the hands of American concerns.

The mineral has also been located in Moldavia, a northern province of Roumania, in the vicinity of coal and rock salt, and at Gresten, near Gaming, in Austria, while it occurs besides at the Urpeth colliery, near Newcastle-on-Tyne, Northumberland, England.

The Galician deposit is found chiefly in the Miocene formation, a term applied to the middle division of the Tertiary strata of the mammalian age. The veins in which it is encountered have been traced on the surface for a distance of 132 to 270 feet, and measure about $3\frac{1}{2}$ feet in diameter. They pass downward through beds of sand, from 26 to 33 feet in depth, containing large siliceous rocks, and enter gradually a blue clay, from which naphtha generally oozes, when they finally disappear in a layer of plastic loam. The center of the basin is richest in ozokerite, and in some cases soft masses of such extent have been tapped that the miners had hardly time to escape before the workings were filled with the plastic material. Such a deposit was encountered in 1893 in the deepest shaft at Boryslaw, Galicia, at a depth of 681 feet. In general, however, the yield of wax varies from 2% to 8% of the mineral extracted.

Originally ozokerite was discovered in Galicia by a prospector searching for petroleum, with which much of the ground is saturated, and was regarded for a long time as an unwelcome associate to the oil, since it frequently caused the timbering of the shafts to collapse. It was only about twenty years after its discovery in Moldavia that ozokerite began to attain commercial importance, as a method was then discovered for producing a substance from it known under the name of "cerasin."

Previous to 1865 this ozokerite deposit had been regarded as a Crown mineral, a term implying that the Austrian government had the exclusive right of mining and disposing of the product. But when it was declared free in that year, a number of shafts were sunk in the district, and much speculation ensued. The land being parcelled out in small plots, numerous shafts of small section, mostly 3x4 feet, were sunk in the immediate neighborhood of one another, so that the mining of the mineral became a difficult and expensive operation, and much of the material was wasted.

The geological formation of the Galician deposit, shortly indicated before, is characterized by the presence of clay, salt and sandstone, which in connection with the occurrence of petroleum, represent the ideal conditions under which the existence of ozokerite becomes probable. Broken rock strata and saddle formations are considered furthermore as indications favorable to the presence of the mineral, judging largely from the character of the two localities in which ozokerite deposits of any magnitude have been found.

One of the main Utah deposits is situated between

Pleasant Valley Junction and Soldiers' Summit, a mile and a half from the Rio Grande Western, while another lies within a distance of about 5 miles west of this, and has been abandoned as a non-paying venture. The vein matter of the first named mine is between 3 and 4 feet wide, contains occasional pockets or kidneys, and shows a network of small veins permeating the fissures. The upper stratum consists of blue limestone of varying thickness, which overtops a sandstone formation of unknown depth, the latter cropping out at the surface in places. The ozokerite veins permeating this sandstone layer have been worked down to about 150 feet, and are expected to reach a depth of at least five times that distance. The mineral products obtained from this deposit are classified as vein matter and shale, respectively, samples of which were analyzed recently in the laboratory of Field & Goody, Denver, Colorado, with the following results:

VEIN MATTER.

Paraffine	47.05	74.94
Paraffine oil	27.89	
Carbonaceous residue	14.22	
Mineral residue	0.79	
Volatile organic matter	9.75	
Water	0.15	
	99.85	

SHALE.

Paraffine	22.17	22.32
Paraffine oil	0.15	
Carbonaceous residue	9.74	
Mineral residue	62.02	
Volatile organic matter	5.34	
Water	0.58	
	100.00	

The mineral residue, which was very small in the vein matter, showed in each case the presence of lime in prevailing quantities, together with iron oxides and alumina.

The method employed in Utah for the extraction of the ozokerite from the gangue consists in treating the pay rock—holding in the special locality referred to up to 20% of values—in cylindrical tanks, 6 feet in diameter and 8 feet high, filled with water and heated by steam through an inside coil of iron pipe. This tank is provided with a water and oil gauge and a number of spigots, by means of which the liquid ozokerite is drawn off into rectangular pans, 10 feet long by 5 feet wide and 18 inches high—also heated by steam. Here the fluid mass is freed from mechanically enclosed water, which operation is accompanied by much rising and frothing of the substance, when it finally subsides and is conducted into circular molds so as to form, on solidifying, round cakes of 16 inches diameter, in which form it is brought on the market.

This treatment is based on the low melting point of ozokerite, which lies between 50° and 68° C., and its specific gravity, varying between 0.85 and 0.90, so that it separates gradually in a fluid condition from the gangue and floats to the top of the heated water. The subsequent operation of driving off the water was omitted in the beginning of the manufacture, toward 1893, so that Utah ozokerite, which, strange to say, was then known as Colorado ozokerite in England, obtained thereby a rather unenviable reputation.

When taken from the mine the mineral is usually of a yellow or light brown color, which gradually darkens, however, on exposure to the atmosphere. Simultaneously the wax hardens and becomes heavier—circumstances which are caused by the evaporation of volatile hydrocarbons always associated with the substance. For these reasons it seems fair to assume that the mineral originated from petroleum by the limited evaporation of the lighter hydrocarbons contained in it, and that the base of its formation was this oil. The latter presumably entered the fissures from below, and, being restrained by its enclosure from coming in contact with the air except at the surface, lost but a part of these volatile bodies, permeated the adjoining sand or lime formations to form bituminous shale, and left the heavy hydrocarbons behind as ozokerite. In other words, nature performed a task similar to the operation carried on in the fractional distillation of petroleum in retorts, but resorted in her punctilious ways to the preservation of all the values present by a tedious and gradual process at low temperatures and peculiar conditions.

It will be seen from the foregoing analyses that ozokerite is especially valuable on account of the paraffine wax and paraffine oil contained in it in considerable quantities. To produce these compounds advantageously the mineral should be subjected to destructive distillation in a retort, when a volatile gas and a burning oil come over first at 360° C., and, on raising the heat to about 500° C., a mixture of paraffine and paraffine oil results, which is readily condensed in the receiver. The heating ought to be done gradually and uniformly at a dull red heat, and no part of the retort should be allowed to become red hot during the operation. If these precautions are observed, the yield is most satisfactory, and the hard, waxy, carbonaceous residue remaining in the bottom of the retort will be found to be in the proper condition to be manufactured into "okonite." It is incorporated for this purpose with indiarubber, the plastic mixture passed through rollers at moderate temperature, and the plates resulting subjected to vulcanization. Having undergone these manipulations, the product represents a very valuable insulating material for electrical purposes and possesses, besides, a degree of toughness and flexibility which make it a very desirable substitute in cases where rubber alone would not answer.

The paraffine obtained in the manner indicated above serves partly, after proper refining described later on, for the manufacture of candles, and is considered a superior article, since candles made from the material are more compact than those prepared from petroleum paraffine, and, consequently, do not bend or gutter when lighted, like the ordinary article. It also finds application in the crude state for the manufacture of the finer grades of vaseline, when the solid and liquid paraffines produced by distillation are mixed in such proportions as to give a material of the required consistency. The common variety of vaseline, however, is prepared from petroleum residues, which are melted and passed through filters of fine, granular and thoroughly dried animal charcoal, when the resulting bleached and refined product represents the article of trade commonly known as vaseline.

In fact, there are hardly found in nature three raw materials more closely related than natural gas, liquid petroleum and ozokerite or mineral wax, and the United States excel in this regard most conspicuously, since all three are found frequently in association within its boundaries. This close relation renders the theory acceptable that ozokerite is to be classed with the olefines of the general formula $C_n H_{2n}$, and that it belongs to this group of simple hydrocarbons, having originated by a "polymeric" change from petroleum. This term comprises the principle according to which a diversity of compounds can exist under a common formula, their percentage composition being the same, while their molecular weights and actual number of atoms differ.

Analyses of the organic elements constituting ozokerite show it to be a compound of carbon and hydrogen in the proportion of 85.5 and 14.5, when pure. The natural product is, however, frequently contaminated with admixtures of asphaltum, earthy matter and water, so that these proportions vary to some extent, as becomes clear from the following analyses:

Ozokerite from—	Boryslaw.	Moldavia.	Urpeth.
Carbon	85.50	85.75	86.80
Hydrogen	14.50	15.15	14.06
	100.00	100.90	100.86

The European mineral has been found to be especially adapted for the manufacture of cerasin, while the American product, when properly treated, does not give any of the compound. This behavior is rather startling, but cannot be doubted, since several experimenters, and the writer himself, did not succeed in producing the substance desired from the Utah specimens, in spite of repeated efforts. This cerasin, which resembles beeswax in appearance and derives its name from the Latin "Cera," meaning wax, is prepared from the refined European ozokerite by judicious treatment with sulphuric acid, preferably fuming or Nordhausen acid, at a steady temperature of 80° C., when, after the addition of all the acid required for refining, the temperature is raised to from 180° to 190° C., so as to eliminate all the resinous admixtures present. After the removal of the latter, the temperature is lowered to 140° C., and the mineral wax remaining bleached by means of animal charcoal or the carbonaceous residue produced during the manufacture of yellow prussiate of potash.

As the American ozokerite cannot be applied at present to the manufacture of cerasin, no method having as yet been devised for that purpose, its utilization has been limited mostly to the production of paraffine, paraffine oil and okonite. Besides these uses it finds, however, application in the manufacture of varnishes, heavy lubricants, and blacking, serving furthermore as a welcome material for caulking ships, so that it commands a steady price in the Eastern market. It is quoted at present in New York at 8 cents per pound for the foreign article, and at 6 cents for the domestic product, transportation from Utah to the seaboard amounting to $27 per ton. Deducting mining and refining expenses, and cost of transportation, there remains sufficient margin to render the working of the deposits remunerative, and to encourage further prospecting for the mineral. These favorable conditions are still enhanced by the imminent exhaustion of the Boryslaw mines, already reported from time to time, so that finally the Utah deposit will represent the only source from which to supply the market, unless new discoveries are made in California, Utah or Colorado, for which indications are favorable.

Smelter Methods in Colorado.

To THE EDITOR:—Among the new wrinkles for 1900 which the smelter trust is working on the miner are; first, paying 2½ cents per unit below their own market quotation on Pb., or 52½ cents per unit instead of 55 cents on a $4 New York basis, as has been the rule for years; second, two-tenths of one per cent increase in the calculated difference between wet and dry assay on copper; third, a reduction of 3% on free limit on zinc; fourth, a reduction of 2% on free limit on sulphur. Let us take a class of ore not uncommon in Colorado and usually produced in small lots by shippers who must sell at the open market price: Pb. 20%, Cu. 8%, Zn. 15%, S. 20%; loss on Pb. per ton, 50c; loss on Cu. per ton, 40c; loss on Zn. per ton, additional to smelting charge, 90c; loss on S. per ton, additional to smelting charge, 50c. Total, $2.30.

Aspen, Colo., June 30.

At the Paris Exposition.

From Paris A. Van der Naillen of San Francisco writes that the mineral exhibit of the United States is finished and open to the public and greatly appreciated by the crowds before the cases filled with specimens from mining States.

He mentions, particularly, a large piece of crystallized gold of delicate leafy structure 12x8 inches, which crowns the pyramid, loaned by J. D. Fricot of San Andreas, Cal.

Mr. Van der Naillen says many of the leading mines of the mineral States have contributed beautiful specimens to the exhibition. Special exhibits of quicksilver ores, bitumen rock, asphaltum, mineral oils, borax and copper are also noticeable.

"A fine model of a 5-stamp mill in full operation, built by the Union Iron Works, attracts great attention at all times by the hammering of the stamps." A. Ekman of Oroville is in charge of the California collection.

In the metallurgical department the exhibit marked "From Quartz to Bullion" attracts attention. This interesting exhibit was donated by H. P. Stow of the Gold Bank mine of Butte Co., Cal.

"Next to the United States comes the mineral exhibit of Russia. In native gold it is far from being equal to ours; but in all other minerals it is on a parallel with ours. Its territory being so immense from which to gather specimens, in its great variety of riches of its iron ores it is superior to ours. They have mines of pure magnetite cropping in large ledges through the eternal snow of Lapland, and from there to Persia and India they have mineral deposits of all kinds.

"Italy has also an interesting mineral exhibit, the ores mostly coming from the foot of the Alps. The marbles are of course exceptionally beautiful.

"France and Germany are in the first ranks after the United States and Russia. Their exhibits of ores of the precious metals are ordinary, but those of coal, iron, zinc, antimony and manganese are wonderful.

"The great Exposition waxes more beautiful daily and in measure as the general sights have been realized and appreciated; in the same measure do we pay more attention to its details, and only then, when haste is over and we take due notice of every special exhibit, do we realize the beauty of the design, the finish of details, the genius developed in each structure—genius harmoniously blended with art."

The Work Would Apply.

To THE EDITOR.—Can work done running tunnel in patented ground toward and to develop a location made in 1899 apply on assessment work on such location if owned by same company? The development work would not be of any value to the location if done in any other way. L. W. M.

San Francisco, June 28.

Where work performed or improvements made manifestly tend to the development of a mining claim and made in good faith, it would be difficult to successfully combat the case by any adverse claimant.

In the specific case mentioned the answer is "Yes." Work done outside of a claim, if for the purpose of developing that particular claim, and if such fact can be clearly shown, is as available for holding the claim as though it had been done within the boundaries of the claim so developed.

An Act of Congress passed February 24, 1875, amends section 2324 of the United States Revised Statutes as follows: "So that where a person or company has, or may run, a tunnel for the purpose of developing a lode or lodes owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes," etc.

A TRAVELER in El Paso, Tex., might be occasioned some trouble if he should desire to set his watch there. Mountain time is used locally and by the Santa Fe; central time by the Southern Pacific's Atlantic system and the Texas Pacific. Pacific time is used by the Southern Pacific's Pacific system, and the Mexican Central Mexican time, which is twenty-four minutes later than Mountain time. The Southern Pacific makes a jump of two hours, the only point where a change of more than one hour occurs. If one travels via the Sunset route from San Francisco to Jacksonville or Savannah on the Atlantic he will only have to change his watch once, at El Paso, where Pacific time is advanced two hours to Central time. There is only a difference of two hours between San Francisco and Savannah.

MINING SUMMARY.

ALASKA.

The steamship San Blas, which left Cape Nome June 21, reports that there were forty-two vessels in Nome harbor that day. The beach was piled high for several miles with freight of all descriptions. The sea was covered continually with myriads of barges and lighters transferring freight from the vessels to the shore. Hundreds of row boats and launches were continually passing from the boats to the beach.

Nome beach gold is worth more than Dawson gold. It assays $18.25 per ounce.

Purser Hayward says the beach claims have been worked over three or four times. He is of the opinion that the creeks near Nome are rich. He thinks the population of Nome may reach 50,000 before the rush subsides.

Under date of June 3, J. B. Zimdars writes to the Dispatch from Cape Nome: "Unless you can afford to blot out a year of your existence and lose the cost of living for a like period, or you can afford to drop a thousand or more for the sake of experience, stay at home. Under no circumstances come if you must stake your all. It is true there is an extensive gold belt here, reaching from Norton bay to the Arctic. But the creeks in that belt which contain pay are comparatively few and far between. The beach, which is the hope of thousands who, we are informed, are coming, has been more than three-fifths exhausted by last summer's work, as far as individual mining is concerned. Some few rich spots may yet be found, but the average beach miner will be paid with results which will represent only average wages. To him who cherishes the idea of finding new creeks and becoming the owner of yet undiscovered claims, I can but say that virtually all that most of the people here have so far done is to stake and locate claims; and if there be any creek, or gulch or bench yet left unstaked it is a pure accident, for which the stampeder would blush for shame should it ever be brought to his knowledge. For men to find claims at this late day they must be prepared to lend themselves to a year of hard tramping and more wearing work than most of them have been accustomed to, with the chances ten to one against them. And to augment all those difficulties there are still others to be considered—the cost of getting here, for passage and freight; the almost entire absence of food and shelter; the shortness of the working season, virtually only four months. During the eight months of winter none but deep diggings and tundra claims can be worked to any advantage, and as far as other mining is concerned, this period can only be devoted to preparation for the next season's run."

The Alaska Commercial Co.'s steamer Portland from Cape Nome brought passengers and gold. The captain reports a general and continuous row along the beach at Cape Nome between conflicting claim owners and their agents. There is the usual report of considerable gold being taken out at Topkuk, and the papers have alluring pictures of men with their pants tucked in their boots, carrying big bags, presumably full of gold. It is estimated that there are 30,000 people at Cape Nome. The lawyers are all busy.

The exodus to Cape Nome from Dawson, which has been comparatively steady, had been superseded by the rush to the Kyuoquot country.

The Cape Nome Gold Digger of June 13th says: "There is not a man on the beach line but knows he should be pitched incontinently, neck and heels, from his roosting place. Each and all of the men there have been expecting to be thrown off and are wondering why they are not. The value of tens of thousands of dollars worth of property is involved, and the highways and landings are obstructed. There should be no temporizing with the question."

ARIZONA.

GILA COUNTY.

Silver Belt: Mgr. Cutting of the Troy mine is going to push work, commencing soon. The company is said to have $20,000 on deposit in Globe for development work.

The Ray mill, at Kelvin, will be in operation Sept. 1. The ore train is making regular trips from the mine; there is now on the dump at the mill a pile of ore 500 feet in length, 30 feet wide and 17 feet high. The dump is on the upper side of the mill and above the crushing floor. The train runs up onto the dump and discharges its cargo in a few minutes, the cars being self-dumpers. From this dump the ore is dropped through trapdoors to the self-feeders over the Cornish rolls, which are arranged in series, so that the product from the first, or coarse-crushing rolls, passes, automatically, to the next set of rolls, which reduce the product to a [illegible] greater degree of fineness and passes it on the next set of rolls; thus the commutation continues until the last set or finishing rolls have been reached. Here the product is caught by elevators and carried to the top of the building, where it is discharged, automatically, into revolving screens, of which there are three sets, running in mesh from ½-inch down to ¼-inch. These classify the pulp into uniform sizes, and each size is discharged, automatically, through a chute to a double-compartment, iron plunger jig, of which there are twelve in the mill. These jigs take out the coarse metal and also the finer particles which have been freed from the gangue in passing through the rolls, and make clean concentrates both above and under the screen beds. The tailings from the jigs pass to two Chilean mills of 80-ton capacity each, where they are recrushed to pass through about a 40-mesh screen and discharged onto sixteen Hallet concentrating tables. The middlings from these tables are pumped into an iron cylinder, the dimensions of which are 4x12 feet. The interior of this tube is partially filled with Norway round flint pebbles, ranging in size from 1 inch to 3 inches in diameter. The cylinder revolves and the middlings are reduced by attrition till the pulp will pass a 60-mesh screen, through which it is discharged and returned to the tables, where it receives final treatment. The plant will handle 250 tons of ore in twenty-four hours; seven tons will be concentrated into one; the output of concentrates every twenty-four hours will be about thirty-five tons. The average grade of the ore being a little over 4%, the concentrates will carry about 30% copper, beside iron and other values. At 16 cents for copper, the concentrates will be worth $96 per ton for their copper contents. The mill will require the services of eleven men to operate it. The company intend to increase the capacity of the mill to 800 tons per mill day of twenty-four hours, if the present plant handles the ore successfully. The first improvement made will be a railroad from Kelvin to the S. P. or to a connection with the Santa Fe at Phœnix.

GRAHAM COUNTY.

On June 29 the reduction works of the Detroit Copper Co., at Morenci, caught fire and the entire plant was consumed. The fire was caused by the bursting of a slag pot. There were no water facilities. The works consisted of a 150-ton concentrator, smelter furnaces and converters. The company has a 600-ton concentrator mill one mile distant from the old plant.

MOJAVE COUNTY.

Mineral Wealth considers the strike on the Juno at a depth of 400 feet important for the district. The property was a rich producer until the development reached a break in the vein that contained mineral country rock, mud, etc., when it became too low grade to ship. The present owners have been sinking to get through this mixed zone and have succeeded. Breaks occur in nearly all the mines of the county and usually work has stopped at the break line. The Juno is the first mine in the county to get below the break line and the renewal of the ore is important.

North of Chloride J. C. Stewart has located what he considers to be a turquoise mine, worked in former days by the Aztecs.

Near Chloride, Mgr. Wulstein is sinking on the Silver Age mine 3 feet a day.

The Juno mine shaft is down 400 feet, and at the Blue Pea, Mgr. Rochford will put in a steam hoist.

The Lucky Boy has "mahogany" ore, it being of a dark brown color, closely resembling mahogany wood.

YAVAPAI COUNTY.

The officers of the Crowned King M. Co. are: N. C. Shekels, president and general manager; R. Wilkinson, vice-president; J. M. Taylor, secretary; B. A. Turner, assistant secretary; G. P. Harrington, treasurer; P. A. Jones, Supt.; R. H. Hetherington, residing agent at Prescott.

J. H. Wilkerson has bought the Sun Dance mine, near the head of the Hassayampa, at trustee's sale, and will work it.

Contracts have been let for 200 feet of drifts and an upraise of 165 in the Mammoth mine, Big Bug.

A cyanide plant for the working of gold ore that does not smelt well will be built by the Copper Chief Co. at their mine, 7 miles south of Jerome.

YUMA COUNTY.

F. M. Barnes of Poncho Springs, Colo., and F. B. Cassiter, at Needles, have acquired 4240 acres of dredge and hydraulic placer ground above The Needles.

CALIFORNIA.

AMADOR COUNTY.

Ledger: In the Centennial, at Drytown, Supt. Gross has samples of ore from the 630 level that, he says, will assay $107 per ton, and other levels that will go $60.——Supt. Stewart of the Butte Basin Gravel Co. has gravel in the long tunnel that will average $4 per ton.——At Amador work is under contemplation at the Fremont and Gover mines. The new shaft at the Fremont is down over 300 feet. The old Gover shaft will be unwatered and retimbered, and equidistant from the two shafts, which are 1200 feet apart, a 60-stamp mill will be built.——In the Amador Queen No. 1, at Jackson, Supt. Dye is fitting up additional stamps and concentrators and at the 500 level is making preparations for stoping. The ore yields 6% in sulphurets.

CALAVERAS COUNTY.

Near San Andreas the Commodore has men repairing and straightening the shaft preparatory to further sinking.

The Del Monte M. & M. Co., a new incorporation, will work in Railroad Flat mining district the Del Monte, or Old Prussian Hill mine, the Monte Del, Hazard, Calaveras View, Pina Vita and the west extension of the Del Monte.

At the Oriole mine, near Angels, crosscutting is being done at the 400-foot level. The Citizen says the ore body is nearly 20 feet thick, and all good milling rock.

The Ford will be unwatered to the 400 level.

Supt. Carver of the Table Mountain cement gravel mine, between El Dorado and Sheep Ranch, has a 5-stamp mill crushing thirty tons daily; five stamps more will probably be added.

The Riter mine, near El Dorado, has incorporated in San Andreas; capital stock, $100,000; M. C. Rigney, C. D. Fontana, S. E. Redmond, E. Casey, F. J. Solinsky.

At Angels a mining company has been formed to dredge the Mokelumne river near Jackson bridge. The company is the Angels Submarine M. Co.; W. A. Clark and T. Colepan are managers.

EL DORADO COUNTY.

(Special Correspondence).—The South-Sliger mine, 3 miles north of Greenwood, is being developed by a San Francisco company. The main incline is 300 feet deep. At 260 feet a crosscut was made to the hanging wall a distance of 100 feet—all in vein matter. In the crosscut, 50 feet east of the incline, a streak of ore 1 foot wide was found showing ore rated at $40 per ton. In bottom of the incline the pay ore is 10 feet wide. Sinking is progressing. C. W. Keeney is Supt.

The Union mine and 20-stamp mill is sold to the Schoolgirl M. Co. T. H. Williams, Jr., D. M. Burns and D. Bixler paid $12,500, or a quarter interest in the Union mine for 25,000 shares of the Schoolgirl; the U. G. M. Co. receives 75,000 shares in the Schoolgirl as a compensation for an undivided three-fourths interest in its mining ground and mill, Mud Springs district.

At the Big Canyon mine work has suspended. Some of the machinery will be moved to Tuolumne county. The Vandalia mine continues.

J. H. L. Tuck is opening the Expansion mine, west of Placerville, and grading for a mill.

Placerville Nugget: The mill at the Omo mine has started up.——Two shifts are employed in the Mt. Hope mine, near Grizzly Flat.——At the Larkin mine, Diamond district, ore is being stoped from the 600-foot level sufficient to run the 10-stamp mill.——The Mt. Pleasant mine, near Grizzly Flat, is unwatered to the 500-foot level.——At the Grand Victory mine thirty men are employed.

Nugget: The tunnel at the Electric mine is in 680 feet.——At the Alpine mine crews are working night and day sinking a shaft.——At the Big Canyon mine work stops July 15.——At the Little Gem mine near Volcanoville ten men are crosscutting.——At the Expansion mine, 8 miles south of Placerville, a mill site is being graded.——Davis Brothers have bonded a quartz mine, 1 mile southwest of El Dorado, and will put in a steam hoist and pump.

HUMBOLDT COUNTY.

W. McCracken of San Francisco will develop the copper claims at the head of Mad river, 60 miles southwest of Weaverville.

INYO COUNTY.

At Darwin the Defiance mine suspended operations for the present, Supt. McDonald being unable to get miners enough to work the mine with a full crew.

A payment of $10,000 has been made on the recent purchases in Inyo county by the California & Inyo M. Co. of Salt Lake City, Utah. F. Mathews, the manager, has gone to the property with H. E. Simmons. The vein is reported to be 5 feet in width and assays 30% lead and 40 ounces silver per ton.

KERN COUNTY.

The S. P. Co. will build a 35,000-barrel tank at the track in the Kern river fields, to be used as a reservoir for locomotive fuel.

At Bakersfield the Hercules Oil Co. will build an oil refinery, capacity 1000 barrels daily.

The Californian hears that the security of those whose titles rest on mineral locations may be only fancied. The "scrippers" have been maintaining a regular bureau of information at Washington and have left no work undone which would strengthen their side of the case, while the mineral locators, regardless of warnings, have done practically nothing. The fate of the lands depends upon the attitude of the Land Department, of which the Secretary of the Interior is the head, and his position is thought to be indicated by the stand he took in relation to the petroleum miners' bill, which failed of passage because of his opposition.

The Kern Oil Co. has sold to Collins & Waterman the west half of the southwest quarter of section 4, 29–28, for $120,000, or $1500 an acre. The Aztec Oil Co. has eighty acres in the same section, paying $108,000.

MADERA COUNTY.

(Special Correspondence).—The Magnet Co. is grading for a new stamp mill, 850-pound stamps, quick drop. The mill is at the foot of Crystal Falls, will be run by water power; steam will be used until the dam is completed at the head of the falls, and the winter rains fill the reservoir. The Lily mill has completed a run on ore which is said to have yielded very satisfactorily.

Gold, June 29.

MARIPOSA COUNTY.

(Special Correspondence).—In the Merced G. M. Co.'s operations the recent find of quartz cutting diagonally across the mother lode continues strong, besides considerable trenching on the surface. A shaft being sunk on this vein is now down 60 feet. At the Mary Harrison mine the main vertical shaft is down to the 800 level, a crosscut has been made to the vein and an inclined shaft (to conform to the dip of it) is being sunk some 40 feet back in the footwall slates. The winze from the 700 level is down to the 900, and a drift is being run north to connect with the shaft.

Coulterville, June 27.

At Mariposa, Supt. J. L. Madden of the Francis mine will put a 10-stamp mill and 40-ton cyanide plant in operation by November 1. The ore averages 8% in sulphurets. The shaft is down 300 feet.

A contract has been let by the Mariposa C. & M. Co. to Corbett & Koglund to run the east and west drifts in the Mariposa mine at the 475-foot level. The contract calls for each drift to be run 200 feet, the contractors being required to break the ground, the company furnishing everything and removing the dirt.

MENDOCINO COUNTY.

C. R. Schumacher of Colorado has a bond on the manganese mine near Ukiah.

MONO COUNTY.

At Lundy R. T. Pierce is digging a ditch for the pipe line to convey power to drive the 300 H. P. electric motor on Mill creek.

W. C. Travis is daily treating 100 tons of tailings at the Jackson & Lakeview cyanide plant, Lake canyon.

NEVADA COUNTY.

The machinery transferred from the Daisy Hill to the Jeffersonian mine, near Grass Valley, is running.

H. L. Body will build a 20-stamp mill at the Cadmus mine, near Nevada City.

PLACER COUNTY.

Colfax Sentinel: Supt. Felix Chappellet Jr. of the Eureka mine is extending the main tunnel.——The tunnel of the Azalea mine, Blue canyon, is in 2640 feet.

The Gold Run Gravel Co., also the Inskip Co., have closed down; failure of water supply. The Inskip Co. has shown that the bedrock is pitching into the hill. The company will extend the main tunnel 300 feet to reach gravel at the bottom of the channel.

PLUMAS COUNTY.

To the Arcadian property, near Greenville, a 10-stamp quartz mill will be removed from the Gullic mine.

At Rich Bar the Moore property will resume next week in charge of T. R. Andrews.

Carter & Deal, at Crescent, have twenty pounds of gold taken from their placer claim, the Cadimus, worked by the ground-sluice method.

Morgan & Mott have bonded the Hughes property at Meadow valley.

SAN BERNARDINO COUNTY.

The new mill on Capt. DeLamar's gold mine at Gold mountain will start up August 1st.

The Alameda Borax Works are closed because of a raise in freight charges on the crude borax from Death valley to the works, the Southern Pacific Co. raising the rate from $6.50 to $29 a ton. The refining will be done in New York, the rate from the mines to that point being cheaper than it is to San Francisco. The borax works have been receiving about 900 tons of crude borax from Death valley each month. A raise of $22.50 a ton in freight from one California point to another is prohibitive.

SAN DIEGO COUNTY.

I. Trumbo's report as receiver of the Golden Cross mines at Hedges shows that a total of $18,888.02 has been received from the mines since March 31, and $21,443.43 expended.

SHASTA COUNTY.

The Black Spider mine, near Keswick, has closed down.

The Searchlight says that by November 1st smoke will be issuing from the stacks of the Bully Hill smelter. The stack of the roasters will be 125 feet high, of the smelter 100 feet and of the converter 90 feet. Seventy men are employed at mine and smelter site.

Shasta Democrat: Machinery is to be put on at the Mt. Shasta mine; sinking the main working shaft, now down 350 feet, is being pushed.

The Pioneer G., S. & C. Co. has incorporated at Redding; H. C. McClure, O. E. Nash, T. Greene, J. R. Hall, A. Bell; capital stock, $200,000; to develop the Recorder and Town Creek mines at Copper City.

The National mine in Rich gulch has temporarily closed down. S. P. Poland & Co. will continue cyaniding the tailings.

SISKIYOU COUNTY.

Spanglor Bros. have closed their mine at the mouth of Humbug, water being too light.

The Preston Peak copper district, in the Siskiyou mountains, is being developed by Schoonoven & Young of New York, represented by H. Phillips, who is locally credited with having spent $100,000. The work is a 200-foot drift right on the ledge and a 70-foot winze. They have ore which assays 22% copper and $4 in gold. Another property there is owned by E. M. Drexler and J. W. Pierson of San Francisco, represented by J. T. DeBoy. They have spent considerable money in development work. Their vein is 4 feet, runs parallel with the other property and assays the same.

TUOLUMNE COUNTY.

Supt. R. L. Long at the Tri-Color mine, Tuttletown, is sinking a three-compartment shaft. A new gallows frame has been completed.

The Rosedale gravel mine, east side of Table mountain, is leased to D. L. Quirolo & Co., Rawhide.

"Sinking in the shaft and doing prospect work" is the report of Supt. A. L. Moore of the Green mine, above Sugar Pine, to the Magnet. Twenty men are employed.

The Yosemite G. M. Co. have their pipe line completed on the line of Big Oak Flat ditch.

The incline shaft at the Jumper mine is down 1300 feet.

The Dutch M. & M. Co. has levied an assessment of 15 cents per share.

Concerning Santa Ysabel reorganization, Treasurer Belches says that holders of 125,000 shares have thus far assented to the plan, leaving a margin of 5000 shares unassented.

Supt. Pease of the Mazeppa mine reports the shaft 515 feet deep. In drifting, crosscutting and upraising 1134 feet of excavations have been made. At the 300-foot level the vein will mill an average of 12 feet wide. The 100-foot level is extended south 66 feet. On the 200-foot level a drift has been run south 285 feet on the vein. A crosscut was made west on this level, showing the ledge 20 feet wide; 215 feet south of the shaft an upraise is being made to connect with No. 1 level; 250 feet from the shaft a crosscut west shows the vein to be 20 feet wide. From the 200 station a drift has been run south 225 feet. At the 225-foot level an upraise is being made for ventilation and stoping. A station has been cut at the 400-foot level and a crosscut run east 202 feet, cutting two veins lying east of the one now worked. On the 500-foot level a drift is now in 107 feet.

The Mount Jefferson mine, Groveland, is to have a vertical three-compartment shaft to tap the vein at a depth below 600 feet. The Magnet says the mill is turning out about $7000 a month with ten stamps.

At Big Oak Flat ten stamps are to be added to the Nonpareil mill; a hoist is to be put in at the Nonpareil shaft of the Longfellow mine.

YUBA COUNTY.

The crushing plant in the Blue Point mine at Smartsville is a revolving screen cylinder, 6 feet diameter, 8 feet long, propelled by a turbine wheel, with an average speed of fourteen revolutions per minute. The bearings are hollow and 18 inches in diameter, through one of which the feeding is done; coarse matter passes through the other. Streams of water are conducted into and about the cylinder, which, with the fine or pay gravel, drops through the screen upon the table below and thence over a series of riffles.

COLORADO.

BOULDER COUNTY.

The Silver Lake mine, 8 miles west of Sunset, is to be worked. The ore is sulphide and carries gold, silver and copper. A prospectus places the average value of the ore at $32 per ton, and the cost of mining, shipping, milling, etc., at $14.50. The managers say: "We intend to make our money out of the mine, not by manipulating stock on the Denver exchange."

CHAFFEE COUNTY.

Granite mining district is the extreme northern end of the county, from the Arkansas river east to the Park county line; altitude, 8500 feet; geological structure the granite-gneiss complex common to that section of the State, the whole district traversed by porphyritic dykes varying from 100 to 600 feet in width. The ve[illegible]s of the district are of true fissure type, though small; principal value gold.

The Belle of Granite, at a depth of 250 feet, is still in the oxide, having passed through small bodies of sulphide of as great, or greater, value than the oxide.

The Magenta has a depth of 500 feet.

CLEAR CREEK COUNTY.

Idaho Springs Gazette: The management of the Lamartine mine will shut down the compressor to change the plant to electricity. Although they have a tunnel connecting the lower workings, they hoist all the mineral through the shaft where the machinery is located. In changing from steam to electricity there will be a saving of one-half the present cost of operation, not including the labor, the mine giving employment to 100 men.

The McKinnie–Davie Investment Co. has secured control of the Freeland mine and other contiguous property. A payment has been made and the deal involves the payment of $250,000.

CUSTER COUNTY.

The Grand Rapids G. M. Co. has organized to work a group 2 miles from the Bassick mine, comprising the Woodhull, Bobtail, Lily, Wellington, G. W. and Antrim claims.

DOLORES COUNTY.

Near Rico the Weaver–Burke lease on the Swansea G. & S. M. Co. employs fourteen miners; three carloads of gold-silver ore were shipped during June.

On June 24 the first shipment of zinc was made to Denver from the Atlantic Cable group of mines near Rico, operated by the New Jersey Zinc Co., for a crucial test.

FREMONT COUNTY.

At Canyon City the Lucky Day G. M. & M. Co., capital stock $1,000,000, has incorporated; C. Myers, W. L. Huffman, E. Colwell, W. J. Wilson.

GILPIN COUNTY.

Central City Register-Call: The Gettysburg M. & D. Co., operating the Gettysburg, Gilpin camp, have a 16-inch streak of peacock ore, which runs $50 per ton, with 10% copper.——Bertha G. M. & M. Co. are operating the head of Elkhorn gulch, M. W. Tanner, manager.——The Arizona property, bought by Boston parties for $60,000, lies part in Gilpin and part in Clear Creek counties, near the head of Gilson gulch. The main shaft workings are on the Gilpin county side. The new owners will sink the shaft to a depth of 500 feet.——The Specie Payment, on Bellevue mountain, is shipping enough milling ore to keep ten stamps dropping at the Black Hawk mills.——The Colorado & California S. M. & M. Co. have the 25-stamp mill at Idaho Springs and intend to make it a concentrator, with a daily capacity of fifty tons.

GUNNISON COUNTY.

The Times says there will be over 600 men on Redstone's pay roll next month.

A. E. Reynolds of Denver is locally credited with buying and locating properties in the lime belt near Pitkin, in Chicago Park, to the amount of 2000 acres.

HINSDALE COUNTY.

The Hidden Treasure at Lake City has been sold to New York men for $200,000. The property has been in litigation for several years.

A Lake City dispatch says: A. G. Morrison and J. Hockett were blown up beyond recognition this morning at the Hidden Treasure mine. They were alone and no one knows just how it happened. They stayed behind their companions, who went off duty at 2 o'clock, to fire their shots. They were not discovered until 7 o'clock this morning.

At Lake City Manager Gardner has the Ocean Wave concentrating mill completed. The Cammet table is to be used.

LA PLATA COUNTY.

The Bulldozer group of eleven claims in California mining district, Lewis gulch, La Plata mountains, is reported sold to E. K. Austin of New Yook and associates for $90,000.

LAKE COUNTY.

(Special Correspondence.)—The downtown mine of the Bohn M. Co., whose shaft is now about 500 feet deep, will sink 100 feet deeper to get under the carbonate and iron ore body known to exist at that level. The mine is now shipping about forty tons per day, but expects to increase this to 100 tons when prepared to hoist from the 600-foot level. This property and the California Gulch mine are under the management of J. W. Newell.

According to smelter receipts the tonnage of the district has slightly fallen off within the past week. This is accounted for by the lower lead prices, which had the effect of cutting off lead ores of low grade. The present advance in lead, however, is likely to result in restoring the former tonnage of low grades.

Leadville, July 1.

(Special Correspondence).—The California Gulch M. Co., of which J. W. Newell is manager, has just put in a new hoist over its 400-foot shaft and cut a pumping station at the bottom of the shaft. The station is 8x9x30 feet.

Leadville, July 1.

MONTEZUMA COUNTY.

At East Mancos, Supt. Haines of the Timberline Co. is milling thirteen tons ore per day. Supt. W. Rossler has the North Star mill running twelve hours a day.

OURAY COUNTY.

W. H. Hammond Jr. is pushing the Treasury tunnel, which is now in 1400 feet and progressing 8 feet per day.

In the Bobtail mine, Red Mountain district, owned by the Barstow M. & M. Co., twenty men, including top men and ore sorters. are taking out a ton a day per man. There is a streak of bismuth silver ore about 8 feet wide running through the vein.

SAGUACHE COUNTY.

Trouble is reported from Baca land grant No. 4, San Luis valley, near Duncan, where dynamite was used to blow up a mining settlement. Miners in the hills are arming themselves and propose to contest the rights of the company to evict them from their claims which the company claims comes to it by its purchase of the Baca land grant. A suit to evict miners and others from the grant is now pending in the United States court in Denver.

SAN JUAN COUNTY.

At Gladstone the South Dakota is shipping by car from the divide on the Ouray slope, at the head of Grey Copper gulch. The ore has a copper pyrite base, strong silver values and some gold.

The Queen Anne is spipping from Gladstone a lead base ore.

In Bear Creek district C. Weisbecker, lessee of the Gold Bug and Repeal mines, and C. P. Martin will put in a 100-ton cyanide plant.

G. H. Burrows has started a 6000-foot tunnel to tap the Broadway lode near the Hinsdale county line.

SUMMIT COUNTY.

(Special Correspondence).—Ault & Wiborg of Cincinnati, O., have very complete equipment at the Excelsior mine, including electric power plant and concentrating mill. The mine, which yields a sulphide ore, is opened through a system of tunnels. The electric generator is driven by water power.

Frisco, June 27.

(Special Correspondence).—The Summit M. & S. Co., in charge of Supt. E. E. Byron, is producing from 35 to 40 tons of ore per day, the most of which is concentrated at the company's mill. The ores are composed of an iron and copper sulphide, carrying small values in gold, silver, lead and copper. This production is the result of systematic development work in progress.

F. M. Linsley, manager of the Free American mine, reports the putting in of new hoisting machinery and that the property will doubtless begin shipping ore as soon as the machinery is ready to operate. He reports the vein 12 feet between walls so far as work has gone, and thinks the ore will stand shipment direct to the smelter.

The Snowbank mine, which shipped about twelve tons of ore per day from February 1 to May 20, found it necessary to cease producing a few weeks on account of the surfeit of water. The mine, having been unwatered, will resume work again July 1. The shaft sinks 100 feet to the blanket vein of sulphide ore, which carries lead, a high excess of iron, with fair gold and silver values. Supt. W. G. Martin thinks shipments will run about twenty tons per day from now on. The Snowbank belongs to James Stettauer of Denver.

The Sellers group, belonging to the Eagle M. Co. and managed by Peter Breen, ships steadily over 100 tons per day.

The Queen of the West, under lease to Turner & Farnham, is expected to begin shipments next month. The former lessees made a shipment of four carloads of ore which ran unusually high in gold and silver values.

The Iron Mask, now in control of Mrs. Marshall of Leadville, will be unwatered and mining work therein will be resumed.

The Eldora, near Robinson, under lease to Mr. Wright of Aspen, is reported making good shipments. Last winter an ore shoot heretofore undiscovered was opened, which has been yielding a rich grade of ore.

WASCOTT.

Kokomo, June 28.

R. J. A. Widmar and R. G. Dill, newspaper men of Breckenridge, have got out a folder containing a fine description of the Blue River gold fields, supplemented by colored maps of that section by F. C. Cramer.

The double Evans hydraulic plant of the North American G. D. Co., opening a pit to bedrock in the Swan valley, is within a few feet of the bedrock. The pit is about 40 feet deep.

TELLER COUNTY.

The Gould M. & M. Co. has made final payment of $20,800 on the purchase price of the two Sitting Bull claims recently bought for $67,500.

For the week ending June 21 Stratton's Independence shipped 1435 tons of ore; gross value, $104,700.

The Cripple Creek gold yield for June is figured at 49,350 tons; gross value $2,125,000. The mills treated 34,350 tons, saving $1,050,000; the smelters received 15,000 tons, average value $70.

The Standard M. & L. Co. has sold the Door Key G. M. Co. its interest in the McCumber, Morning Star and Door Key lode claims, on Tenderfoot hill, and the Malta claim for $50,000.

On June 30 the shafthouse of the New England G. M. Co., on the top of Straub mountain, was destroyed by fire.

The Cripple Creek sampler is to be enlarged 200 tons a day, the enlargement to be a duplicate of the present works. The new sampler to be erected by the same firm will be in the vicinity of Goldfield. The Cripple Creek sampler of the Rio Grande Sampling Co. is to be closed temporarily.

By a reorganization of the El Reno company through C. N. Miller, the new company takes over the El Reno, Comstock and the World's Fair lodes by payment of $50,000 cash and an interest in the new company by the old stockholders.

The Denver Post is authority for the statement that C. M. McNeill, S. Penrose and C. L. Tutt "are preparing to build a new and probably the largest sampler in the State on the railway track somewhere on the east slope of Bull hill. It will have a capacity of 600 tons every ten hours and will cost about $750,000."——The output from Stratton's Independence for June was about 6000 tons, worth about $525,000.

IDAHO.

ADA COUNTY.

From Boise F. T. Daly states that the Atlanta Mountain mines are sold, and that "it is the intention of the purchasers to put a 250-stamp mill on the mountain, which they buy in its entirety."

BOISE COUNTY.

Around Idaho City mining operations have mostly closed for the season. The dredgers at Warm springs continue through the summer. Pres. Souther and Mgr. Gardner are there now. The new dredger has a capacity of 2000 yards a day. It is a scoop dredger, 65 feet long, 54 feet wide. On it are a pair of hoisting engines, 12x18-inch cylinders, swinging engine, spud engine and compound engine that operates the stacker, grizzlies and pumps. In addition, there is an electric light dynamo and two large boilers. Two shifts of eight men each are employed. There are two grizzlies into which the scoop dumps alternately.

The War Eagle Con. Co. on the Plowman placers for the past three months have had eight giants cutting on the bank, 120 feet high. Operations have ceased for the summer. The gross output is given at $25,000 for the season's run.

The War Eagle Co. has closed down on the Illinois; the Lucky Boy has also been closed down, likewise the Buffalo, with its 10-stamp mill.

The Snake River G. M. Co. of Idaho Falls is putting in a 1000-ton concentrator and a Hallidie wire rope tramway 1000 feet in length, the plant to be in operation Sept. 1st. The gold is very fine and runs from 15 cents upward, the intention being to run the concentrates over plates. W. P. Cantland is manager.

World: The War Eagle Co. is to put up the 20-stamp mill now at the Iowa mine, at Quartzburg, and will put in a new chlorination process in which electricity is used. The company contemplates a 100-

stamp mill in addition to the twenty stamps now on the ground. The tunnel on the Iowa is 500 feet deep; it will be extended to the Yellow Jacket, 3000 feet. The War Eagle Co. has men at work on the Mountain Chief, west of Quartzburg.

CUSTER COUNTY.

The White Knob Copper M. Co. at Cliff, about 7 miles from Houston, has a shaft down 750 feet, and going down at an average of 50 feet per month.

IDAHO COUNTY.

At Grangeville the Deer Lick-Idaho G. M. & S. Co. is organized; E. W. Goodner, secretary; T. F. Parks, general manager. About sixty men are employed.

OWYHEE COUNTY.

Sonnemann & Branscombe at South Mountain, 20 miles southwest of Silver City, have fifteen miners employed on development work, and report a 5-foot ledge averaging 15% lead and 100 ounces in silver.

At Silver City Sorensen & Hogan are reported by the Avalanche to have struck ore in the Great Republic claim "which would go $20 to the pound."

Supt. F. M. Langford of the Melcher M. Co.'s properties, 50 miles north of Elko, Nev., says the tunnel has been driven in 1000 feet and will be extended 1000 feet farther to tap the vein. He has been authorized to increase the force.

Work is to be resumed on the Lexington, 3 miles from Kellogg. The headquarters of the company are in Walla Walla, Wash.

Near Wallace it is estimated that the values lost in tailings when all the mills are running full time is $5000 per day. One plant for treating tailings is in operation, one more is in course of construction and arrangements are completed for the erection of two others.

Green, Robbins & Nelson are preparing to put in a similar plant at Gem.

SHOSHONE COUNTY.

At Wallace the Springfield has a 12-foot vein, carrying 4% copper, about 340 feet from the portal.

At Wallace, the Flagstaff M. Co. has incorporated; capital stock, $100,000; J. B. Thomas, F. T. Millichamp, W. C. Miller, A. E. Carlson, D. E. Mackinnon, directors. The Alameda M. & M. Co. has also incorporated there; capital stock, $75,000. Directors: W. L. James, F. H. Fox, J. B. Taylor, W. R. Russell, I. M. Cornthwait.

MICHIGAN.

HOUGHTON COUNTY.

Houghton reports that mining has been resumed in the Red Jacket shaft of the Calumet & Hecla, and but 50 feet of water remain in the bottom. Shafts Nos. 2 and 3, Hecla, are being ventilated. No access can yet be had to No. 2, the burned shaft.

MONTANA.

DEER LODGE COUNTY.

F. Deckerts, representing Salt Lake and New York men and his own interests, is developing his property, the Copper Camp, above Lincoln, on the Big Blackfoot.

Smeltermen of Anaconda and Great Falls want the same pay received by the employes of smelters of Butte. Butte wages in smelters are 20% higher than those of Anaconda or Great Falls.

FLATHEAD COUNTY.

Near Libby the American Kootenai M. Co., through its resident agent, W. Beager, has bought three claims on the West Fisher from F. G. Horner for $30,000.

GRANITE COUNTY.

Harper & Hamilton, in the Rock Creek district, report placer diggings in Flat gulch.

LEWIS AND CLARKE COUNTY.

Fredericks & James of Hancock, Mich., have a mill site and water right on York gulch at York. They paid for some property $40,000; will buy a stamp mill and will build a cyanide plant in connection with the mill. They say that ore in the Moss Rose runs upwards $20 a ton in gold, and cyaniding tests have saved 95% of the assay value.

The Independent says the Horseshoe M. Co. is developing a group of twenty claims across the Missouri river, 18 miles from Helena. A vein in slate carries copper, silver and gold.

J. A. Widmer, managing the dredge company on the Missouri river below Canyon ferry, will repair the boat and machinery and start again.

Resumption of work on the Humboldt, adjoining the townsite of Helena, is noted by the Independent. The Humboldt has produced $70,000 in silver-lead ore from the pipe in the lime since its discovery. The pipe came to the surface in the lime and previous operations had followed down on it at an angle of 45 degrees until a depth of 400 feet was reached.

Independent: The Helena & Livingston Co. has taken over the bond and lease held by Davis, Buskett & Hudnall on the Justice mine at Rimini. It is the intention to treat the ore in the Peck concentrator at East Helena.——Work has started on the Bullion on the main divide above Rimini.——In the Eureka are forty men at work, superintended by J. H. Steward. The mine is shipping twenty cars of ore a week.——The Bald Butte has good ore in the 600-foot level, the deepest level in the mine. The mine has paid $800,000 in dividends; all its dividends are received by Helena owners. The mine is perhaps the heaviest dividend paying gold mine in the Northwest; it has a continuous dividend record for nearly ten years. The management is opposed to publicity and no dividend notices are published.

MADISON COUNTY.

At Red Bluff the Water Lode is producing ore; the Red Chief is in splendid shape for stoping; the Comstock has ore suitable for cyanide treatment; G. D. B. Turner is operating the property.

A strike is reported in the Navajo mine by the Alder Gulch Times.

J. Whitaker, at work on the Bamboo Chief, has leased the Largey mill.

B. J. Fine proposes to work the Gravel range, 3000 acres of ground, 14 miles south of Virginia City.

E. Smith at Sheridan has charge of the hydraulic and steam derrick of the Ruby Placer Co. on Upper Wisconsin creek. Five hundred inches of water is conveyed by ditches to a high bluff opposite the works and conducted by pipe to a 5-inch monitor. To remove the boulders and large rocks a steam derrick is used.

SILVER BOW COUNTY.

The Parrot S. & C. M. Co., a branch of the Amalgamated Co., has brought an action against Heinze Bros. and the Montana Ore Purchasing Co. to have the defendants perpetually enjoined from alleged encroachment on the ore bodies of the Adventure lode mining claim, of which property the plaintiff says it is the owner. In the complaint the Parrot Co. alleges that the defendants have entered the alleged vein of the Adventure from the 1100-foot level of the Nipper claim and are engaged in extracting ore from it.

The Butte correspondent of the Spokesman-Review says: The eight-hour proposition continues to be the absorbing topic. So far no word has been received from the Amalgamated Copper Co. It remains to be seen what Daniel McDonald, president of the Western Labor Union, will do. The Butte Miners' Union adopted resolutions to continue the struggle until every mine in Silver Bow county is worked on that basis. It was reported that C. S. Batterman and F. Klepetko, general manager Amalgamated Co., consulted Foreman Williams and Shift Boss Dunshee of the Pennsylvania as to the eight-hour movement. They were asked by the officials if they thought they could get as much work out of the men in eight hours as in ten. Both shift boss and foreman were willing to guarantee that they could. Mr. Klepetko was of the same opinion, but Mr. Batterman thought that a change was unnecessary, as ten hours was a working day anywhere. It was rumored last week that Supt. J. O'Neill of the Anaconda properties had notified the committee from the union that his mines could not grant their request for an eight-hour day. It was thought that a refusal of the Amalgamated Co. would result in a clash, and in the end it is believed the union will win, for Butte is essentially a union town. The agitation will extend to all the important mining towns of the State. Wages are 20% higher in Butte than in other places. If a strike is ordered, the union will not be bucking Marcus Daly alone, but the Standard Oil Co.

The Parrot S. & C. Co. wants F. August Heinze enjoined from trespassing or carrying on mining operations on the 1100-foot level of the Nipper. The Parrot Co. claims title to the ore bodies on that level because they are alleged to apex in the surface boundaries of the Adventurer claim, belonging to the plaintiff. It is alleged that Heinze has unlawfully entered it and is mining and extracting ore.

TETON COUNTY.

A. M. Esler, at Altyn, is building a 300-ton concentrator at the Cracker mine. Four hundred thousand tons are designed to be treated during the next three years. He has thirty men.

NEVADA.

CHURCHILL COUNTY.

A $6000 copper smelter is to be put in at the Gardner mine, Cottonwood district.

ELKO COUNTY.

F. A. Sizer, for W. A. Clark, has bonded the Keystone, Commonwealth and Grand Central copper mines, in Dolly Varden district, for $10,000.

ESMERALDA COUNTY.

J. W. Mackay is said to have bought the Silver Peak mines.

General Manager Siegel of the Vulcan C. Co., at Siegelville, has put in a 25 H. P. gas engine hoist at his mine. The first and second levels are being extended. There is some pay ore blocked out.

LANDER COUNTY.

The Nevada company, operating at Galena, has three cars galena ore ready for shipment. The ore carries considerable silver values.

LINCOLN COUNTY.

J. McFarlane, Mgr. Homestake at Deer Lodge, says he will have a mill in operation this month to handle 150 tons of ore daily. He expects to show an average of $20 per ton.

E. H. Hackett will manage the Midnight and Reliance group near the Horsehoe at Deer Lodge for the Newport-Nevada M. Co., organized under the laws of West Virginia.

The De Lamar Co. is again crushing 300 tons daily.——In the southwestern part of the county is Yellow Pine district, 25 by 12 miles, dotted with claims under present conditions almost valueless, owing to isolation, low grade, owned by poor men; still with the limited resources copper and lead ores have been sent to Colorado and New Mexico, giving them a margin for development.——The A. G. Campbell group consists of 24 claims, 20 patented.——The Green Monster, being worked by the Hearst Estate, is a copper mine of merit. ——The Keystone has a record of $800,000 in gold.——Northwest of Yellow Pine is Montgomery district with mines of good values were a railroad near at hand; and east near the Colorado river, and south a distance of 90 miles, are Eldorado, Crescent and Searchlight districts.

STOREY COUNTY.

In the Confidence, Challenge Con. and Con. Imperial mines at Gold Hill the west crosscut from the surface tunnel is out 2466 feet. It advanced 14 feet during the week. The face is in porphyry.

In the Belcher mine, on the 100-foot level, the north drift from the east crosscut has a length of 149 feet. The face shows porphyry and quartz, the latter giving low assays. On the 1100-foot level the Belcher, Crown Point and Yellow Jacket joint drift is being repaired.

WASHOE COUNTY.

Near Olinghouse, W. C. Williams has the Ora mill running on high grade ore. The Ora mine at the 150 level shows 20 inches ore.

WHITE PINE COUNTY.

A new shaft is to be sunk on the Robust mine at Ely.

The Bay State property, under lease and bond by W. F. Snyder, will start work. A 20-stamp mill will be repaired and put in commission. The shaft is down 400 feet.

NEW MEXICO.

BERNALILLO COUNTY.

(Special Correspondence).—The mill of the Cochiti Reduction & Improvement Co. at Woodbury, 6 miles east of Bland, was destroyed by fire to-day. The stockholders of the company are Denver, Colo., men, principally.

Woodbury, June 29.

The Cochiti G. M. Co. in June treated 5000 tons of ore.

COLFAX COUNTY.

The Paragon mine, near Elizabethtown, runs three ounces on the plates.

The Montezuma mine, Elizabethtown district, is to be leased. It has been idle for ten years owing to the impossibility of showing the values—carbonates of lead carrying gold—without concentration, the ore not averaging enough to stand expense of shipment to Pueblo or Denver.

The Ohio G. M. Co. in its main workings at the head of Humbug gulch, Elizabethtown, is in 740 feet, and expect to go 150 feet more to cut the vein.

Baron von Zuylen of the Black Horse mine, near Elizabethtown, belonging to the Four Creeks M. Co., will start his mill with improvements in concentrators and close amalgamators.

The Montezuma G. M. & P. Co. is working three shifts on its Blue Bandana, crosscutting for the Red Bandana lead at the 425-foot level.

The Smithfield G. M. & M. Co. has appointed F. Spurr its New Mexico agent, with headquarters at Elizabethtown. The company is a West Virginia corporation.

GRANT COUNTY.

Rutherford, Smith & Rutherford have incorporated the Wilson M. & M. Co., capital $30,000, offices at Stein's Pass.

The Texas mine at Central has just begun a three-compartment shaft to be sunk to a depth of 1200 feet, when stoping will commence and a new concentrator erected. About fifty men are employed.

SANTA FE COUNTY.

Supt. Wells is running the Cerrillos smelter, with a reduction capacity of eighty tons.

OREGON.

BAKER COUNTY.

The Copper Queen mine, 20 miles northeast of Baker City, owned by Gilkson Bros., is sending ore to Sumpter.

The Baisley-Elkhorn mine shaft is in readiness to be extended 300 feet deeper, making a total depth of 700 feet.

LANE COUNTY.

The Music mine is 35 miles from Cottage Grove, in the Callapooya mountains. It is being constantly operated and has a 10-stamp mill. The Helena mine is operating a 5-stamp mill. The Noonday has a 20-stamp mill; at present it is closed on account of litigation. The Champion, which has a 10-stamp mill, is also closed down. The Grizzly mine is sold to an English company.

UNION COUNTY.

The Cougar, near Granite, is worked through a tunnel. The ore is cyanided.

At Sparta, Mgr. Perkins, in the old Gem mine, is arranging for a 10-stamp mill.

On the Mazama Company's claims, near Sparta, five ledges carry gold.

At Cornucopia the 20-stamp mill of the Cornucopia mine has resumed. The mine is employing 100 men. Alliene Case is resident manager.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Deadwood Independent has discovered "a stratum of gold a mile long, 500 feet wide and 12 feet thick, that can be mined and treated for $1 per ton." "Millions of tons" are available, and "will yield $8 per ton on an average." Further information is vouchsafed to the effect that "the ore is an altered limestone."

UTAH.

Utah dividend-paying mines in the current year have paid $2,370,026, as compared with $1,782,264 for the same period last year.

The complete list of dividend-paying mines of the State, as determined by the Board of Equalization, with net proceeds or assessable value, is as follows:

Horn Silver M. Co., $31,124. Utah Sulphur Co., $2200. Whittemore Bros. & Ballinger, $300. Centennial-Eureka M. Co., $102,431. Jesse Knight, $50,000. Ajax M. Co., $2015. South Swansea M. Co., $30,764. Swansea M. Co., $100,064. Mammoth M. Co., $248,720. Gemini M. Co., $59,204. Godiva M. Co., $27,313. Bullion-Beck & Champion M. Co., $68,165. Grand Central M. Co., $141,261. W. J. Stickney, $81. Ivanhoe M. Co., $23. Petro M. Co., $15,062. R. C. Chambers et al., $636. Highland Boy G. M. Co., $256,350. Daly West M. Co., $195,000. Silver King M. Co., $675,000. Ontario S. M. Co., $110,174. De Lamar Mercur M. Co., $27,650. Mercur G. M. & M. Co., $165,186. Honerine M. Co., $76. Estate I. S. Waterman, $89. Sacramento G. M. Co., $40,000. The Gilson Asphaltum Co., $7084. Jesse Knight, Provo, $10,000. Dixie M. & S. Co., $1483. St. George Copper Co., $2571. Total, $2,370,026.

DAVIS COUNTY.

At Farmington a mill of twenty-five tons daily capacity is to be built by J. Bogan, lessee of Rhymney mine.

EMERY COUNTY.

President St. V. Le Sieur of the Copper Globe Co. tells the Tribune the copper formation there is due to a geyser. The ore assays 50% copper; silver 250 ounces. The copper-laden water deposits incrustations 4 miles down the wash.

JUAB COUNTY.

At Eureka the Eureka Hill mill is operating forty-five stamps. The number is to be increased to sixty.

Miner: D. B. Gillies has completed the survey for the aerial tramway which within two months will be in active operation between the Mammoth mine and mill. It will be similar to the one in use at the Centennial-Eureka, but with a carrying capacity of 800 pounds to each bucket, and 250 tons per day. The distance from the mine to the mill is 4800 feet, the difference in elevation being 350 feet. The structural part will be of iron and work will begin at once on the surface. The estimated cost of the work is $15,000; but it will affect a great saving to the company, as it will enable them to handle the entire output of the mine at a cost of 6 cents per ton. The present cost is 30 cents over the railway. The tram will also carry everything up to the mine, excepting timbers. An iron chute will be built from the mill to the railroad track below and the shipping ores dumped directly into the cars.

PIUTE COUNTY.

Mgr. W. G. Filer, at Gold Mountain, has begun construction of a mill.

SALT LAKE COUNTY.

Tribune, July 1: From the Highland Boy smelter there was yesterday forwarded to the Eastern refineries lot No. 111, consisting of 60,134 pounds of copper, gold and silver bullion, this swelling the total output since June 13, 1899, to nearly 7,000,000 pounds. The month at the smelter recorded the production of 451,938 pounds, and closed with the plant receiving and putting through an average of nearly 300 tons a day.

Upon the arrival of S. Newhouse from the East, arrangements for the construction of the proposed mill on the Boston Con. Co.'s properties at Bingham will be announced.

TOOELE COUNTY.

Tribune: In the Con. Golden Gate & Mercur mines H. A. Cohen will be president and Gen. Mgr.; John Dern, vice-president; Geo. Dern, treasurer; W. H. Cunningham, secretary; G. Z. Edwards, Supt.

UINTAH COUNTY.

Mgr. Sawyer is about to start the smelter erected by the Dyer M. Co. near Vernal.

WASHINGTON.

FERRY COUNTY.

At Republic, Supt. Crumner of the San Poil and Black Tail mines will put in a 12-drill capacity air compressor on Eureka creek.

KING COUNTY.

The value of the gold received at the Seattle assay office in June aggregates more than $1,000,000.

OKANOGAN COUNTY.

Jno. I. Booge writes the Spokane Review from Loomis that at the Puritan mines the force at the mine will be largely increased. Mgr. Chilson has orders to increase the force at the Utica and Oro Fino. At the Bull Frog the work is confined to the raise to connect with the Phantom shaft. Good ore comes from the Black Bear.

PIERCE COUNTY.

The Co-operative is building a smelter at Fairfax to reduce ores, coke being plentiful there.

SNOHOMISH COUNTY.

At Index the Index-Independent, at a depth of 125 feet, a vein of copper glance 10 inches thick is reported.

SPOKANE COUNTY.

New York men propose to buy the old smelter property in Spokane, complete, and operate it. They ask that Spokane take one-seventh of the stock. It was built in 1890 on the Spokane river, 5 miles northwest of the city. It was never operated, and the buildings were finally sold at receiver's sale.

WYOMING.

CARBON COUNTY.

(Special Correspondence).—Battle Lake copper district is about 50 miles south of Rawlins: formation quartzite, schist, diorite and red granite. No systematic mining was done until 1898, when a plant was obtained and several cars of copper ore averaging 40% copper were shipped. The mine was closed during the winter of 1898 and 1899. During the summer of 1899 work was resumed for two months, during which time about 150 tons of high grade copper were taken out. There are large bodies of low grade that, owing to the cost of transportation, cannot be worked to advantage. The ore is in shoots in the quartzite, though with depth it may go to the contact between the quartzite and diorite on the south side of the claim. This group is on the north side of Battle Lake and is owned by the Battle Lake C. Co., controlled by George F. Doane, Congressman Sibley of Pennsylvania and associates. It has not been pushed. The developments consist of a shaft 265 feet, a tunnel and good plant.

On the Hercules claim, one mile east of Battle Lake, the owners have sunk a shaft in a belt of diorite, the south contact of which is red granite, the north quartzite. At 150 feet a crosscut was run to the granite, but only decomposed and oxidized iron found. A crosscut run to the quartzite found three stringers of ore aggregating 9 feet, and running about 20% copper and some gold, and new plant of machinery has been ordered, and this property is to be thoroughly developed.

The Battle C. Co., to the west of the Hercules, has the same formation and a shaft down 125 feet. This property is known as the Ledbetter property, the present manager and original locator being W. C. Ledbetter.

The Ferris-Haggarty mine, 4 miles northwest of Battle Lake, on the north fork of Battle Creek, was opened in September, 1898, since which time it has shipped over 4000 tons of copper ore, 30% copper. The ore lies in shoots on a contact between the quartzite and schist. The development consists of a shaft 3½x7 feet, 80 feet from which 1100 tons of ore was taken that averaged better than 30%; a shaft 4½x9 feet, 185 feet deep, which is now being sunk deeper, a good 6x8 hoister, a 40 and 60 H. P. boiler, pumps and air compressor, etc. The mine is owned by the Ferris-Haggarty Co., and has been poorly managed. The ore is hauled 60 miles to the U. P. Ry. and loaded at Walcott station, most of it going to the Chicago Copper Refining Co., the Argo, Denver, and other places.

Battle.

FOREIGN.

BRITISH COLUMBIA.

The B. C. mine, Summit camp, has increased its force to eighty-five men.

From January 1 to June 5 the Le Roi shipped 28,659 tons copper ore, the War Eagle 10,603 tons, the Center Star 7071, the Van Anda 2958, the Iron Mask 1434 and the Lenora, Mt. Sicker, Vancouver Island, 1200 tons.

The Trail smelter management has a contract with the Enterprise Co. to treat the output of the mine. The Ymir mine will ship to Trail; from the Queen Bess 1000 tons are to be sent via Alamo.

R. C. Pollett at Ymir has bought the El Dorado group, on the north fork of Porcupine creek.

Of the Poorman mine E. R. Woakes says within a short time it will be producing monthly ore to the value of $22,500. He estimates that the required machinery would cost about $50,000. It would be advisable to renew a good deal of the old machinery. "From the Poorman mine I believe we can expect a minimum extraction by amalgamation of $10 per ton, with a further $5 per ton should the cyanide treatment prove satisfactory. The cost per ton should not exceed—mining $4, milling and hauling $1.20, cyanide $2, total $7.20."

Under date of June 30, Rossland reports that shipments for the past week were 4165 tons, all of which came from the Le Roi. The shipments for the six months of 1900 were 72,080 tons.

Men are grading the railroad to the ore bins of the Josie and No. 1 mines, now called Le Roi No. 2.

At Kaslo the Ruth mines have bonded the Mascot claim in the Slocan for $30,000.

The Payne and Slocan Star are exporters to the U. S. smelters. The total shipments from January to June 25 were 5118 tons of ore.

The City of Paris at Boundary has sent a car of galena to be treated in the lead stack at Trail, one of the first shipments of such ore out of the district.

At Ymir, the Ymir mine is running sixty of the eighty stamps. The tunnel is being run to tap the vein at the 1000-foot level.

KOREA.

The Asahi of Japan says that L. S. J. Hunt, formerly of Seattle, Wash., has been awarded a perpetual lease of the Uvson gold mines in Korea. He paid the Korean Government 300,000 yen for the concession.

MEXICO.

The Santa Theresa mine, Sahuayacan district, Chihuahua, is to resume operations. A 20-stamp mill will be put on the property. Enrique C. Creel of Chihuahua has an interest.

Arizona men will work a free milling gold property in the Moctezuma district, Sonora. M. Wellington is Supt.

Throughout Mexico in January there were registered 1318 new mines, with an area of claims of 16,398 hectares of ground. Of these 74 were gold mines, 313 gold and silver, 112 gold, silver and lead, and 120 gold, silver and copper. There were 116 silver mines, 314 silver and lead, 61 silver and copper and 76 copper. The State of Chihuahua registered the largest number, 305; Sonora followed with 205 and Guerrero third with 75.

The Torres & Prietas Railway of Mexico has contracted to deliver to the Grand Central M. Co. 24,000 tons of coal during the next two years, 1000 tons monthly, and delivery began on June 1, 300 tons having gone forward since that date. The coal comes from Gallup, New Mexico, via Albuquerque, Deming, Benson and Nogales.

Two Republics: The output of the three producing mines of El Oro, the Esperanza (120 stamps), the American mine (100 stamps) and the El Carmen (20 stamps), will average 500 tons of metal daily, yielding gold bullion worth $600,000 per month, or over $7,000,000 per annum.

THE KLONDIKE.

The Alaska Exploration Co.'s steamer Gustin, from Dawson and Yukon way ports, was at St. Michael June 15. She brought 300 passengers, partly for Nome and partly for San Francisco, and $2,000,000 in gold dust.

Obituary.

Hamilton Smith, the well-known mining engineer, died at Durham, N. H., on the 4th inst. He was in California a few weeks ago and then seemed in good health. He came first to California in 1868 and since then has been prominent in the mining world. For several years he had been consulting engineer of the London Exploration Co.

Personal.

Chas. Butters is at Berkeley, Cal.

Max Boehmer of Leadville, Colo., is in Butte, Mont.

Capt. DeLamar is expected to be in California from Europe, July 25th.

W. H. Radford has returned to Oakland, Cal., from Trinity county, Cal.

The address of Wm. Chadbourne, formerly of Leadville, Colo., is asked for.

President Goodale of the Taylor Park M. Co., Aspen, Colo., is in Boston.

Deputy Mine Inspector P. H. Clifford is visiting San Miguel county, Colo.

C. W. Davis is to be manager of all the Pinnacle Co. property, Cripple Creek, Colo.

Edw. J. Fowler of the Campo Seco Copper Co., Calaveras county, Cal., is in San Francisco.

J. E. Potter, manager Clio mine, Jacksonville, Cal., arrived at the mine from Boston on the 1st inst.

D. Murphy, of Monaghan & Murphy of Needles, San Bernardino Co., Cal., was in San Francisco last week.

G. A. & G. H. Roberts and B. Ford of Phœnix, Ariz., are examining mining property at Placerville, Cal.

M. Guggenheim's Sons deny that they contemplate consolidation with the American Smelting & Refining Co.

A. L. Waters is now smelter superintendent of the Newton Copper Co. of Ranlett, Amador county, Cal.

J. P. Hutchinson is at Guerrero, Mexico, superintending the erection of a new smelter for the Trinidad M. Co.

R. C. Gemmel of Salt Lake City, Utah, is examining California mining property in Shasta and San Bernardino counties.

A. Raht, former Supt. Arkansas Valley smelter, is at Salt Lake, Utah, to begin work on the new million-dollar smelting plant there.

H. W. Hinckley, for several years a lessee on the Humboldt mine, Leadville, contemplates taking a lease on a property near Ouray, Colo.

F. D. Baker, mechanical engineer, Denver, Colo., is drafting plans for new work at the Pueblo plant of the American Smelting & Refining Co.

T. W. Hickey has resigned as foreman at the Santa Ysabel, Tuolumne Co., Cal., to take a similar position with the Boston Q. M. Co., Napa county, Cal.

J. I. Long, manager of the Hidalgo M. Co. at Parral, Mexico, has arranged for the opening of the railroad recently completed to connect the company's smelters with the Mexican Central Railway.

Mrs. E. C. Atwood of Empire, Colo., was among the principal speakers before the International Mining Congress at Milwaukee, Wis. She talked on "Why Women Should Become Interested in Mining."

C. A. Gehrman and James Bowden have resigned from the management of the Stanley mine, Idaho Springs, Colo. Their places are filled by Mr. Bell, the mining engineer of the company, who will assume the management and Mr. Cyphers the superintendency.

D. F. Brown of Salt Lake City, Utah, has returned via Wrangel on the mail steamer Baranoff from inspection of copper properties, Prince of Wales island. He is employed by Congressman Sulzer of New York and Senator Stewart of Nevada. He thinks the region is rich in copper; but when he was there the snow was deep.

Mining School Graduates.

The following are graduates for 1900 in the mining department of the A. Van der Naillen School of Engineering of San Francisco:

Mining Engineers.—I. C. L. Thomas, Stent, Cal.; G. E. Colbert, San Francisco, Cal.; J. W. Woodford, Martina, Mont.; L. Everett, San Francisco, Cal.; J. D. Helm, Wickenburg, Arizona; E. Schmidt, Congress, Arizona; J. F. McDonald, Bisbee, Arizona; F. Watt, Congress, Arizona; G. F. Rhodes, Berkeley, Cal.; F. C. Davis, Forest, Cal.; E. E. Petty, Nelson, Wash.; A. Muir, Vancouver, B. C.; A. R. McDonald, Vancouver, B. C.; J. E. Gardner, Napa, Cal.; E. Wheeler, Ukiah, Cal.; F. A. Gawthorne, Oroville, Cal.; C. J. Pringle, Half Moon Bay, Cal.; H. C. Glass, San Ramon, Cal.; H. H. Cardwell, Roseville, Cal.; H. B. Tiedeman, Alameda, Cal.; E. B. Olney, Chico, Cal.; H. A. Kuns, Ingomar, Cal.

Assayers.—H. G. Siskom, Shasta, Cal.; J. C. Riggs, Wilcox, Arizona; E. E. McWayne, Drytown, Cal.; P. L. Shelford, Healdsburg, Cal.; C. Farrell, Moyie, B.C.; F. Lucas, San Francisco, Cal.; D. Haberbosch, Selma, Kan.; A. Wrightson, Santa Rosa, Cal.; H. F. Lyon, San Francisco, Cal.; A. E. Foster, San Francisco, Cal.; F. C. Schilke, Dawson; H. Norman, Keswick, Cal.; E. B. James, Groveland, Cal.; H. T. Coffin, Portland, Or.; W. D. Davidson, Bodie, Cal.; N. Wrinkle, Keeler, Cal.; R. Wrightson, Keswick, Cal.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING JUNE 26, 1900

652,587.—Pack Saddle—E. F. Bliss, Providence, Ariz.
652,588.—Filter Press—M. P. Boag, Golden Gate, Cal.
652,663.—Sulphuration Tank—E. C. Burr, S. F.
652,662.—Carbonators—E. C. Burr, S. F.
652,664.—Filter Press—E. C. Burr, S. F.
652,665.—Pulp Press—E. C. Burr, S. F.
652,715.—Hydraulic Motor—E. F. Cassel, Juneau, Alaska.
652,253.—Thermostat—T. B. & F. A. Duncan, Newberg, Or.
652,605.—Manhole Cover—E. A. Faller, S. F.
652,513.—Cultivator—G. J. Friend, Kingsley, Or.
652,556.—Snap Hook—J. A. Garitt, Waitsburg, Wash.
652,557.—Stove—W. R. Hampden, Spokane, Wash.
652,264.—Sad-Iron Handle—Hawkins & Snelling, Lakeview, Or.
652,559.—Air Pump—C. M. Hobby, San Diego, Cal.
652,395.—Excavator—I. P. Lambing, Denver, Colo.
652,367.—Pipe Cutter—T. Law, San Jacinto, Cal.
652,370.—Paper Wrapper—W. P. Murphy, San Jose, Cal.
652,546.—Indicator—W. F. Murray, S. F.
652,567.—Desk Attachment—C. F. Nesse, Elko, Nev.
652,546.—Mail-Box Time Indicator—M. S. Norton, S. F.
652,696.—Wire Splicing Tool—C. D. Smith, Corning, Cal.
652,300.—Signature Gatherer—D. M. Smyth, Pasadena, Cal.
652,649.—Key-Hole Guard—Priscilla Stephens, Express, Or.
652,492.—Refrigerator—C. J. Stuart, Puyallup, Wash.
652,411.—Index—A. W. Theirkoff, Redding, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Apparatus for Plastering Columns or the Like.—No. 651,957. June 19, 1900. J. R. Tobin, San Francisco, Cal. This invention relates to a device which is designed for use in plastering columns, pilasters and similar surfaces for the purpose of making the plastered surface of an equal thickness, and to maintain an equal diameter and outline of the cylinder or other column after it has been finished. It consists of a bar which acts as a surfacer for the body of the column and removable and replacable guide rings for the upper and lower ends of the bar, said rings forming a gauge for the plaster, and each formed of a plurality of segments hinged together at one end so that they may be opened and closed to detachably fit the column, and means for detachably uniting the free ends of the segments.

Index for Mechanical Account Apparatus.—No. 652,411. Dated June 26, 1900. A. W. Thierkoff, Redding, Cal. This invention relates to a means for indexing and finding accounts which are carried upon a mechanical drum or like apparatus. It consists in the combination with a rotatable carrier of bills, of tabular surfaces adapted to receive the bills or accounts and expose them for inspection, an index to correspond with said accounts, a lever movable with relation to the index and a stop moved in unison with said lever, a series of projections or bumpers carried by the account drum and arranged out of direct alignment with each other, whereby the stop is caused to arrest the drum and a lever movable with relation to the index and accounts.

Screw Holder and Driver.—No. 651,949. June 19, 1900. T. R. Lillie, Lodi, Cal. The object of this invention is to provide a device for holding and starting screws and afterwards turning them into position. It consists of arms having jaws at one end adapted to clasp the head and shank of a screw, said arms first diverging from the jaws, and afterwards converging, having their opposite ends fulcrumed to a transverse bar having a central hole through which the shank of the screwdriver is freely slidable; a second bar intermediate between the fulcrum bar and the jaws having closed slots in its ends fitting and slidable upon the inclined arms of the holding jaws, a spring interposed between the bars and acting to normally separate the bars and close the jaws together, arms fixed upon the intermediate bar extending beyond the holding jaws so as to contact with the surface into which the screw is being driven, and thus force the slidable arm back so that the jaws are opened to allow the point of the driver to advance through them and complete the seating of the screw.

WINDING DRUM INDICATOR. — No. 652,546. Dated June 26, 1900. W. F. Murray, San Francisco, Cal. This invention relates to a means for applying an indicator to winding drums of that class in which the drum is turnable upon a shaft and to which power is applied from the shaft by means of a friction clutch, so that the operator can know accurately at all times how much rope has been paid out or wound up, in order to know where the cage may be, especially when used in deep mines. It consists of a drum loosely revoluble upon the driving shaft, a frictional device, one member of which is fixed to and revoluble with the shaft and the other member carried by the drum, mechanism for engaging and disengaging the clutch devices, a transmitting gear adapted to engage with the drum or a driven part and to transmit motion to an indicator arm, and a space dial over which the indicator is moved in unison with the movements of the drum.

MAIL BOX TIME INDICATOR. — No. 652,549. Dated June 26, 1900. M. S. Norton, San Francisco, Cal. Assigned to the Postal Device and Improvement Co. of the same place. The object of this invention is to provide a mechanically movable device and means by which information is exposed through the front of the apparatus to indicate the times when mails are collected, the outgoing mail with which such collections will connect, and other matter necessary or useful for the depositor to know. It comprises a centrally pivoted disk carrying the hours of collection, an opening through the case through which the different hours are exposed, means for automatically returning the disk at the end of each week day's collection, and an automatic mechanism whereby the collections of Sundays or other days different from those of the week day are also indicated, together with means whereby the indicator is always returned to the starting point in readiness for the following day's collections.

EXCAVATORS. — No. 652,395. Dated June 26, 1900. I. P. Lambing, Denver, Colo. This apparatus is designed for excavating and moving earth or like material. It consists of revolubly journaled buckets with closed ends and a scroll-shaped periphery, the curvature of which increases outwardly from the periphery of the bucket through the cutting edges carried upon the exterior of the scroll. The buckets are so journaled that when reversed the outward cutting edges are presented downwardly, so that when rotated through the material to be excavated they cut out a sufficient portion to fill the bucket, and as they approach each other these cutting edges are turned upwardly so as to lie side by side in parallel vertical planes without intersecting. By means of circular pulleys and ropes or chains they are rotated to open and fill themselves. The ropes or chains are connected with a vertically slidable piston movable in a cylinder mounted upon a base plate and operated by any medium under pressure by which the piston is reciprocated to actuate the buckets.

Books Received.

"Park's Cyanide Process," revised and enlarged from the third edition, just out; 128 pages. There have been a good many orders received for this book, which could not be filled. It is published by J. B. Lippincott & Co. of Philadelphia, or can be sent direct postpaid; price $2.50. New illustrations and tables have been added, and discussion of treatment of slimes, analyses of solutions, etc., has been brought up to date.

"The Metallurgy of Silver," by H. F. Collins, edited by Sir W. C. Roberts-Austen, 4to, 352 pages, an unusually complete work, principally compilation from standard works and treatises on the same subject, with full credit therefor, and valuable addition of matter concerning treatment of argentiferous mattes, and silver-copper smelting and refining. Published by J. B. Lippincott, Philadelphia.

Latest Market Reports.

SAN FRANCISCO, July 5, 1900.

SILVER—Per oz., Troy: London, 28⅞d (standard ounce, 925 fine); New York, bar silver, 61⅝c (1000 fine); San Francisco, 61⅝c; Mexican dollars, 49¾c.

To Port Arthur silver is now being shipped in quantities that affect the Eastern market. One mine alone in Australia is reported to have a standing order for 50,000 ounces a week.

COPPER.—New York: Lake, 1 to 3 casks, 16.65 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.12½; Casting, 1 to 3 casks, 16.37½; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.25; Salt Lake City, 4.10½; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7, sheet 8, bar 6c. London, £17 10s = 3.80c per ℔.

The new prices made by the American Smelting & Refining Co., for shipment before August 1, seller's option, 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$4 20	$4 30
Chicago	4 20	4 30
Cincinnati	4 25	4 35
Pittsburg	4 30	4 40
Philadelphia	4 30	4 40
New York	4 25	4 40
Boston	4 32½	4 42½

On lots of less than 50 tons 5 cents per 100 lbs. higher.

Lead is being exported at $3.75 per 100 pounds.

SPELTER. — New York, $4.25; St. Louis, $4.10; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, pig, No. 2, foundry, $19.50; gray forge, $18.00; San Francisco, bar, per lb., 3c.

STEEL. — Billets, Pittsburg, $27.50; bars, $30.50; San Francisco, bar, 11c to 18c per lb.

Pittsburg wires that on the 1st inst. the Shenango Furnace Association put Bessemer on a basis of $20 valleys, which carries with it a corresponding relation in the price of all other materials, raw and semi-finish. Foundry irons have experienced a considerable drop in anticipation of the reduction and further decline is imminent.

QUICKSILVER. — New York, $50.00; London, £9 10s; San Francisco, local, $49.50 ⅌ flask of 76½ ℔s.; Export, $47.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 20¼c; San Francisco, Plumbers', 100-℔. lots, 17c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $30.00; San Francisco, ton lots, 31½c; 1000 ℔s., 32c; 500 ℔s., 33c; less, 34c; bar tin, ⅌ ℔, 37c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., $1; San Francisco, $1.25.

FERRO-TUNGSTEN. — New York, 37%, 40c; San Francisco, 75c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, $125.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 33@35c ⅌ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾ @ 2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 45@50c ⅌ ℔.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ⅌ set; 14 oz., 40s., 10½c.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 25) has been postponed to MONDAY, the 16th day of July, 1900, and the day of sale from the 21st day of July, 1900, to TUESDAY, the 7th day of August, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

Notice of Application for Dissolution.

In the Superior Court in and for the City and County of San Francisco, State of California.

In the Matter of the Voluntary Dissolution of the South Paloma Gold Mining Company, Limited. (a corporation.)

Notice is hereby given that the South Paloma Gold Mining Company, Limited, a corporation created and existing under the laws of the State of California, has presented to the Superior Court of the City and County of San Francisco, State of California, a petition praying for a judgment and decree declaring the said corporation dissolved according to law; and that said application will be heard on TUESDAY, the 31st day of July, 1900, at 10 o'clock of said day, or as soon thereafter as counsel can be heard, at the court room of said Superior Court, Department No. 3 thereof, at the New City Hall, in the city and county aforesaid.

Witness my hand and the seal of said Court the 25th day of June, A. D. 1900.

WOODBURY'S IMPERIAL
CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

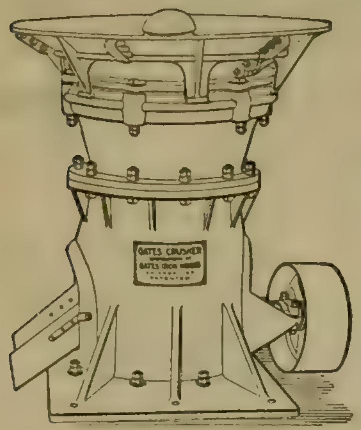
CATES IRON WORKS.



The Original GYRATORY BREAKER.

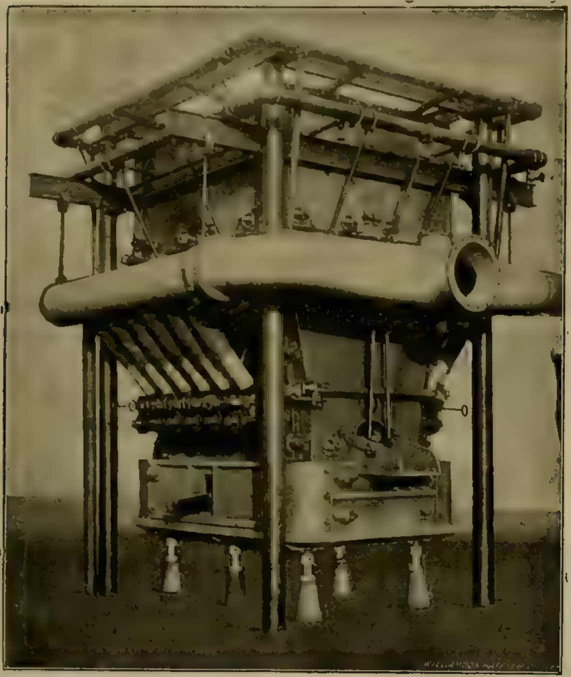
It is ADJUSTABLE, and INDESTRUCTIBLE.

THERE ARE 4,000 OF THEM IN USE.

The South African Mines Have Purchased 200.

. . We build a FINE CRUSHER that is a wonder. . We know how to design this class of machinery. . . . There are others who think they know how to make a Gyratory Crusher; they are simply poor imitators of The Only Great Gates Rock and Ore Breaker. .

Address for Catalogue No. 1, Dept. UU, 650 Elston Ave., CHICAGO.



A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

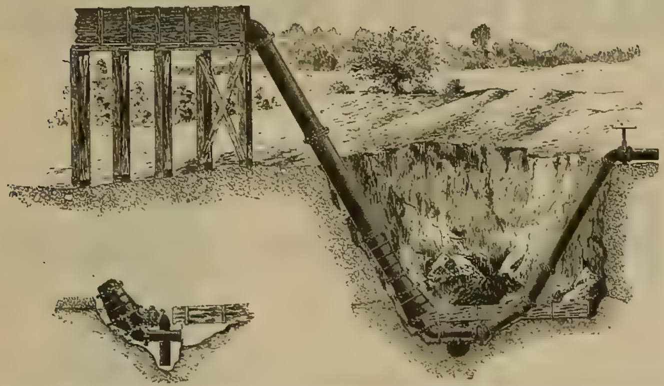
SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,



Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

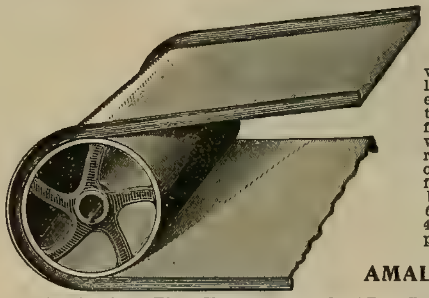
SPADONE'S CONCENTRATOR BELTS.



PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE BLAZED PATH

IS A GOOD ONE TO FOLLOW.

The money-making manufacturers advertise in this paper with most successful results. Results are what count.

You can buy advertising space for less money elsewhere, but you can't buy a CHEAPER advertisement. Cheapness is not regulated by what you pay, but by what you get for what you pay.

In the MINING AND SCIENTIFIC PRESS you reach over 30,000 probable customers fifty-two times a year.

330 MARKET ST., SAN FRANCISCO, CAL.

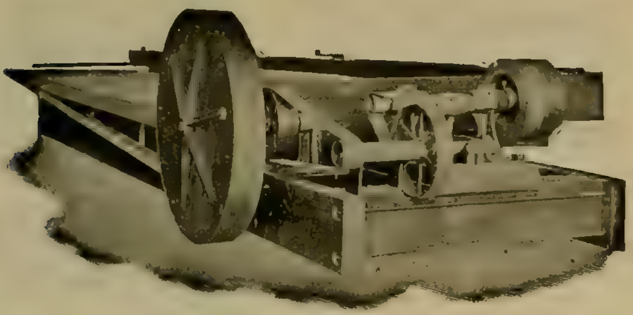
WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

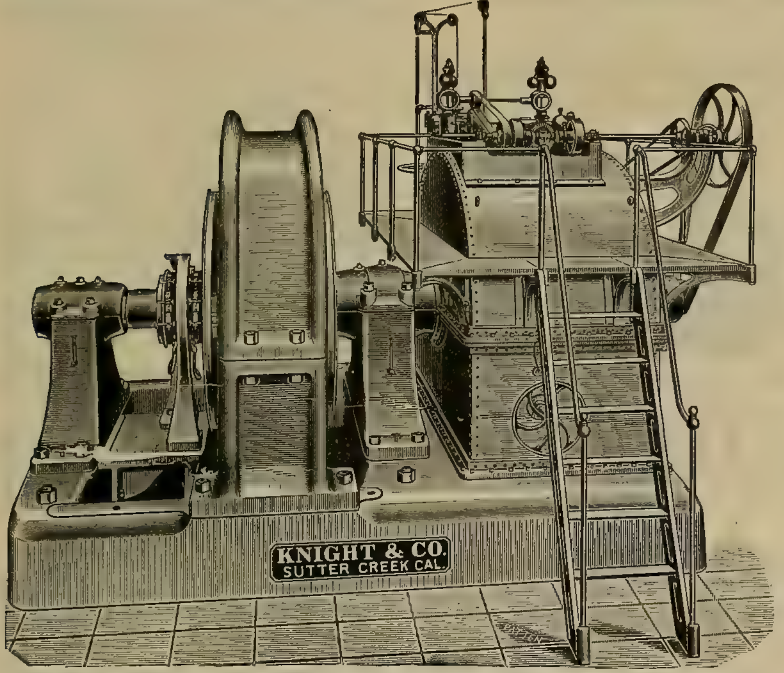
Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—— SEND FOR CIRCULARS. ——

These Machines are Kept in Stock Ready for Immediate Shipment.

KNIGHT'S WATER WHEEL.



KNIGHT & CO.
SUTTER CREEK CAL.

The accompanying cut shows the general arrangement of **The Knight Water Wheel**, direc-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.

These wheels are designed for **100 to 2500 H. P. Highest efficiency and regulation guaranteed.**

WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.

Wheels for mill and reversible hoisting works a specialty.

SMOOTH-ON CASTINGS.

TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

Are You Confronted With a Difficult Ore-Separating Problem?

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

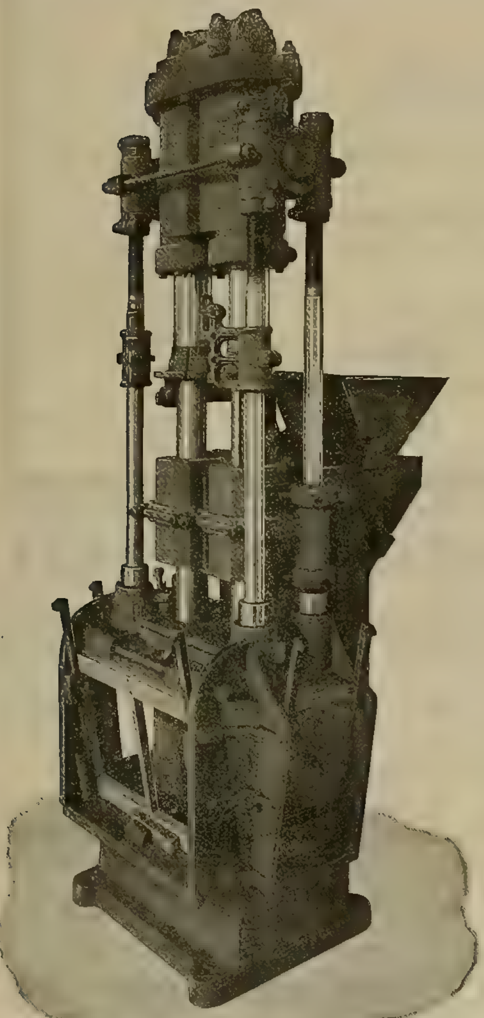
GATES IRON WORKS.



THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,

[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,

M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ, AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,

[SIGNED] GEO. HEWER.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

ASSESSMENT NOTICES.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

DELINQUENT SALE NOTICE.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 19th day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
J. P. E. Heintz	156	1.000	$100 00
Wm. A. Junker	71	500	50 00
Annie D. Weeks	133	500	50 00

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific. Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

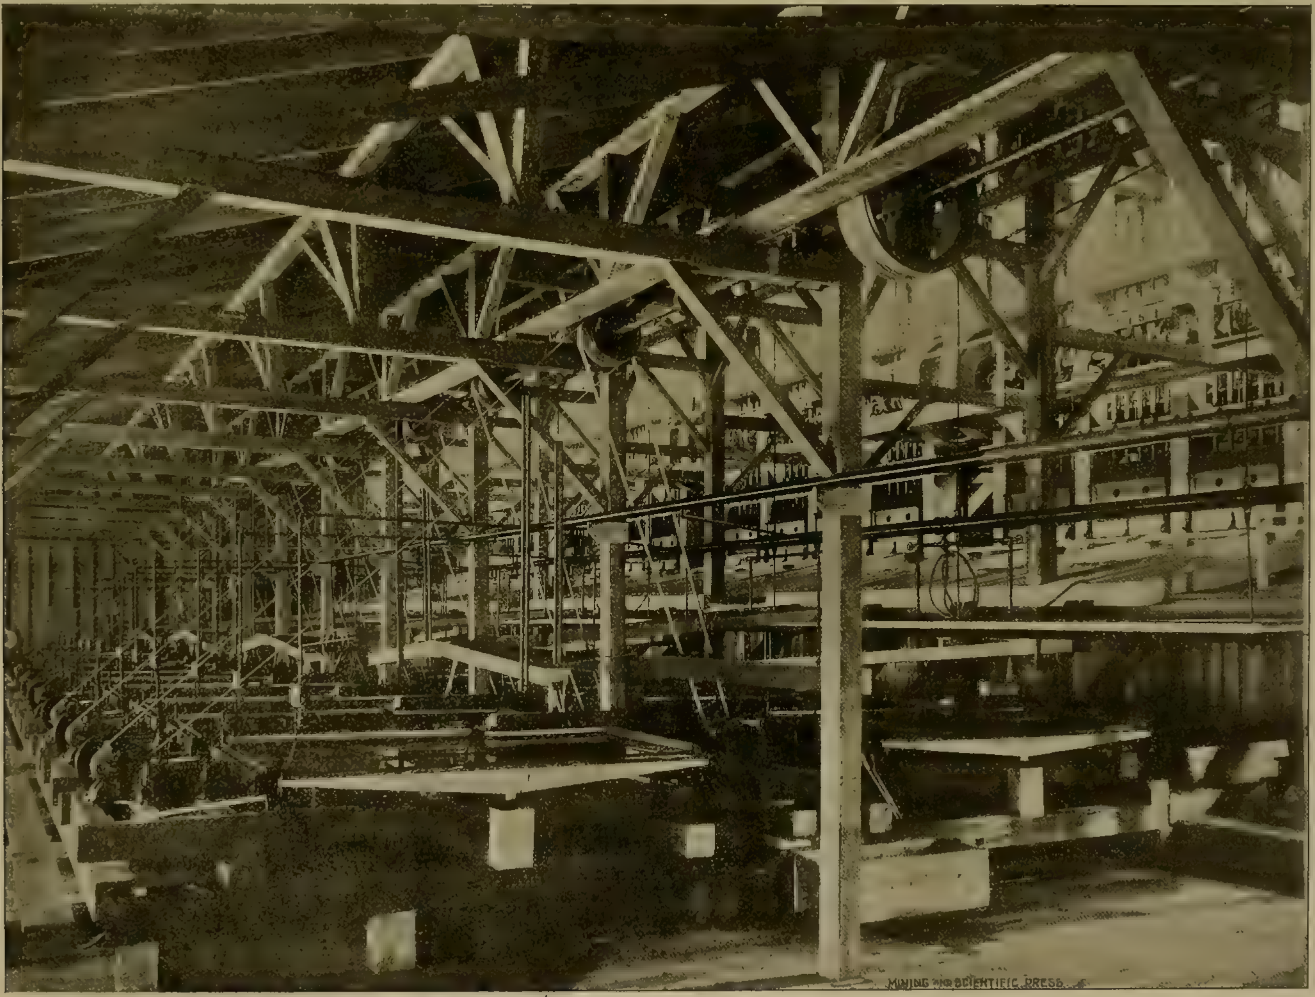
High Explosives.

In the three preceding issues of this paper have appeared technical articles on dynamites and their manufacture, details of the make-up and method of application of the principal high explosives in present use. In the current number of the International Monthly appears an article on the same general subject by Capt. E. L. Zalinski, whose "dynamite gun" attracted some attention two years ago in the American squadron's practice off the Cuban coast. A condensation of Capt. Zalinski's article may serve as a fitting conclusion to what has already appeared herein concerning this subject.



Interior View of the 80-Stamp Mill at the Boston & Denver M. & M. Co., Blackhawk, Colorado.—(See page 42).

He considers that the touchstone of experience has eliminated from practical use most of the explosives which have recently been presented in such large numbers, there being now left, as the chief explosives in use, nitro-glycerine, gun cotton, dynamites consisting of nitro-glycerine combined in various proportions with various bases; blasting gelatine; explosive gelatines and gelatine dynamites consisting of various combinations of nitro-glycerine and gun cotton, with a mixture of saltpetre, cellulose and soda. Besides these are the Sprengel group of explosives. This consists of two practically inert substances, which, upon being mixed, produce powerful explosives. One of these substances is usually a hydrocarbon. An almost infinite variety of explosives of this class has been produced. Whenever an announcement is made of a new high explosive, insensitive and powerful, with secret ingredients, one is likely to be correct in the assumption that it is of the Sprengel group. Among the better known of these are:

Rack-a-rock—Chlorate of potash and a liquid hydrocarbon (dead oil). Two hundred and fifty thousand pounds of this explosive were used in blasting out Hell Gate. Bellite—ammonium nitrate, nitro-benzole and saltpetre. Roburite—ammonium nitrate with chlorinated di-nitro benzole. Hellofite—naphthalene, phenol or benzine in fuming nitric acid. Securite—meta di-nitro benzole with nitrate of ammonia or saltpetre.

The composition of a sufficient number of this class of explosives has been given, to indicate the variety of constituents which can be used in making high explosives of this group. They are all insensitive and require a very powerful initial explosion to educe their full power. Those having nitrate of ammonium are likely to be objectionable and not of advantage in submarine work and places where water is present, owing to the hygroscopic quality of that salt, which tends to deliquesce, unless well protected from moisture. Two recent explosives, of secret composition, which have been much vaunted, marsite and thorite, probably belong to this class. It is thought that the latter may be usefully employed for the torpedo shell, but it is as yet a question whether it can be completely exploded when in large charges, so as to give an explosion of the first order.

In the opinion of Capt. Zalinski the picric acid class of explosives deserves attention, more because of public notoriety than of intrinsic merit. Among these are melinite, for which the French have claimed so much, and lyddite, used by the English in the South African war. These are both essentially the same, consisting chiefly of picric acid combined with nitro-cellulose, and in some cases with cresilite.

The relative power of explosives is difficult to estimate, and authorities differ regarding it, for there is a notable difference in the results obtainable, depending on the physical conditions attendant upon the placement of the explosive and the means and method of the initial explosion. Some confinement or tamping is essential; the difference in the results secured between an explosion in the open and when covered, however slightly, is very great, and should be borne in mind by those using explosives for industrial purposes. The same amount or degree of tamping is not as necessary for the high explosives as for gunpowder, and much needless and dangerous work might be avoided if due consideration were given to this point of difference. According to the best authorities, the following table is given as showing the relative force of the various high explosives, submarine work excepted, gunpowder being taken as one:

Gunpowder, 1; dynamite No. 1, 10; gun cotton 5.5; bellite (Sprengel), 6; nitro-glycerine, 12; roburite (Sprengel), 3; explosive gelatine, 14; melinite, 3; blasting gelatine, 16; lyddite, 3.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:
United States, Mexico and Canada........$3 00
All Other Countries in the Postal Union........4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN........Publisher.

Special Representatives:

EASTERN.
E. H. HAVEN........150 Nassau St., New York City.
MIDDLE WEST.
CHAS. D. SPALDING........153 La Salle St., Chicago, Ill.
INTER-MOUNTAIN.
W. A. SCOTT........43 Jacobson Building, Denver, Colo.
SOUTHERN CALIFORNIA.
W. D. CURTIS........223 W. Second St., Los Angeles, Cal.

San Francisco, July 14, 1900.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Interior View of the 80-Stamp Mill at the Boston & Denver M. & M. Co., Blackhawk, Colorado, 33. Volcanic Vent in Granite, at Victor, Cripple Creek, 37. Latest Mining and Metallurgical Patents, 38. Clean-Up Pan and Whin; Sturtevant Roll Jaw Crusher, 39. Hoist at Cook Mine, Blackhawk, Gilpin County, Colo.; Interior Shaft House, Cook Mine, Blackhawk, Gilpin County, Colo., 40.

EDITORIAL.—The Telephone in Business; An Advance in Silver; Heartily Appreciated; Miscellaneous, 34.

MINING SUMMARY.—41-42-43.

LATEST MARKET REPORTS.—44.

MISCELLANEOUS.—High Explosives, 33. Concentrates, 35. The Cripple Creek Volcano, 36. The Factors in Concentration, 37. Latest Mining and Metallurgical Patents, 38. Born Before the Flood; Clean-Up Pan and Amalgam Safe; Quartzite and Whin; A Three-Candle Power Incandescent Lamp; Sturtevant Roll Jaw Crusher; Concentration of Ores by Petroleum; Central California Electric Co., 40. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received; Recently Declared Mining Dividends; Commercial Paragraphs, 43-44.

PRESENT CONDITIONS in the Witwatersrand, South Africa, mining district illustrate forcibly the advantage of a mining investment as a permanent proposition. Though the storm of war has swept the surface of the Rand the mines themselves are intact. The value of the ore therein can not be destroyed by fire or water, nor any destruction wreaked by revenge. Of no other industry can this be said. Any other form of industrial life would have been annihilated by the warfare of the past few months there; but in sixty days after the cessation of hostilities the Johannesburg mines will be turning out gold profitably as heretofore. Nor is there any depreciation in the price of the product in the markets of the world, nor do the producers have to seek customers, for coined or in bullion the refined product is worth $20.67 per ounce the world over. Of no other industry can these things be truthfully said.

◆

IT was noted herein some months ago that while in the nature of the case mining precluded the formation of "trusts" in their present meaning, yet the tendency in mine management is to follow the example of the trusts in observance of the intents and purposes that characterized their initial movements, viz: consolidation, because of economy of operation. Since then several mines in Cripple Creek district, Colo., the Mercur and Golden Gate properties in Utah, two in South Dakota and two in Idaho have consolidated with economic intent, and now from southern Nevada is report of similar negotiations by the April Fool and DeLamar. Such is the tendency of the times. In connection therewith it is to be noted that in such consolidation lies partial solution of the problems of "apexes" and "extralateral rights." It were vastly easier for two contiguous properties to consolidate than to fight over incursions into each other's property, besides the saving occasioned by such action.

◆

SENSATIONAL "scientific" announcements in Sunday papers and popular magazines serve a good purpose as light summer reading, but are not to be taken seriously. N. Tesla is usually good for a column of alleged statement of fact, his latest being announcement that aluminum will so supersede copper as to render the red metal of secondary value. P. Metchnikoff, of the Pasteur Institute, is credited with discovery of "a series of lymphs," which, properly introduced into the human body, will "check decay and indefinitely prolong life." M. Metchnikoff naturally denies and dislikes such statement, modestly saying that he is "a scientist and not a charlatan," that he is studying certain forms of disease from decay, and hopes later on to have some results of possible value, which is about what a true scientist would say. Men who really do something—Bessemer, Thompson, Edison and such as they—first made sure that what they gave out was accurate, and never indulged in fanciful prophecies in flash journals, nor announced what they were "going" to do.

The Telephone in Business.

Recent mention of the Western Union Telegraph Co.'s intent to apply twenty million dollars to active competition in long distance telephone service illustrates how that device is entering into intimate commercial life, and how it is eating into the business of the telegraph company. It is equally noticeable how telephony has cut into the business of the railroads. Railway managers say that since the introduction of long distance telephone systems travel is much lighter. This is evident. It is vastly easier for a San Francisco man to talk to a Los Angeles correspondent, or a Chicago man to a New York resident, than to travel between the two cities, and to all intents and purposes a talk over a long distance telephone has all the practical points of a private, personal interview at much less cost and with equally satisfactory results.

The great advantage of the telephone over any other means of communication is that one is in direct communication with his correspondent, that his message is replied to on the spot, that there can be no reason for mistakes, no misunderstanding of the message; that each party to the interview knows at once what the other says, clearly and fully, and that without leaving one's own home or office he can have all the advantage of an immediate personal talk without the expense or annoyance of travel or the delay incidental to letters or even telegrams. Great as is the increase in the telephone service it is probable that it will extend still more; for despite its drawbacks and incidental annoyance, its advantages so outweigh those that it is universally recognized as an economical business proposition. More especially does it cater to the wants and tastes of the American people who always would fain do two days' work in one and compress the affairs of a day into an hour. This is the great claim of the telephone, that it makes it possible to do in one minute what before took an hour; or in five minutes what used to require an entire day. It enlarges the volume of business, shortens the time, and lessens the labor of its transaction.

The scientific importance of the telephone has long been distanced by its practical commercial application. Men who by reason of their position should know what they are talking about claim that it is possible to establish telephonic communication with Europe, for, while there is too great resistance to successfully operate a direct telephone cable across the Atlantic, it is claimed that by a longer route, with landings at the different islands, it will be entirely feasible to construct an international telephone line that would give good practical results. At present toll line conversations in this country are held over distances of 2000 miles; as, for instance, San Diego, California, to Boise, Idaho. Like all other great enterprises, only more especially in this case, the tendency of telephone management is toward monopoly and exclusive control, and it is probable that the result of present combinations and consolidations and pooling of issues will be the operation and control of the telephone service of the entire country under one general management.

The profits of the service are enormous. With the exception of transportation to Alaska, there is probably no money invested in any enterprise that produces such great and immediate return in per cent of profits as that invested in telephones, and paradoxical as it may seem, that very fact, which would ordinarily invite competition, will tend more than anything else to demoralize opposition and result in a close monopoly.

Like other forms of electrical appliance, telephony is a progressive science. The latest development is the telephonograph, devised by M. Paulsen, Leipzig, Germany. It is described as "a combination of a telephone and a phonograph for the purpose of recording messages received during the absence of the operator. The person called up has only to hold the trumpet to his ear upon returning to the office, even after an absence of days, to receive the message. Many inventors have tried to effect sucha combination, but all failed on account of the difficulty of transferring the message onto a wax cylinder."

Instead of a wax cylinder, Paulsen uses a flexible steel band in his phonograph, messages being more easily removed from the steel band than from the wax cylinder. The band is wound on two spools, moving quickly from one to the other, coming in contact with a very small electro-magnet, switched into the circuit, which affects the steel band in such a way as to record on it any sounds that may penetrate to the phonograph. The inventor says: "It is only necessary to cause the steel band to repass the magnet in order to have the sounds repeated. Each vibration of the electro-magnet produces a corresponding vibration of the steel band. In order to remove a message from the steel band, a magnet is passed over the surfacc on which the message was recorded."

An Advance in Silver.

The silver market has improved since the close of the fiscal year and an upward movement is noted. Two causes contribute to this, the first being the demand from the Indian Government, owing to an increase in coinage, and in China the present troublous conditions in that country have stimulated the export trade and diminished the imports. Present hostilities in the latter country have caused some hoarding and have restricted the selling of European wares. The Chinese banks have consequently found themselves called upon for larger quantities of silver than usual. The second cause of the advance arising from this must be credited to the smelting trust. The American Smelting & Refining Co. keeps silver bullion off a weak or failing market, and in the case cited the demand was exploited by the utmost possible advance in price.

As noted in last week's issue, Russia also appears in the market. Silver is now being shipped to Port Arthur in considerable quantities—apparently to the Russo-Chinese bank, a sort of political institution. The Russians are probably desirous of accumulation of a big military chest with the kind of money in it that the Orient wants. In connection with this whole matter, it is also to be noticed that, in the shipment of gold, that metal comes back; but in the shipment of silver to the Orient, it is absorbed. India, China and now Russia constitute sinks of silver, and to the demand from these three countries may be ascribed its recent rise in value.

Heartily Appreciated.

With cordial appreciation is noted numerous kindly references to this paper in the columns of its contemporaries. In these days of numerous publications any journal can count itself fortunate to be able to secure favorable notice among its fellows, and because of this we feel it all the more complimentary that such praise is accorded this paper in so many friendly columns. It will be our endeavor to deserve it. To reproduce the hundreds of editorial expressions of good will and esteem would take up about all the space in one issue. The Denver Daily Post begins an article that would take over a column of our space this way:

> The MINING AND SCIENTIFIC PRESS of San Francisco closed its eightieth volume June 30th. It is not extravagant to say that for the miners of the West—gold, silver, copper, coal and iron—it is the best newspaper of its class in the English language.

In a three-quarter column article the Denver Mining Reporter says:

> The MINING AND SCIENTIFIC PRESS is the best chamber of commerce San Francisco ever had. Its story is told weekly to thousands of people who never heard if there be such a thing in San Francisco as a chamber of commerce.

These are samples of what is said about this paper by many competent critics in kindly confirmation of the facts, and we may be pardoned for an expression of pleasure therein.

Concentrates.

A "KNOT" is a nautical mile, and is equal to 6080.27 feet, or 1.15156 statute miles.

FLUOR SPAR is worth $5 or $6 per ton, delivered to iron smelters. There is little demand for it west of the Rockies.

GOLD and silver dissolve at nearly the same rate, atom for atom, in solutions containing equal proportions of potassium cyanide.

CERITE is an ore found in Sweden, containing silicates and oxides of cerium, didymium and lauthanum, and is imported free of duty.

THE Stevens process is essentially a chloro-bromo process, and if successful anywhere the fact has as successfully eluded general observation.

THE only substance which will act as a screen for magnetism is iron. Surround a space with a thick shield of iron and magnetism cannot penetrate it.

THE lighted candle test for foul air is not a safe one. Gas destructive to human life, yet permitting a candle to remain lighted, may exist in underground workings.

IN the case of corrosive mine waters, iron or lead pipe are usually unavailable unless lined with ¾-inch pine. Bronze is probably the best material to use in such cases.

THERE is little use for selenium except in electrical use, and even in that only to a very limited extent. It is not a United States production, but is imported from Germany.

PLATINUM has been found in the sands of the Yukon creeks, but there is no record of the amount saved. The account of the richness of those sands in platinum is doubtless exaggerated.

DIAMONDS of fair size and considerable value have been found in Butte and El Dorado counties, Cal., but no systematic or continued effort to determine their source has been put in practice.

CELESTINE is not found west of the Rockies. It is sulphate of strontium, is somewhat like barytes, and is used for making red fire and in beet sugar refining. It is worth about $3 per ton.

A STEAM ENGINE, the cylinder of which is 2x4 inches, at sixty pounds boiler pressure, and with 150 revolutions per minute, would develop about 5 H. P., and would need a boiler having 10 square feet of fire heating surface.

A TON OF COAL—2000 pounds—has a heating capacity of about 28,000,000 units. A barrel of petroleum (42 gallons, or about 275 pounds) has a heating capacity of about 3,500,000 units, or one-eighth as much as a ton of coal.

UNDER ordinary conditions a grade of 180 feet to the mile would suffice for a self-acting gravity tramway. The weight of the car, the load, the size of the cable, the length of the line, are among the factors in the matter.

SO FAR as known, native copper is found in Arizona only in the Buster mine, Bradford mountain, where it occurs in leaf-like sheets in maximum size of 6x14 inches, and ¼-inch thick. It is more in the nature of a deposit than vein matter.

KAOLIN is not an uncommon deposit, nor of especial value. Ordinarily a kaolin bed will yield about one-third "China clay," as the material used is called. Unless specially favorably located, transportation charges would eat up the profit of production.

A "MILL RUN" of ore is ordinarily understood to mean a test of the value of a lot of ore large enough to be run through a quartz mill. It cannot, in that sense, be justly applied to a sample or small quantity. A "mill run" deals with tons, rather than pounds.

THE advantage and superiority of the metric system is unquestionable, and some day the United States will adopt it. We are a conservative people in some things, and it is only conservatism and inertia that keep in use the present system of weights and measures.

TO PLATINIZE fine copper or brass articles take 800 grams sal-ammoniac, 10 grams platinum-sal-ammoniac and heat to 212° F., with 400 grams water in a porcelain dish, place the article to be platinized therein, remove after ten minutes, dry and polish with whiting.

HENRY PICHOIR of San Francisco died October 24, 1898; Capt. Thomas Mein died at Oakland, Cal., on May 4, 1900; Hamilton Smith, as noted in last week's issue, at Durham, N. H., on the 4th inst. Many of the old and famous California miners are passing away.

A BELTED governor is not reliable in regulating the speed of a dynamo engine. The belt creeps irregularly under variation of speed in the governor, and has unequal tension from variation in the moisture of the engine room. It is also liable to slip and more liable to accident than gear-driven governors.

A LIEN for wages given by statute on all the property of a corporation in preference to all other liens except recorded mortgages and deeds of trust, in case of failure to pay employes monthly, is held (in Johnson vs. Goodyear M. Co., 47 Cal., L. R. A., 338) to constitute an unconstitutional discrimination against corporations and their employes.

REGARDING the statement in the issue of June 30, concerning hard-drawn copper wire, it is to be further said that soft-drawn copper wire is best adapted for dynamos, motors, etc., and any place where the wire must be bent to short turns, and where flexibility and high conductivity are the essential points. Hard-drawn copper wire is best adapted for line work, such as telephone lines and electric railway trolleys and feeders, or where the ability to stand strain without stretching or sagging, is necessary.

MINERAL entries of public land can only be made under the mining law; in homestead entry residence is compulsory; desert land entry costs $1.25 per acre—25 cents when entry is made, remainder when proof is made. There must also be an expenditure of $1 per acre per year for three years tending to the reclamation of the land.

THE California State Mining Bureau will, without charge, tell if certain metals or minerals are or are not in a sample submitted—that is, will make a qualitative analysis, but will not state in what quantity or proportion they exist in the proffered specimen. That department of the bureau answers about 1200 such questions annually.

DREDGING and drift mining are two forms of gold mining destined to be of great profit in California and elsewhere. The latter requires more capital and pluck than the former. Dredging offers about as near "a dead sure thing" as any form of mining can, where judgment is used in the selection of ground and in the mechanical appliances.

IT is with a patented claim as with any other real estate: optional with the owner whether it be utilized or allowed to lie idle year after year. Nor can any one other than the owner do any work or development thereon without his consent. Even the Federal Government parts with all power over it, and the patented property is subject only to State and local taxation.

IN the chlorination process an extraction of 98% is possible, if concentrates are very rich; but all depends on the character of the ore treated, as the tailings from some concentrates are high while others are correspondingly low; 90% or 92% extraction is very good on the average concentrates. As to the consumption of chemicals to the ton of ore, that also depends upon the character of the ore treated.

CARBOLITE is a by-product of iron making; it is a combination of carbon, calcium, aluminum and silicon, and from it is produced ethylene gas—a sort of improved acetylene, and produced at 50% less cost. For every ton of pig iron made, about 13,000 pounds of substance has gone to waste. Some of the slag has been used for ballast, cement and the manufacture of mineral wool; this latest product utilizes more of the former waste in iron manufacture.

IN a 12-foot piece of lumber, 4x4 inches at one end, 6x6 inches at the other, there are 25¼ feet b. m. To take the mean would give 25 feet; to take the contents top and bottom would give 26 feet. The accurate result is reached by assuming the stick extended to a perfect pyramid, then subtracting the top pyramid from the whole; the pyramid would be 36 feet long and would contain 36 feet; the lesser pyramid would be 24 feet long and would contain 10¾ feet; the difference is 25¼ feet.

A SOURCE of waste steam is leakage from the safety valves. Boilers need not blow off just at the working pressure. The safety valve may be adjusted to lift at five pounds above the working pressure—that is, if it is tight on its seat. A badly seated valve will blow off below the working pressure. Such a valve needs grinding in with fine emery powder. It is a lazy and dangerous practice to put a weight on the lever of a safety valve to prevent steam escaping. Grinding in is the only true remedy.

IN preparing white lead by electricity, a mixed solution of carbonate and chlorate of soda is subjected to the process of electrolysis; chlorate of lead is formed at the anode or lead plates by which the current enters the solution, and soda at the plates by which it leaves. The chlorate of lead forms, in contact with carbonate of soda, the hydro-carbonate of lead. The bath is agitated so as to keep it homogeneous and let the white lead fall to the bottom as it is formed. The soda is afterwards treated by a current of carbonic acid gas, which regenerates the carbonate of soda.

IN 1895 the Le Roi mine, Rossland, B. C., contracted to deliver 75,000 tons of ore to a smelter to be built at Trail, B. C., 11 miles from the mine. At the Trail smelter the freight and treatment cost $10 to $14 per ton; 95% of the assay value of the gold and silver was paid for, and 1.3% reduction made on account of copper. By the time the Trail contract was ended the Le Roi built a smelter at Northport, Wash., just across the line, where the cost of treatment is about $3 per ton. The C. P. R. R. acquired control of the Trail smelter, where freight and treatment charges now average about $7.50 per ton.

TO set borts in a diamond drill it is found by some experienced men that instead of setting the stones at regular distances in the face of the bit or crown that it is better to fix them in groups of twos or threes, leaving between the groups spaces of sufficient area to put in four plugs or pins of iron. These are firmly tamped in and left a shade long, so as to project a little beyond the exposed portions of the diamonds. The result of this is, that before the diamonds come into operation the iron plugs are gradually worn away until each diamond comes into work without undue prominence, and the risk of fracture when coming into contact with hard joint rock is obviated.

TO CLEAN MERCURY, many different ways have been repeatedly published herein. Probably in addition to what has already appeared anything good would not be new, and anything new might not be good. The following is recommended: Get a wooden half barrel or tub with faucet to draw off from the bottom; tilt at such an angle that the mercury put in may collect around the faucet; get a pound of per-chloride of iron (in lump, not in solution). The tub being half full of warm water, put in two lumps of the per-chloride, the size of walnuts, which should suffice for half a flask of mercury. Pour in the mercury and stir in the solution for six or eight minutes; let it stay twelve hours, giving it an occasional stirring. The mercury is to be drawn off as needed. The solution should clean the mercury without affecting it otherwise. An occasional little chunk of the per-chloride will keep the solution sufficiently strong. When it gets thick and foul it should be cleaned out and renewed.

WITH the development of larger and more efficient dynamos the effort has been to establish central power stations for transmitting energy electrically over large territories. This system has attained its highest development in the harnessing of natural cataracts. In speaking of electric energy the engineer thinks of two things: First, amount of electricity flowing through the wire; second, the force with which it is being driven along. This force is known as voltage, electricity flowing as the current; thus a certain current is transmitted at so many volts. By experiment it is known that the main loss of energy is due to heat radiation from the transmission lines and that this heat varies directly as the resistance offered to the current and as the square of the value of the current. From this it is seen that if only a small amount of current is conducted the per cent of loss is much reduced; the problem is, then, to transmit the electric energy in the form of a small current and at the same time provide for the development of a large amount of power where it is to be utilized. To do this the practice is to generate an electric current at a moderate voltage and, by means of suitable apparatus, convert it into a small current at high voltage. This high voltage current is transmitted to the point of utilization where the electric energy undergoes a reverse transformation which brings it to its original condition and to one better adapted to the propelling of machinery. The use of a small current at high voltage is analogous to that of a small water pipe conveying water under high pressure. Suppose two pipes varying widely in diameter to conduct water from "a" to "b." To transmit the same volume of water by each in the same time the water in the small pipe must evidently have a much greater pressure, or rather velocity. These two pipes may be made to fill two equal reservoirs in the same time and thus each made to do the same work. Just so in the case of electric transmission; the same power can be conveyed either by a large current at low voltage or by a low current at high voltage, but as the heating is much less in the latter case it is the method that is commonly used—in fact, it has rendered the long distance transmission of electric energy possible.

THE automatic compression of air by a column of water flowing down a shaft, referred to on page 547 of the issue of May 19, is a device for obtaining compressed air by the direct act of falling without the aid of any moving mechanism and depends upon the principle of the Sprengel pump. If a stream of water or any other liquid is allowed to fall down a vertical tube, into which air is also suitably admitted, each drop of the falling fluid will entangle and carry down with it a globule of air, the drops of the liquid forming pistons, so to speak, in the tube, which force down and compress the air. Its typical form is that of the trompe, the blowing machine used in the old extinct Catalan forge, which is said to have been invented in Italy as far back as the year 1640, but in these somewhat primitive forms the blast pressure was always low and the efficiency did not exceed 15%. The compressor referred to in the answer to the Redding, Cal., correspondent in the issue of May 19, consists essentially of a head tank, a vertical down-flow pipe, and separating tank placed at the base of the down-flow pipe. The water may be conveyed to the head tank by means of an open flume, or pipe; water entering the down-flow pipe passes the ends of a number of small air pipes, from which air is drawn in the form of small uniform globules, which, becoming entangled in the descending water, are carried down to the air tank, where separation takes place, the air rising to the top of the tank, and the water flowing out at the bottom, and up again outside the down-flow pipe to the tail race. The difference in height of the tail race and pipe to head tank gives the available head of water. The globules of air are uniformly compressed at constant temperature during their downward path, the temperature of the water remaining practically constant. The amount of compression of the air depends solely on the length of the down-flow pipe, being independent of available water fall. In the case of the machine erected at Magog, Quebec, the depth of the shaft is 128 feet, its size 6x10 feet; the down-flow pipe is 3 feet 8 inches in diameter; the inverted tank at the bottom of the shaft is 17x12 feet. The penstock, or inflow pipe, is 5 feet 6 inches in diameter, and in the headpiece there are thirty air pipes, each 2 inches in diameter, and each having thirty-two air inlets at their base, making a total of 960 air inlets. Through these the air mixes with the down-flowing water, thus subdividing the air into an innumerable number of small bubbles. The available working water head is 21 feet. Tests made by Mr. McLeod, of McGill University, indicated that the plant gave an efficiency of 60% of the actual H. P. of the water in dry cold air.

The Cripple Creek Volcano.[*]

The Cripple Creek district occupies a cluster of foothills on the south side of Pike's Peak, Colo. It is essentially a small volcanic area, of about 20 square miles, amid the granite of the Front range. The mines are situated amid a volcanic complex, consisting of tuffs and breccias, which have been penetrated by an extensive system of dykes and other intrusive masses. The prevailing formation is an andesite breccia, which lies upon the worn surface of the granite and fills the deep basin around a volcanic vent. The breccia, since its deposition, has been broken into by several eruptions of phonolite, and, later still, by a series of thin dykes of basalt and other allied rocks of a highly basic composition.

The Cripple Creek district represents the ground floor of a volcano, the superstructure of which has been removed by erosion.

At Cripple Creek the mine workings afford a good deal of information concerning the underground structure of the region. It is hoped that an inquiry into the history of the volcano which determined the interesting character of the district will contribute toward a clearer comprehension of the geology of the mines.

The operations of nature in the past are inferred from the observation of those which take place today. The intensity may vary; the forces are the same. This is the cornerstone of modern geology as laid down by Lyell. The volcanic complex at Cripple Creek is to be understood in the light of the evidence gathered for us by the patient investigators who have stood by the side of the craters of Stromboli, Vesuvius and Kilauea.

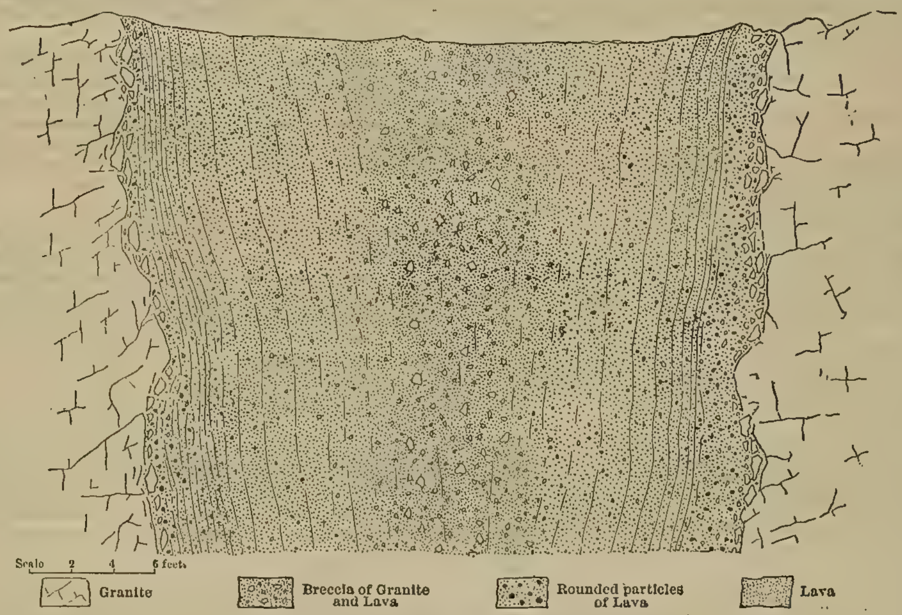
The conclusions of those who have made a specialty of this branch of geology may be summarized thus: The explosive violence of volcanic eruptions is due to the access of water to the fused rock within the conduit of the volcano; but, as it appears that this water is not contained within the substance of the lava emitted during the tranquil emissions succeeding the first paroxysmal outburst, it is inferred that the water is not the primary cause of volcanic action, which originates at a depth greater than that to which it is believed that water can penetrate. The evidence collected is not complete; but it warrants a reasonable conjecture that volcanoes owe their origin to the contraction, caused by the cooling of the earth's crust upon a yielding substratum, separating the solid outermost shell from an equally solid nucleus. While, therefore, the force which pushes large quantities of fused rock to the exterior of the earth has, probably, a deep-seated origin, nevertheless, the immediate cause of the uncertainty, the violence and the magnificent energy of volcanic action is traceable to the effects produced by water coming into contact with the lava as it approaches the surface.

The volcanic rocks of the Cripple Creek district have come up through the granite. It underlies them all; they rest upon it, and can be seen penetrating it in the form of dykes. Previous to the first eruption, the granite must have presented a weatherworn surface, such as characterizes the high hills. Ever since its first emergence from the ocean this region has been undergoing an intermittent elevatory movement, which culminated in making the Front range. Erosion had been continuous, but the uplift more than counterbalanced such wearing away; and the granite hills had been slowly raised far above the Cretaceous seas which washed their edges in the era preceding that to which the eruption is assigned. The forces which had done this work were of the most patient kind; their manifestation had about it nothing of a violent or paroxysmal character; time was an essential element of the process.

At the close of the Eocene period this apparent equilibrium was disturbed. The foundations of the granite hills trembled. Slight tremors were followed by earthquakes, and these were the precursors of greater violence.

There is ample evidence that water does not penetrate into the conduit of the volcano, and that it is originally derived from the surface. As against the contrary belief, namely, that the water vapor accompanying eruptions is an essential constituent of the lava, and, therefore, shares with it a deep-seated origin, there is the following evidence: It has been found, as the result of a large number of accurate observations in wells, shafts and boreholes, that the temperature underground increases 1° F. for every 48 feet of descent. At 7776 feet, the boiling point, and at 34,700 feet, the critical point, 773° F. of water would be reached. The expansive force of steam increases rapidly with the temperature, so that at 773° F. it would be equal to the pressure of 350 atmospheres. This is termed the "critical point" because at this temperature water, however great the pressure to which it is subjected, can no longer exist as a liquid, but becomes dissociated into its constituent gases. Although the exact conditions which obtain at these great depths can not be known with certainty, nevertheless, all the evidence goes to show that there is a limit set to the descent of surface water by the rapid increase in the expansive force of its vapor, due to the rising temperature. Prestwich put the maximum limit at 6 to 7 miles, and Delesse estimated it at 60,000 feet, or about 11 miles. Moreover, experience goes to show that the water encountered in mines is the drainage from the surface. Deep mines are usually dry ones. I may instance the deepest metal mines, the Calumet-Hecla and Tamarack, in the Lake Superior region, and the 180, New Chum-Victoria and neighboring shafts, at Bendigo, in Australia.

The evidence obtainable concerning the first eruption of the Cripple Creek volcano is necessarily very meager. The first vent must have been formed at some point along one of the fractures caused by the earthquake shocks; the lava, in forcing for itself a way to the surface, being aided by the force of the expanding steam. The pressure required to break a passage through the overlying rocks is stupendous; and, as a consequence, when the steam accompanying the lava is finally and very suddenly released from that pressure on its immediate arrival at the surface, it escapes with explosive energy and with projectile discharges which may reach to an astonishing height. Thus, when the outburst of Krakatoa, an island near Java, occurred in 1883, the finer fragments ascended skyward 10 miles and were recognized in the atmosphere of London. The winds carried the dust of Krakatoa around the world, and thus gave rise to the extraordinary sunsets observed in the autumn following.



MINING AND SCIENTIFIC PRESS

VOLCANIC VENT IN GRANITE, AT VICTOR, CRIPPLE CREEK.

FIG. 1.

The Cripple Creek volcano first ejected fragments of granite. They were probably small in size, and became further reduced by colliding with each other as they were discharged, so that they fell to earth in showers of particles like gravel. Of this first eruption there is little trace now, unless the grits of Straub and Grouse mountains be the remnants, as is probable, of the debris accumulated at that time. Material resembling this must certainly have covered the surface around the vent, until the larger portion of it was washed away. The steam, which in enormous volumes accompanies the first outbursts of volcanic action, becomes condensed as soon as it issues into the cold air and forms rain clouds, the downpourings of which frequently removes the accumulations formed at the initial stage of the volcano. The floods which succeed eruptions are due to the supersaturation of the atmosphere with the water vapor emitted by the volcano. Such floods are more feared by the dwellers around Vesuvius, for example, than the lava streams, the destructive effects of which are comparatively restricted. It was the formation of a liquid mud, by the action of heavy rains on the fine material, called tufa, which buried the city of Herculaneum.

It is unlikely that sufficient data will ever be forthcoming to give an exact presentation of the chief vent of the Cripple Creek volcano, unless one of the millionaires, enriched by the gold he has won from the mines, shall undertake the requisite explorations. Yet some very interesting information on this point is available. A miniature vent exists near the town of Victor, and the railroad has cut through it, so as to furnish the section of it shown in Fig. 1. As a hand specimen may exemplify the structure of a mountain range, so this small vent typifies many of the characteristics of the orifice probably existing in the earlier stages of the Cripple Creek volcano.

This vent occurs in the massive granite of Squaw mountain, about 1700 feet south of the main breccia formation of Battle mountain. In the railroad cut, where it is to be seen, it has a width of 35 feet. It is filled with fragments of granite and the gravel derived from the brecciation of granite. The edges are not particularly well defined, because the face of the enclosing rock is shattered. The most peculiar feature of the section is presented by pellets, nodules and rounded fragments of dark-red scoriaceous lava, which occur all through the material filling the vent. At the edges rounded inclusions of this lava can be seen in the mass of fragmentary granite; and in the center the lava, by reason of oxidation, forms a red granular matrix, in which large pieces of granite are separately discernible. The material, especially near the edges, has a laminated structure, parallel to the sides of the vent. These laminations vary in thickness according to the coarseness of the material.

This illustration is of great interest. The vent is in granite, as was the first vent of the volcano. It is now filled with breccia, as at one time that was. The shattering of the sides is suggestive of the mode of formation of the breccia, which now fills it. Had this vent been further enlarged, and subsequently penetrated by phonolite, not in fragments, forming a breccia, but in liquid form, solidifying to a compact mass, it would have presented a complete anology to the Cripple Creek volcano.

After the first outburst, a change took place in the matter ejected by the Cripple Creek volcano; there began to appear the fragmentary andesite which was destined to be accumulated to such an enormous thickness. It may be that flows of andesitic lava also welled out over the surface at this time. If so, they were subsequently eroded. During the long intervals of quiet separating one period of eruption from another, the lava became cooled, cracked, and then disintegrated by rain and frost, so as to be broken up and carried away by the mountain streams so as to form a part of the alluvium of the valleys. Thus the superficial flows were removed; but the corresponding bodies of lava which consolidated underground when the extrusion at the surface had ceased, are now, thanks to that very erosion, to be seen as bodies of andesite rock in several parts of the district, notably on the eastern side of Battle mountain and near Legal Tender hill, above Goldfield.

At this period similar outbursts were occurring among the neighboring hills, for the Cripple Creek volcano was but a minor incident among the eruptions which during the Tertiary epoch spread a vast thickness of breccia and lava over a large portion of southern Colorado. Out of the products of these eruptions were sculptured the serrated peaks of the Uncompahgre, the Cleopatra hills and the rugged ranges of the San Juan.

After the eruption had continued sufficiently long to form a vast accumulation of the fragmentary materials, which in process of time became consolidated into breccia, there came a period of comparative quiet.

(TO BE CONTINUED.)

Two slow but interesting changes are taking place in Behring sea. The immense quantity of debris that is borne down the Yukon from its sources and sides is being deposited in the sea beyond the mouth of that mighty stream, and its weight causes the bed of the sea to subside. A corresponding rise in the earth's crust is going on along the chain of the Aleutian islands. Not only are the islands themselves increasing in size in consequence of being lifted up out of the water, but new islands are being formed in the gaps between the others. In some instances the new islands are the result of the rise, and in others they are the result of volcanic action. Most of the Aleutians are of volcanic origin, and they mark the position of a fold in the earth's crust that is predisposed to eruption. In time there is likely to be a natural bridge from America to Asia along this route, but nobody now living is going to see it.

---

[*] Condensed from a paper read at the Washington meeting of the A. I. M. E. by T. A. RICKARD.

The Factors in Concentration.[*]

On attempting to segregate the factors in concentration into various groups they are found to vary regularly from purely commercial at one end to purely technical at the other.

Those from the extremities of a comparative list can be readily grouped, but the greater portion have their commercial and technical aspects so related that nothing is to be gained by attempting to consider them separately. Profits—the commercial aspect—mean that returns minus costs must have a positive value. The word "returns" is used to stand for the sum of all commercial values in the concentrates. The costs are made up of concentration, transportation of concentrates to point of sale and refining.

Considering the totals of any given proposition, the general law is that the greater the concentration the greater the loss of values; that is, the smaller the weight of material delivered for sale at point of refining the smaller would be the amount of values delivered for any given tonnage treated by concentration. The two practical limiting cases are:

First.—Where no concentration takes place and all the values are delivered, the cost of concentration being zero and transportation and refining each a maximum.

Second.—Where pure values are produced and the minimum amount delivered, the cost of concentration being a maximum, the cost of transportation being a minimum, and the refining cost reducing to zero.

This statement of the minimum limiting case exhibits the marked peculiarity in the form of the function expressing this general law, which, in definite concentrating problems, very greatly reduces the limits between which a solution need be sought. That is, the degree of concentration does not approach infinity as a maximum, but a definite value which is usually sharply determined by the existing mineralogical and industrial conditions. To the stamp mill man the definite demarcation between the specific gravity of the pyrites carrying his concentration values, and the accompanying silica or silicates, clearly indicates the minimum limit of his concentrating problem. In these same concentrates later the matte smelter finds as definite a minimum limit for his problem in the equally marked differentiation of the copper contents.

Yet, while both theoretically and in a general way these limits are well marked, in practice there is a marginal zone within which the more profitable course of operation is not evident from inspection. This is caused by:

First.—The fact that the influence of factors other than the specific gravity (such as surface tension, etc.) is modified by the character of the crushing that preceded the concentrating; and

Second.—By the fact that no practical limit of crushing will entirely release the materials whose separation is sought. Thus, instead of there being a sharp margin up against which concentration can be carried, even in cases where the difference in specific gravity is marked, the limit is made indefinite by the presence of particles, mechanical mixtures of varying proportions with specific gravities varying over the entire available difference. Within the marginal zone occur the problems of concentration, the solution of which is not a matter of off-hand professional experience, or of accumulated constants and data, but of comprehensive testing.

General experience (plus constants and data) will be of value in regard to the limits of this zone, and in the cases outside of it can, giving the transportation and refining factors, furnish a solution, both in regard to total investment and details of plant. Such a case would be the small concentrating plant usually placed below a stamp mill, or, in general, any proposition where on account of high transportation and refining charges the margin between smelting and concentrating ore is large.

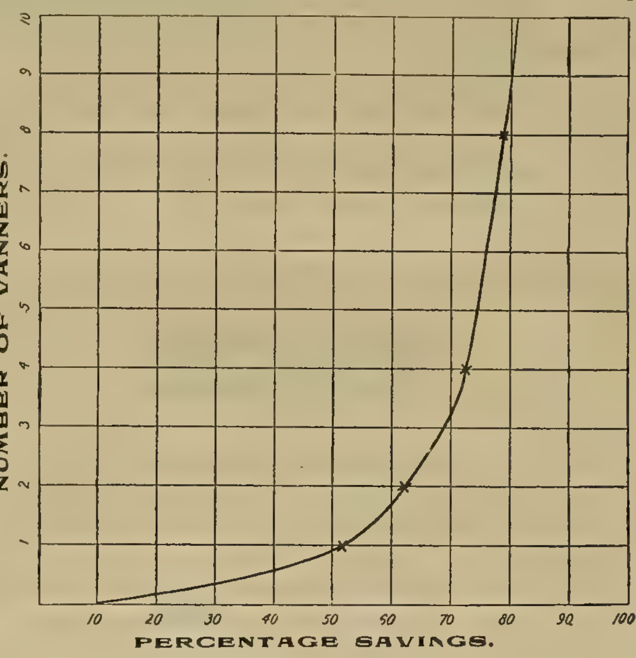
In such cases the criterion is the law of operation, that the saving will be higher the greater the investment per unit of ore handled. That is, the saving will increase with the investment and decrease with an increase of tonnage for any given investment. At the same time with increased investment comes increased cost as well as increased saving.

But while both the saving and cost of operation increase with the investment per unit of ore handled, the ratio of each to the investment is not constant, nor do they vary according to similar functions. Starting from the intermediate point where both cost of operation and investment are zero, the ratio of increase of cost of operation to increase of investment rapidly falls from that found in small, under-capitalized plants to a value near, but slowly approaching unity. A closer analysis of this function shows that it is the sum of two co-operating effects, one due to investment in actual concentrating machinery, which adds in a direct proportion to the cost of operation, and the other, the investment in handling the machinery, to the effect of which can be traced all the variating in the ratio. Within the practical limits between which any given concentration problem must be solved, this change in ratio may be neglected. (A 200-ton concentrator may be run with a lower cost per ton than one of fifty tons, but the fact is of no use when only fifty tons of ore are available.) In other words, if the investment per ton handled be doubled, the cost per ton will also be doubled.

Consider the simple case of a concentrating machine at work: Will it pay to split its load over two machines? If the saving increased proportionate to the investment it obviously would pay; but it is equally obvious that the saving can not increase in this way, for, no matter how large the investment, no more values can be taken from ore than it contains. That is, while the investment varies from zero to infinity the saving varies from zero to unity.

With any given set of conditions, values, freight rates, smelter charges, depreciation, interest, labor costs, for some given investment, the ratio of returns to costs must reach a maximum, this being a matter of comparatively simple mathematics to formulate. The difficulty at present lies in the fact that almost no work has been done towards determining the constants of such a formula, these constants having to be determined for each type of concentrating machinery. Some tentative testing with vanners under the necessary conditions of uniform surroundings showed that the ratio of investment to saving could be expressed closely enough by using three terms of the general conic equation, differentiating for the maximum value. But the desirability of using more than three values in the determination of the constants and the reduction of the constants so obtained to a single most probable formula by the method of least squares, makes the work, while simple, so tedious that the graphic method of plotting a curve has been found much the more suitable for general practice.

The accompanying curve plotted from the following values experimentally determined from 6-foot side-shake vanners illustrates the method:



Number of machines.	Percentages savings.	Loss.
1	51	49
2	62	38
4	72	29
8	79	21

Necessarily the curve proved asymptotic to the percentage value 100.

Applying the case of the single concentrating machine, with assumed conditions:

Values of concentrates in each ton of ore	$ 6
Tons handled per day	10
Ratio concentration with one machine	10
Cost of operating each machine per day, including depreciation and interest	1
Smelter charges and freight on concentrates	10

With one machine the net result is:

$$\text{Returns} = \frac{10 \times 6 \times 50}{100} = 30$$

$$\text{Costs} = \frac{10 \times 10 + 1}{10} = 10.1$$

$$\text{Returns—Costs} = 30 - 10.1 = 19.9$$

With two machines the net result is:

$$\text{Returns} = \frac{10 \times 6 \times 62}{100} = 37.2$$

$$\text{Costs} = \frac{10 \times 62 \times 10 + 2}{10 \times 50} = 12.4 + 2 = 14.4$$

$$\text{Returns—Costs} = 37.2 - 14.4 = 22.8$$

That is, under the conditions enumerated there would be a distinct gain in doubling the investment. Applying it to eight machines:

$$\text{Returns} = \frac{10 \times 6 \times 79}{100} = 47.4$$

$$\text{Costs} = \frac{10 \times 79 \times 10}{10 \times 50} + 16 = 15.8 + 16 = 3.18$$

$$\text{Returns—Costs} = 47.4 - 31.8 = 15.6$$

That is, with eight times the investment the net return is less than with one machine, although the amount of values shipped is greater.

By selecting various points on the curve the net result for various numbers of machines can be ascertained until the most profitable one under assumed conditions is determined.

This method as outlined is capable of ready application to the average concentrating problem. Given the data from which to plot the curve, the other factors will usually be found fixed.

To obtain the curve data it is not necessary to have available a varied number of machines, but the same results can be even more readily obtained from one machine by varying the amount of pulp handled. It should be noted that in such testing results obtained by hand panning of heads and tails are unreliable. The better plan is by analysis; in the common case of sulphides, analyzing for sulphur and in other cases for the constituent element that accompanies the concentrating values. As with the average concentrating machine the differentiation of gold is only incidental to the gold accompanying some more abundant material, assays are misleading in questions of relative saving. Further, in recording such tests that they may be of general value, the actual size of the maximum sized particles experimented with should be stated in millimeter and not in the indefinite phraseology of "mesh."

In cases where the proportion of concentrates is less than 5%, the variation due to a change in the concentration ratio can be neglected.

The question of crushing, while a definite factor in concentration, is usually so limited in range by the mineralogic and physical features of the ore as to render it practically as fixed a quantity in any concentrating problem as the smelter charges on the product.

But while the size of the product to be concentrated is presented in, is thus definite for a given case, it exercises a controlling influence on another factor in concentration—the type of concentrating machines to be used. In general, all practical machines make use of the varying ratio of the surface friction in some medium to the weight of the particle; in most, agitation being used to overcome the difference between the friction of motion and the friction of rest. The classification of a charge of particles being so effected, to render the process continuous requires that the classified particles be removed from the machine without admixture. From the method used to accomplish this, concentrating machines may be grouped in three types: those that discharge the concentrates through the bed they have settled on—such as the jig; those that shake the concentrates off of one edge of the bed—such as the modern stratifying tables—and those that remove the bed with its accumulated load of concentrates—such as the buddle and the various forms of vanners.

The differentiation of these types results from the fact that in the ratio, on which concentration depends, that of weight of particle to surface friction in some medium, this factor of surface friction is the resultant of two factors, the form of whose function differs so much as to make them practically independent variables. One is the friction of the liquid medium on the particle; the other is the friction between the particles and the surface that supports it. In the hydraulic classifier theoretically this factor is zero. In the jig is a minimum, greater in the shaking tables and is a maximum in the moving bed type of concentrators. Its proportionate influence on the total factor of surface friction is a function of the lineal dimensions of the particle, the influence being a maximum for the minimum sized particle and at a minimum with the larger sized particles.

A concentrating machine can be expected to do the best work when the ratio of these two factors of friction against fluid medium and friction against supporting surface, as used in its operation, compares most closely with the ratio of the influence of each on the mass of the given particle.

It should be noted that while the form of the function expressing this ratio remains the same for different materials, the constants in the function change. That is, with a given material to concentrate, such as galena, a certain-sized particle will always call for a certain type of machinery, while the same size of particle would probably require a somewhat different type of machine in the case of a different material, such as barytes. For most of the common mineral mixtures the best type of machine for a given size particle has been settled by the empirical experimentation of centuries and is recorded in the design of profitable plants in concentrating districts throughout the world.

Machines of a given type may differ in their mechanical arrangements for carrying out their typical work, but this difference should not be confused with the metallurgical difference of type. The fact that there are no sharp limits between which any type of machine must be used, the efficiency simply running down as it is used with other than its most efficient size of particle, has helped to confuse the distinction between mechanical and metallurgical adaptability, usually at the expense of the latter.

---

[*] By MR. F. T. SNYDER at the March, 1900, meeting of the Canadian Mining Institute.

While the voluminous experience in concentration has broadly settled the relation of type of machine to ore particle, there is great desirability for comprehensive testing over the limiting margins of each type; with the jig, from one-fifth millimeter down; with the stratifying machine, from 1-20 millimeter down, and with vanners up towards two and three millimeters. Here, when the usefulness of these machines overlap, the difference in adaptability is too small to be decided by inspection and awaits systematic recording.

SUMMARIZING.—Each concentration problem must be solved twice; first, backwards from general factors to details; then forward with settled details to a definite general result.

Starting with the general transportation and refining factors, the limits are found between which concentration is possible at any geographical point. Next, the physical conditions of the problem under consideration determine the types of crushing and concentration machinery and capacity of plant.

Lastly, the values in the ore determine the investment; that is the number of machines of each type to be used per ton capacity to be desired. Then with these definite quantities applied to the general factors, the solution is retraced and a definite showing decides whether the return minus the costs will have a positive value.

There is to-day no risk in concentrating investments, aside from inefficient business management.

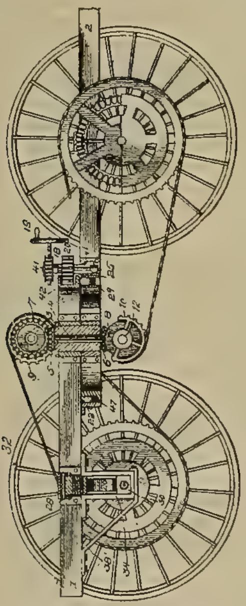
◆

Mining and Metallurgical Patents.

Patents Issued July 3, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

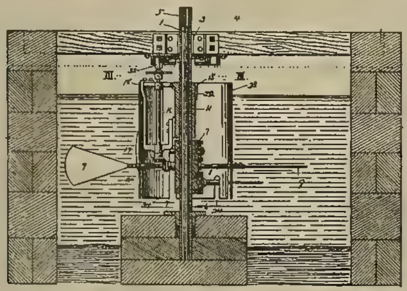
TRACTION ENGINE.—No. 652,648; F. Sommer, New York, N. Y.



A vehicle motor frame, composed of two parts joined together by pivotal connection, each having attached thereto semicircular piece, in combination with antifriction wheels or rollers, the frame 1 having supporting brace piece 31^a provided with opening for king bolt, in combination with king bolt having central opening, frame pieces 1 and 2, having brace pieces 31^a and 31^b and centrally bored king bolt or pin 3, passing through openings in brace pieces, axle and axle boxes and upright spring bearing on boxes, in combination with frame of vehicle bearing on spring.

◆

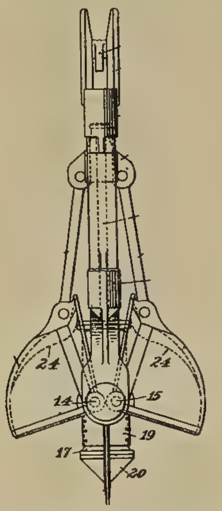
WATER WHEEL.—No. 652,774; W. T. Hoffman, Kansas City, Mo.



Combination of vertical rotating shaft, horizontal rotating blade-shafts mounted on vertical shaft, spider on vertical shaft having horizontally-extending legs, series of short vertical shafts mounted in bearings in legs and geared to blade-shafts, star-wheels on short shafts, above legs, vertical projections from frame for actuating star-wheels, angular blocks fixed on star-wheel shafts above star-wheels, and curved guide-flanges on stationary frame, above wheels, adapted to receive blocks, flanges having openings or breaks to permit blocks to rotate simultaneously with wheels.

◆

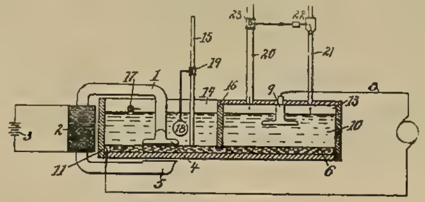
DREDGER BUCKET.—No. 652,738; W. H. Arnold, New York, N. Y.



Combination with dredging bucket having slot in upper end chains or cables by which bucket is suspended, equalizing-bar to ends of which chains or cables are attached, bar pivoted at its middle in slot and protected throughout its extent by walls of slot. Combination with frame and anchoring-blade of shells or scoops hinged to frame and having outer surface concentric with axis of hinge and inner surfaces eccentric thereto whereby scoops are thicker near rim and tend to enter deeper into material to be scooped up.

◆

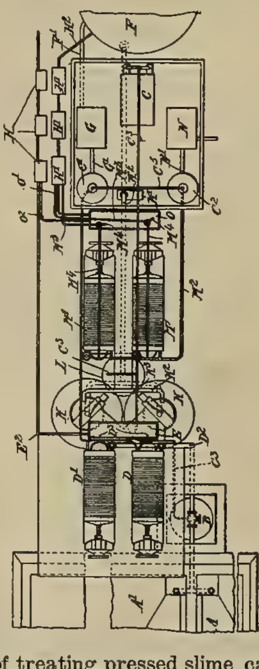
ELECTROLYTIC PRODUCTION OF CAUSTIC SODA.—No. 652,761; J. B. Entz, Philadelphia, Pa., assignor to American Alkali Co., New Jersey.



A process which consists in passing a current through mercury, electrolyzing superposed fluid to effect deposition on mercury, and subjecting mercury to influence of magnetic field to cause it to move and transfer the substance deposited.

◆

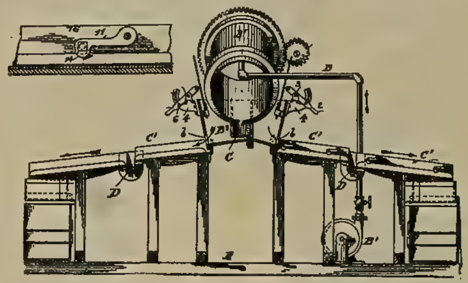
PROCESS OF EXTRACTING METALS FROM ORES OR SLIMES.—No. 652,849; S. H. Johnson and H. L. Sulman, London, England.



A method of treating pressed slime cakes containing residual water, which consists in displacing residual water with an equal volume of solvent solution, mixing cakes with further quantity of solvent solution, removing metal-bearing solvent solution by pressure, displacing remaining portion of such metal-bearing solution with water, and extracting metal from metal-bearing solution, whereby all operations may be performed with an approximately constant volume of solvent solution.

◆

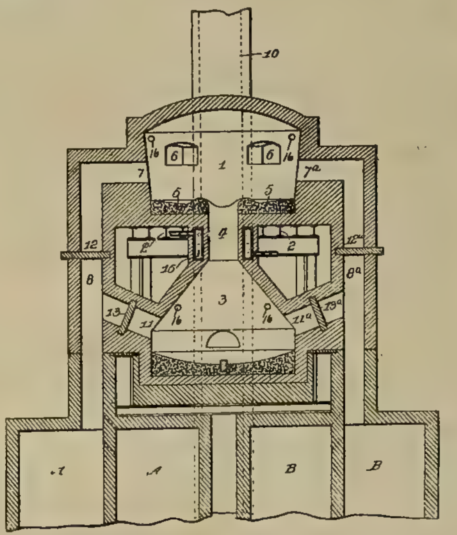
GOLD SAVING APPARATUS.—No. 652,900; R. H. Postlethwaite, San Francisco, Cal., assignor to the Risdon Iron & Locomotive Works, same place.



In gold saving apparatus combination of rotary open grizzly, distributing box arranged longitudinally beneath grizzly and adapted to receive material from different parts of latter, inclined perforated distributing trough arranged between upper portion of grizzly and box, series of escape openings formed along longitudinal sides of distributing box, gates for openings, and inclined tables or platforms arranged at sides of distributing box adapted to receive material escaping from openings; combination of series of parallel troughs or channels located side by side so as to form distinct runways for the material from which gold is to be extracted, blanket or layer of fibrous material located in each trough or runway, layer of perforated expanding material having roughened upper face placed over blanket or layer of fibrous material, rods or strips for holding layers in position, lock cams fulcrumed to flanges of troughs or channels, which cams hold rods or strips firmly in place.

◆

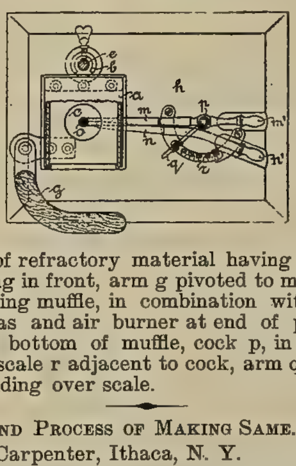
METALLURGICAL FURNACE.—No. 652,968; E. Kerr, Pittsburg, Pa.



Metallurgical furnace having in combination melting chamber, crucible arranged below melting chamber, opening or passage connecting crucible and melting chamber for passage of products of combustion and molten metal into crucible, ports or openings on opposite sides of melting chamber for admission of heating gases, valves controlling ports or openings, ports or openings on opposite sides of crucible, valves controlling flow of gases from crucible.

◆

PORTABLE MELTING APPARATUS.—No. 653,007; N. S. Jenkins, Dresden, Germany.



Muffle a of refractory material having hole in bottom, opening in front, arm g pivoted to muffle, rod e for supporting muffle, in combination with pipes m and n for gas and air burner at end of pipes below opening in bottom of muffle, cock p, in gaspipe m, graduated scale r adjacent to cock, arm q secured to cock, extending over scale.

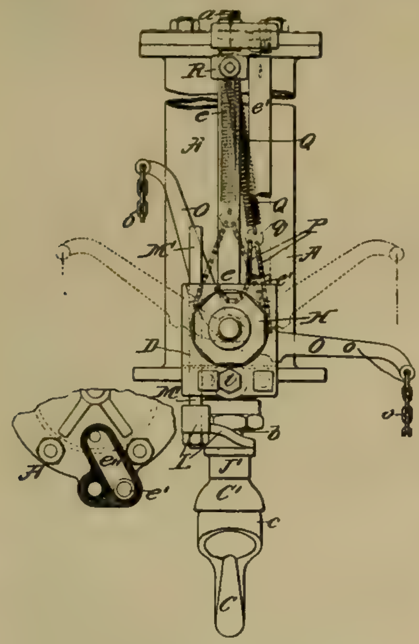
◆

ALLOY AND PROCESS OF MAKING SAME.—No. 652,833; R. C. Carpenter, Ithaca, N. Y.

An alloy of aluminum, zinc and tin combined in the proportion of fifty parts aluminum to twenty-five parts tin and twenty-five parts zinc; the process consists in first fusing aluminum, then adding thereto tin in quantity less than that of aluminum, lowering temperature of molten mass, then adding zinc in quantity less than that of aluminum.

◆

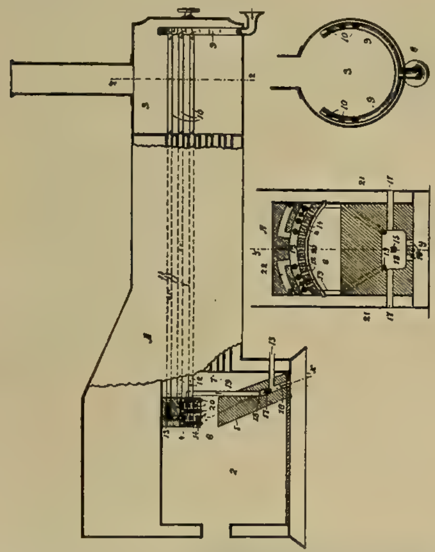
AIR HOIST.—No. 652,983; G. F. Steedman, St. Louis, Mo.



Combination with valve casing formed with pressure duct d, exhaust passage d′, cylinder port d″, of disk valve co-operating with cylinder port to open same to pressure from valve chamber, valve being provided with passage f″, for registry with cylinder port, a valve stem or spindle formed with passage g, in constant register with passages d′ and f′, and means connected to spindle for rotating valve; to admit or exhaust pressure to and from cylinder to compensate for increase or decrease in load carried by piston, means comprising lever O arranged on valve stem, link N connected to lever, rod M to which other end of link is connected, arm L on rod M, collar J on piston rod, with which collar arm L engages, binding screw k in collar, handle K on binding screw.

◆

FUEL ECONOMIZER.—No. 652,895; J. H. Hobart, El Paso, Tex., assignor of one-half to E. R. Phillips, same place.



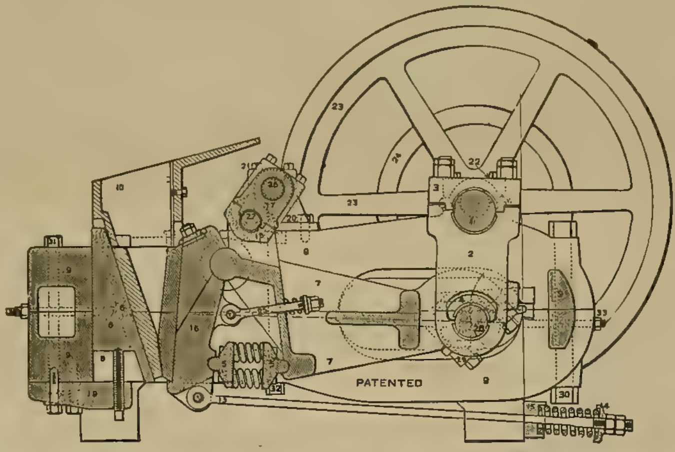
Combination of boiler and firebox thereof, arch fitted in upper part of firebox having an internal chamber, wall built up from lower part of firebox and forming heat passage between itself and arch above, passages made in wall and connections therewith from firebox, means connecting passages with chamber of arch and means connecting chamber with heat passage between arch and wall, openings in bottom of arch whereby air is delivered into intermediate heat passage.

◆

A THREE-CANDLE-POWER incandescent lamp is announced by T. A. Edison, the use of which, it is claimed, will prevent colliery disasters. The law governing the inspection of mines in Pennsylvania makes it mandatory that the lighting thereof, whether portable or stationary, shall have the approval of the chief of the inspectors, for on his judgment and intelligence is supposed to depend the safety of thousands of lives and millions of dollars in property. Application has been made to J. E. Roderick, chief of the bureau of mines in Pennsylvania, to order the use of the Edison system in place of the oil and gasoline lamps. The invention is a primary battery, in which the pots, carbons and all connections are fixed. It is claimed that a box weighing 4½ pounds will maintain a three-candle-power lamp for ten hours at a cost of 2 cents. A bevel-plate glass covers the lamp. Should this glass be broken by accident or design, the light is extinguished. No heat is evolved, and it is impossible to ignite either vapor or substance. From 1887 to 1896 the number of miners who lost their lives in the United States through accident was 8140, and fire damp was responsible for a large number of them.

Sturtevant Roll Jaw Crusher.

Crushing is the first and least expensive step in rock reduction, as any standard breaker will reduce the hardest ores at a minimum cost. Well-managed works seek to do as fine work as possible in the crushers. With intent to supply this requirement without tendency to clog, the Sturtevant roll jaw crusher, whose jaws can be set without danger of clogging to ¼ inch, has been designed. Its moving jaw does not approach and recede, but rolls opposite the fixed jaw, rolling over the rock to be crushed, which drops out after the rolling jaw has passed over it. Thus it is free to drop out, and only really sticky ores clog. The Sturtevant roll jaw crusher, herewith illustrated, is of the true jaw and toggle type, designed to be durable and effective for hard rocks, and it is claimed by its manufacturers that its unusual power, due to long leverages, makes it an easier running machine, rock breaks easily when rolling, and biting pressures are applied at the same time. In this the rock is reduced by rolling stresses without any rubbing action, promoting durability. The cut illustrates a 5x24 roll jaw crusher, weighing about 22,000 pounds and requiring about 15 H. P.

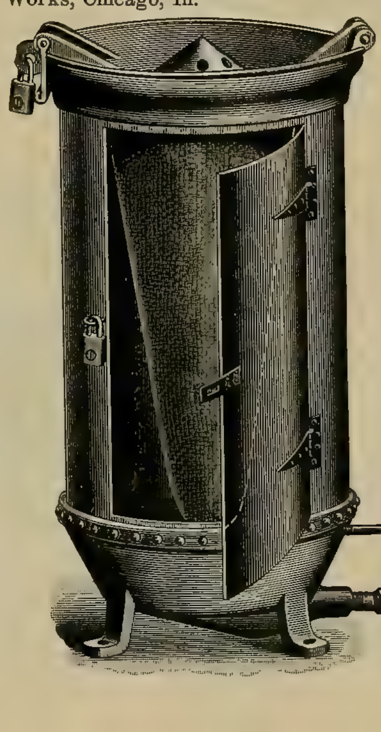


When the faces of the roll jaw crusher are set to ¼-inch, they take in as large rocks as a breaker of equal size, reducing them at once to gravel and sand, suitable for mills or finishing rolls, thus designed to do the work at one operation. They can also be set to do the common coarse breaking.

The Sturtevant roll jaw crusher is designed to last and to give the least possible trouble; its jaws are of steel and the toggles for all hard work of bronze. It is made by the Sturtevant Mill Co., Boston, Mass.

Clean-Up Pan and Amalgam Safe.

Herewith are depicted a convenient form of clean-up pan for cleaning up the scrapings from mortars and plates, and an amalgam safe, provided with canvas filter bag to draw off quicksilver excess at the bottom, provided with lock to insure safety. These devices as portrayed are furnished by the Gates Iron Works, Chicago, Ill.



Born Before the Flood.

A cedar tree, whose age has been reckoned by geologists at 25,000 years, has been found in California, standing in an excellent preserved state, the fibers so perfect and the wood so strong that it was used for timbering in the construction of a mining tunnel. This remarkable instance of the preservation of organic remains was found in the heart of a mountain, nearly 500 feet below the summit. This mountain is a spur of the Sierra Nevadas, near the Forest Hill divide, in Placer county, between the north and middle forks of the American river.

The mountain is lava-capped with one of those singular table tops which show that there was once a day when all those ravines with which the region now abounds did not exist, and that what is now the crest of the mountain was once the lowest plane in a topography vastly different from that which exists today. For all of these millions of tons of lava material were incumbent upon a river bed, and it was on a bank of this river that this cedar tree grew, and here it was found standing, 100 feet in height, 25,000 years after its submergence. The lapse of time since it was thus sealed to the world can not be more than approximated. It is known that its inundation occurred during the Pliocene period and that this was a Pliocene tree; the geologists of California estimate that the Pliocene period ended about 25,000 years ago.

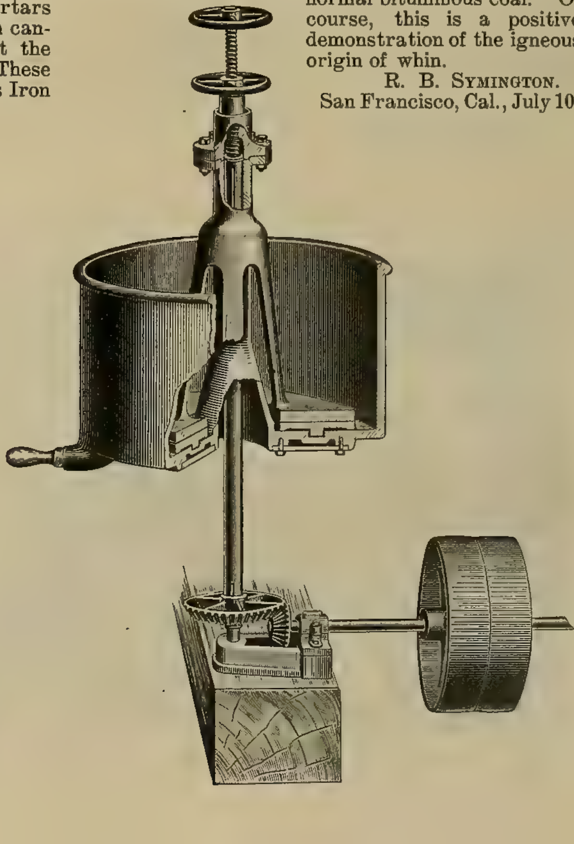
The ancient river bed on the bank of which the tree stood contained gold, and it was in quest of this that the vitals of the mountain were probed and the tree discovered. Several small oaks, having the appearance of what is common in the arid parts of California as scrub oaks, were also found upon the same and opposite bank of the dead river, but they were insignificant as compared with the majestic bearing and perfect preservation of this strong and noble cedar. All vestiges of needles had disappeared, but some of the elongated tips of the branches remained, and many cones were found upon it. These crumbled to dust as soon as brought to the air; as also did the bark, but the wood was firm and sound, the trunk being about 3 feet in diameter at its base, the roots tough and of the tenacity of seasoned wood.—West Coast Lumberman.

Quartzite and Whin.

TO THE EDITOR:—In last week's "Concentrates" "whin" is stated to be quartzite. Quartzite is metamorphic sandstone of sedimentary origin, but whin is a term applied to igneous rocks, popularly known as greenstone or trap, and embracing basalt, diabase, etc.

Whin dykes and overflows traverse the coal measures and indicate their vicinity by first rendering bituminous coals anthracitic in character, but closer approach destroys the coal. Where the whin dyke is cut through, the same thing, but in opposite order, is found on the other side: first the "burnt" coal, then the "blind" or smokeless anthracite, which gradually, but in a short distance, changes to the normal bituminous coal. Of course, this is a positive demonstration of the igneous origin of whin.

R. B. SYMINGTON.
San Francisco, Cal., July 10.



Concentration of Ores by Petroleum.*

By CHARLES M. ROLKER.

The working of the Elmore concentration process at Glasdir, Wales, consists in crushing low-grade copper ore by a Comet breaker, followed by smaller ordinary jaw breakers, passing the material to rollers (crushing wet), and the product of these to 5-foot Huntington mills provided with No. 6 (jabbed) needle mesh screens (the fines produced by the Comet are screened out and fed direct to the Huntington mills). The underlying principles of the process are:

The specific gravity of water being to that of the residuum oil as 0.89, a given quantity of residuum oil to a given quantity of water will float on its surface. The residuum oil, of proper consistency, can theoretically be loaded to 10% before the loaded oil will sink in water.

The viscosity of the oil is the all-important point. It varies with different temperatures. The thinner the oil, owing to higher temperature, the less the adhesive force and the power of carrying the intended mineral load, although the specific gravity is decreased and its loading capacity should be increased under No. 1.

It seems that the adhesive property of the oil, under given conditions, acts with predilection or affinity for bright unoxidized pulverized sulphurets, as against similarly pulverized rock constituents. (I am not prepared to substitute the word "metallic" for "mineral," as the patentee does.)

With a given mineralization in an ore—the required quantity of oil and its viscosity determined (by previous experiments on the basis of Nos. 1 and 2) to bring about a good concentration in a given quantity of water at a given temperature—the concentrates grow impurer if the quantity of oil is increased, since then rocky particles are taken up mechanically simultaneously with the mineral. The rocky particles drop out again on allowing time for clearing and settling. As the latter cannot be done on a large scale, the right quantity of oil is an essential feature to start with. These are practically the underlying principles of the Elmore process.

In a rough outline the mixture of pulverized ore and water is fed into the end of a drum, which is caused to revolve slowly on rollers by means of a worm. Oil is added by a separate pipe, made preferably telescopic to admit of it being discharged at different distances from the end. At each end there is a circular opening, and within the drum annular helical ribs extend from end to end. The spaces between these ribs are divided into cells by a number of equidistant blades, to effect a thorough intermingling of the oil with the pulp and water, without being broken up. All three are carried to the opposite end of the cylinder or drum from the one where they entered, whence they are discharged through a number of circumferential holes into the subsidence vessel, where the water and sand or pulp are allowed to subside, the buoyant oil carrying the mineral ingredients floating on top. The oil is admitted at the same end as the feed. There are two or three drums, one underneath the other, the second treating the tailings of the first, and so on as the case may require. The feeding of the pulp, as well as of the ore and oil, is done in the upper cylinder. It is of importance to determine the point at which, in the length of the drum, the oil is to be admitted. If admitted at the beginning of the cylinder, the entering oil would probably take up at once so much of the mineral as would make it sink in the feed water, and prevent its floating. The point of entry of the oil depends on the amount of mineral in the ore, and must be determined in each instance.

At Glasdir, where the ore impregnation is on the average very fine copper and iron pyrites in an altered slate, I ascertained that practice had established a use of five times the weight of the ore as the correct amount of the water.

The oil used in the mill is the residuum of distillation after gasoline, benzolene and illuminating oil have been removed.

The right amount of oil to be added for the Glasdir ore Messrs. Elmore determined to be about equal weights, or one ton of oil to one ton of ore. This amount varies with every ore. The oil, owing to its viscosity, will not flow readily, and small rotary pumps are introduced, acting like meters, propelling it forward. I found it impossible to determine the loss of oil by measurement. The storage tank contained more oil after the test than before, probably due to the retained water and air. Messrs. Elmore determined the loss of oil, based on the experience of a run of over 700 tons, including what is retained in the concentrates, the tailings and what is lost by waste, to be two gallons per ton of ore treated. In my tests I found the amount of oil retained by the concentrates and tailings to be about one and a quarter gallons per ton. As the test was probably more carefully made than the 700-ton run, I think it safer to assume the experience of Messrs. Elmore, that is, a loss of two gallons per ton of ore with the Glasdir ore.

The mixture discharged through the holes from the drum flows, as I mentioned before, into the subsidence vessel. Additional oil may be added to this vessel, at some distance down, by means of a separate pipe, to aid in floating the mixture.

From the subsidence vessel, in which the water and tailings are drained at the bottom, the oil carrying the mineral is pumped to a hydro-extractor having a solid basket with a projecting flange at the top. The hydro is found to give good results, running from 750 to 800 revolutions per minute. During the action of the machine the mineral and water pack in vertical walls, and the oil floating on the water rises vertically on the wall and creeps over the flange, or lid, of the solid basket and drops into the space between the basket and the enclosing monitor, and from there goes to temporary storage tanks, whence it is pumped again to reservoir or stock tank. The separated water is let out through an opening at the bottom, covered with a cone cover, after the machine comes to rest. The mineral is packed solid along the inner periphery of the basket. The final draining of the oil and water is accomplished in a smaller hydro-extractor with a perforated basket, or periphery, to which the mineral is transferred. The oil and water escape through the meshes, and concentrates carrying about 4% of oil and 4% of water remain behind.

I have tested the proficiency of the process on the very low-grade copper ore from the Glasdir mine, carrying about, on an average, 1.12% copper, 0.049 ounce of gold per ton of 2240 pounds, and 0.8 ounce of silver per ton of 2240 pounds. Seven distinct and separate runs were made on this ore by the inventor under my supervision, treating in all forty-three tons of rock. We obtained an average saving of 69% of the gold, 65% of the silver and 70% of the copper, with a rate of concentration of about fourteen to one. This is certainly a good saving when we consider the low-grade character of the material operated upon.

The percentage of yield of the metals is not the final net yield. It is subject to the usual smelters' charges and reductions for treatment on concentrates produced.

If the viscosity of the oil requires to be increased, the inventor adds from 2% to 3% of mineral butter, a later distillation product of residuum oil. If owing to climatic conditions the oil has to be thinned, a previous distillation product has to be added to the residuum oil. The temperature of the oil and water at the Glasdir works is kept between 54° and 57°, though it is possible that wider margins may be permissible.

It is very difficult to estimate the cost of the process, but, roughly speaking, it can be taken at that of crushing and grinding ores to 30-mesh fine, and the usual cost of concentrating such ore, plus two gallons of oil per ton of ore, plus the royalty the owners may charge. All extra cost of oil loss (price at Barmouth, Wales, $8\frac{1}{8}$d per gallon) and royalty to be paid has to be covered by the difference in yield between wet concentration and this process. I am convinced this process has individual applicability, but it would be a mistake to assume that it can be applied to any and all ores; its field is limited. How the oil will act on any of the copper ores besides the before cited copper pyrites I am not in a position to say. Each ore will have to be tested, in representative large lots, before it would be safe and prudent to draw the conclusion that it can be treated by the Elmore process.

---

*Condensed from paper read at Mining Institute.

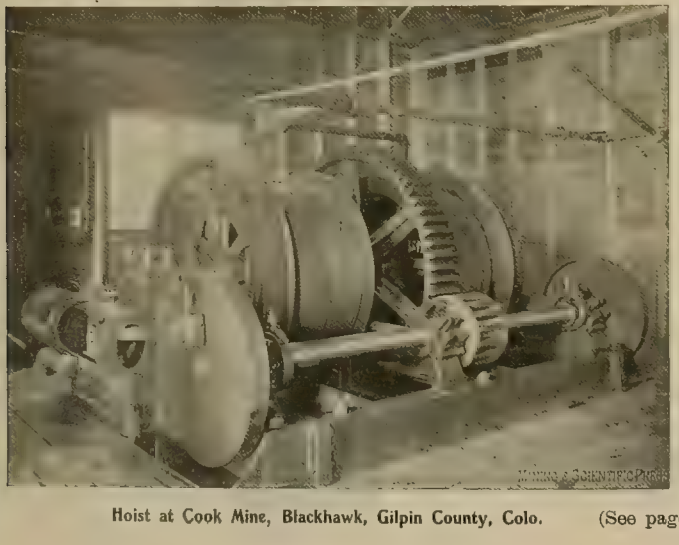
Central California Electric Co.

One mile north of Auburn, Cal., the main or Bear river canal of the Yuba Water Co. has a fall of about 200 feet within a distance of half a mile. Previous to the summer of 1898 the water flowed down Auburn ravine, but has since been diverted to the canal. At this point of junction a power house has been erected. A reservoir, capable of holding a day's supply, was built at the head of the ravine. The pipe connecting the reservoir and the power house is of riveted sheet steel varying in thickness from No. 12 to No. 6 at the receiver end. It is altogether 3100 feet in length, the first 20 feet being 54 inches diameter, which narrows to 200 feet of 40-inch and finally to 36-inch, which size is maintained throughout the remainder of its length. With the exception of about 200 feet the pipe is buried at least 1 foot under the surface.

The electrical equipment was furnished by the Westinghouse Electric & Manufacturing Co. The generator at Auburn is of the revolving armature type, 500 kilowatt capacity, 550 volts and sixty cycles at 300 revolutions per minute. The generator is set on four blocks of granite which stand on the natural bedrock, well grouted with cement. The cables from the generator run under the main floor to the switchboard and thence to the transformers which are behind it. The transformers, four in number, are 125 kilowatt capacity each, and transform from 550 volts two-phase, to 15,000 three-phase. High tension fuses are in a framework under the arresters. At one side of the building near the main water wheel, but on the station floor proper, is a $7\frac{1}{2}$ kilowatt exciter, direct connected to a 12 H. P. Pelton water motor. These are mounted upon the same base.

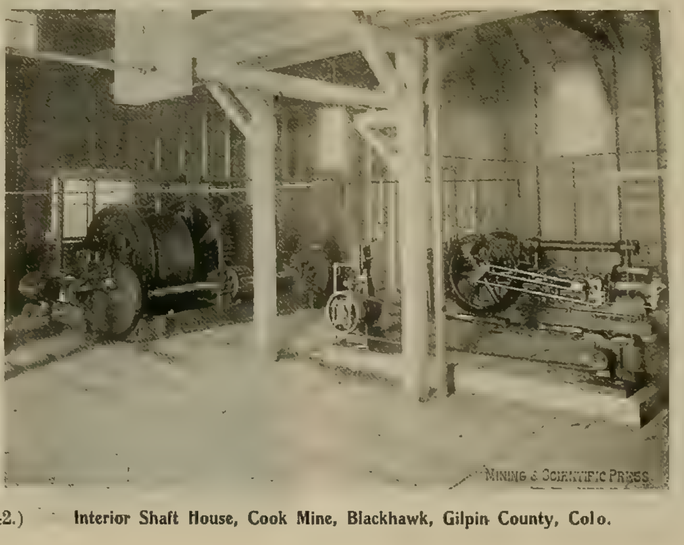
The regulation is done entirely by using the deflecting hoods, which throw the water directly into the tail race. There is no attempt at saving water as the flow in the canal must be maintained at all times. A by-pass is provided to keep up the supply of water in the canal when the machines are not running. The main pipe is tapped near the rear of the building with an 8-inch gate valve, with a discharge pipe into the tail race; this, as well as the main pipe in the building, is imbedded in concrete to prevent any vibration or displacement. At the rear of the building a 12-inch gate valve in the main pipe discharges into the ravine.

The main transmission line consists of three No. 4 hard drawn copper wires supported on Locke three petticoat glass insulators on locust pins, the latter being boiled in paraffine before using. The poles are 30-foot sawed redwood. The line runs directly to the Newcastle generating station, terminating in a marble plugboard with two panels and four sets of three plugs each. The Newcastle and Auburn plants are arranged to run in parallel, the current being transmitted to Sacramento, 29 miles distant from Newcastle, 34 miles from Auburn. The synchronising lamps at Auburn are connected in, one on the transformer, and one on the generator side of one of the main switches. In order to synchronise the two plants, current from the plant which is running is allowed to flow to the other station, stepping down through the transformers. The generator is then started, and the switches thrown in in the ordinary manner. When the two stations are running together all regulation is done at Newcastle, the station at Auburn carrying a prescribed load, and increasing or decreasing 100 H. P. at a time as the total load may require and at the direction of the man in charge of the Newcastle station. It is found that if the machines at Auburn be underexcited the machines at Newcastle may be overexcited to compensate.



Hoist at Cook Mine, Blackhawk, Gilpin County, Colo.

(See page 42.)



Interior Shaft House, Cook Mine, Blackhawk, Gilpin County, Colo.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—There are now forty-five sailing and steam ships at anchor, besides numerous tugs and lighters; lightering is a slow business. Passengers of the Santa Ana were unfortunate in having their baggage burned at sea before reaching Dutch Harbor, and in being quarantined, with the Ohio, at Egg island, for smallpox. There are 30,000 people here, most of whom are tented in and around the city—an orderly, quiet place considering all things, although there is some stealing of boats in place of horses, and other minor offenses, some jumping of town lots ending in shooting scrapes and lives taken. The U. S. Commissioner is doing his best to attend to the police business, but finds far more than he can dispose of. If there is excitement over the outlook, it is certainly of a subdued nature. There are any number of claims for sale or lease, owned by the older residents who wish to return to the States, and many hundreds of new comers are already returning, some without going out of town, who either lack courage or think discretion the better part of valor. The departures will increase from now on. Many Dawsonites arriving "over the ice" this spring say they have left a better country than this and are returning, but none of the new arrivals have had sufficient opportunity to base their opinion on personal experience. The first from Dawson via the river and St. Michaels arrived here June 10. There are several steam and gasoline pumping plants and all manner of machinery for saving gold being landed along the beach, principally between Snake and Penny rivers, on ground which was worked over with rockers last year, but is now expected to pay with a sluice head of water. The various degrees and phases of inexperience of the operators of some of these plants will account, in part at least, for the discouraging results obtained in some cases. Some who are rocking on the beach are making from 1 to 2 ozs. a day, but the large majority are only making grub. Some lucky ones discovered about 800 yards of remarkably rich beach at Topkok and took out big money; four men are reported to have taken out $35,000 each in a week, but say they got practically all in sight. Pumping plants will be located there. Preparations are being pushed for work on creek claims, and by the middle of next month mining for this season will be in full swing. Prices are going down daily. Lumber is now $95 and coal $60; square meals, $2; two eggs fried and ham, $1; bread, 25 cents a loaf; bunks for the night $1 to $4, there being far too few places for the crowds the ships are landing to sleep in, people's tents and outfits being among the freight, which is landed slowly. Boats are at a premium. Ordinary whipsawed lumber Yukon river row boats, 20 feet long, brought $200 each a week ago, but now sell readily for $100 each. Boat building is a leading industry. The post office arrangements are wholly inadequate. One has to wait an hour in a line of fifty for his turn at the general delivery window, if his name begins from A to L, but if fortunate to have a name beginning from M to Z, he gets his mail quicker. Freighting in boats holding, say, two tons, along the beach, is $4 to $8 an hour; two horses and wagon, $10 an hour. Here are some advertisements around town: "$1000 will buy one of the best lays in the country, if taken at once." "Mining claims for sale." "Lot 30x90 feet, facing Front and Beach, $4000." "For sale, twenty head mules and horses." "For sale, tundra claim; 25 cents a pan has been taken out; price, $7000."(!) "For sale, wagon, team and harness, all in good shape, $900." "For sale, ten tons of hay, oats and corn, $12 per ton." "For sale, a complete sluicing outfit—pumps, engine, etc.—a snap." Building is going on rapidly, as lumber arrives. Wages, carpenters, $1.50 an hour; longshoremen, $1 an hour.

Nome, June 29.

The St. Paul from Cape Nome, June 27th, arrived in San Francisco July 10th. She brought $1,500,000, of which about $100,000 came from Nome, the rest from the Klondike. All the passengers tell the same story. Dr. Z. T. Mallaby thinks there will be worse than the bubonic plague there soon. "There are about 15 miles of tents along the beach, and it is as much as a man's life is worth for an outsider to venture among them. There is absolutely no sanitation, and when the swamp begins to dry up the men will die like flies in summer from typhoid fever. Dawson in its worst days could not compare with Nome, and the thought of the wretchedness that will prevail there next winter is enough to make a man shudder. There are at least 30,000 people up there, and how 20,000 of them are going to live is a mystery. The stories about $4 an hour being paid for labor are false; $1 an hour is the limit, and men are clambering over each other to get that. Nome is rich. I don't think there is any question about that, but no one has done any prospecting, as every man is defending his claim with a shotgun."

Twenty cases of smallpox to July 2 are officially reported at Cape Nome.

ARIZONA.

COCHISE COUNTY.

Near Bisbee the Lowell & Arizona will erect a 300-ton smelter. The shaft will be sunk 1000 feet.

GRAHAM COUNTY.

The Arizona Copper Co. at Clifton reports its copper production for May was 651 short tons.

The Shannon Copper Co. are investigating the mine before reduction works are decided on.

The smelting plant and concentrator of the Detroit Copper Co., at Morenci, recently destroyed by fire, will be replaced at once; the Morenci & Southern Railroad will soon be completed to the camp. Heretofore all material has been hauled from Clifton by team.

MOJAVE COUNTY.

The main shaft of the Tennessee mine is being sunk another 100 feet. The mill will resume when the shaft reaches the 500 level.

PINAL COUNTY.

The plant of the St. Louis Gold Extraction Co. at Mammoth, recently closed down by a temporary injunction, is expected to soon resume operations. The company proposes to put up $20,000 in cash in lieu of the $20,000 bond required of them by the court before entering an order dissolving the temporary injunction.

YAVAPAI COUNTY.

(Special Correspondence).—Walker is on Lynx creek, of old-time placer fame, but, of late, quartz mines with promising prospects are prominent.

At the Penn M. Co.'s property thirty tons of ore are run through a 5 foot Huntington mill and concentrated; three four-horse teams haul the concentrates to Prescott, 12 miles.

A. J. Doran is working the Accidental, on which he has built a 5-stamp mill.

Preparations are being made to start up the Kennedy mill.

Dr. Lewis is developing the Honolulu.

E. S. Howard will be manager of the Oriental Co.'s mill, on Big Bug.

Walker, July 6.

On the 6th inst. fire destroyed the greater portion of the mining camp of McCabe, 20 miles from Prescott.

The Mountainside M. & M. Co. has been organized at Clinton, Iowa, to operate gold mines near Stanton.

At Groom creek Supt. Mackin is in charge of the Silver King. Supt. McPherson has completed a 10-stamp mill for the Empire.

CALIFORNIA.

AMADOR COUNTY.

Dispatch: The water is out of the old shaft at the Oneida mine; the bottom now is 11 feet below the 1350-foot level. The time occupied in clearing the old shaft, with its hundreds of feet of drifts of water was less than ten months. The mill will soon be ready to run.——At the Peerless mine Supt. Osborne reports the shaft down 325 feet; 5 feet of good rock in the bottom.

CALAVERAS COUNTY.

(Special Correspondence).—The Melones tunnel is now in a distance of 3400 feet; face in soft talc, requiring timbering. The average progress per week to date from March, 1899, has been 53.12 feet.

Robinsons July 11.

(Special Correspondence).—The California & Ophir mine here has been bonded to San Francisco men. A shaft is being sunk; depth now over 90 feet. Wm. Miller, formerly foreman Utica mine, is interested in the bond and has charge of the development work. The rock shows free gold and prospects well. They have encountered a great deal of water.

Carson, July 10.

A new boiler is being erected at the Bruner mine, near Angels, so as to permit of further development.

Prospect: The Ghost mine is being unwatered.——The San Justo, on Carson Creek, will soon begin crushing rock. Supt. Flint proposes to make the mine a profitable producer.

EL DORADO COUNTY.

The El Dorado W. & D. G. M. Co. is preparing to work its property.

Nugget: Drew, Cohn & Donnelly are turning the South Fork of the American river at Salmon Falls, under the supervision of J. Wild.——Reese & Roelke have bought a two-thirds interest in the Harrison quartz mine, Kelsey district.——The 5-stamp mill at the Wagner mine on Traverse creek is in operation.——Twenty-five men are now employed at the Kimbal G. M. Co.'s gravel mine near Placerville. One hundred tons of gravel are put through the mill each twenty-four hours.

INYO COUNTY.

Supt. Matthews of the Utah & Inyo M. Co. will begin marketing ore next month. He is raising nothing that shows less than 30% lead, with fair values in silver.

KERN COUNTY.

Bakersfield Californian: J. B. Treadwell has three wells pumping at McKittrick, averaging 300 barrels per day; larger pumps will be put in. In the Kern river fields Mr. Treadwell has thirteen wells finished and three others under way. Those now completed will probably yield at the rate of 1000 barrels daily until the "head" is pumped off.

LASSEN COUNTY.

At Hayden Hill there has been placed an attachment on the Golden Eagle mine.

LOS ANGELES COUNTY.

The Westlake Oil Co. has twenty-six wells pumping and expects soon to have two more on the pump. In wells Nos. 27 and 28 the drills have struck oil sand and are still drilling.

The Primrose Crude Oil Co., drilling in the northwestern section of Los Angeles, is using a rotary jig.

Mining Review: The American Oil & Asphalt Refining Co. is enlarging its Los Angeles refinery from a capacity of 250 barrels of crude oil per day to 1000 barrels.

NEVADA COUNTY.

The Red Cross mine at Omega is to have the engine and boiler from the Sunflower mine near Pike City, Sierra county.

The Brunswick Con. G. M. Co. has levied an assessment of 7 cents per share, delinquent August 20.

At the Pennsylvania mine a new station is being put in at the 700-foot level.

PLACER COUNTY.

Heber Holman, former Supt. Best & Belcher, Gould & Curry and Utah Con. mines, is developing mining property near Colfax.

PLUMAS COUNTY.

Supt. Gray of the Rich Bar M. Co. is about to begin sinking the shaft.

SAN BENITO COUNTY.

Eighteen Japanese going to work at the New Idria quicksilver mines were met by four miners, who said that if the Japanese were to get the same wages as the white men—$1.75 to $2.50 a day—they could go to work. The Japanese were under contract to work for $1.25 a day, and the miners turned them back.

SAN BERNARDINO COUNTY.

The S. P. Co.'s raising of the freight rate on raw borax from $6 to $28 a ton, which caused shutdown of the refining works at Alameda point, is said to have been rescinded and the former rate restored. The matter was editorially noted last week. It is stated that the big advance in freight rates on the crude product was made by the railroad company after it was learned that the borax was being put through a process at the mines which took out 25% of the weight by evaporation. The saving of freight was about one-fourth. The raise resulted in shutting down the works at Alameda, the freight business of the borax company going to the Santa Fe, as it was cheaper to ship direct to the refinery in New York.

The Santa Fe Ry. Co. will build tanks for storing oil to be used in all the engines operated between Needles and Point Richmond, to hold 250,000 gallons of oil, at Barstow and Mojave.

SHASTA COUNTY.

The assessment of the Iron Mountain mine for the current year is $1,750,000.

The Harrison Gulch mine is assessed to the Midas G. M. Co. at $100,000.

The Balaklala M. Co. has made final entry in the U. S. Land Office for a patent to the thirteen claims of the Balaklala group, making final payment of $1025.

Democrat: At the Arps group of mines at Copper City the new tunnel is in 400 feet.——The National mine in Churntown district has been temporarily closed down.——Twenty stamps are dropping at the Midas mine, in Harrison Gulch district.——The tunnel in the Crystal Pool copper mine, Stillwater district, near Pit river, is in 40 feet and parallels the big ledge. Some good sulphide ore is shown and the wall rock carries gold and silver.

SIERRA COUNTY.

At Brandy City Manager J. Arnott of the Monterey M. Co. has men driving the main tunnel to reach the pay channel.

SISKIYOU COUNTY.

From the Dewey mine, Gazelle district, ore is hauled to the railroad, a carload per day. Freight to the Keswick smelter is $2.40 per ton. The ledge has been developed by a tunnel 425 feet. Supt. Boyle has thirty men at work.

E. D. Baker has bought the Black Bluff mine, Fool's Paradise, for $10,000. The shaft is now down 40 feet and a contract has been let for a 200-foot tunnel. He will put in a small stamp mill.

E. D. Baker, working his Cherry Hill quartz mine at Cherry Creek, has $5300, the result of twenty-four days' run of the mill. He has good ore in sight.

TRINITY COUNTY.

Fillius & King have a bond on a copper prospect on Eel river. The ore assays 9% to 13% copper and an average of $4 gold. They will put men to work Aug. 1.

Supt. Dobler of the Brown Bear mine at Deadwood expects to have the new 10-stamp mill at the lower tunnel finished and in operation by September 10.

TUOLUMNE COUNTY.

(Special Correspondence).—Mr. Poundstone has charge of the Densmore mine, near Columbia, and is running a lower tunnel for Messrs. Hayward et al., who own the property, to develop more ore.

The Norwegian mine at Tuttletown has struck another rich bunch of ore and is looking well.

At the Bown mine Supt. Rule is doing development work on the east vein, where they have a good body of ore. Work on the west vein has been temporarily abandoned.

Columbia, July 11.

At Big Oak Flat the shaft at the Four Oaks is at 200 feet; crosscutting is being done to tap the vein.

Supt. J. McCallum, at the Kanaka, has his mill in operation. At 600 feet a crosscut has developed a body of ore.

The Dutch M. & M. Co. has levied an assessment of 15 cents per share, delinquent July 30.

The Mazeppa G. M. Co. has levied an assessment of 3 cents per share, delinquent August 7.

Independent: The Sunnyside mine, Summersville, is sold by H. Smith to Baker Bros.——The Draper mine shaft is clear of water.——At the Siberian mine, near Columbia, a mill is talked of. F. Reinville has charge of the work.——The Treasure group, near Columbia, is being operated by the Federal Exploration Co. of New York. W. H. Frye has charge.——The new water ditch for the Horse Shoe Bend property will be 8 feet wide by 4 feet deep, calculated to carry 10,000 miner's inches.——The Free Lance, Berger's ranch, is operating five stamps.

VENTURA COUNTY.

At Los Angeles on the 9th inst., Judge Ross in the U. S. Circuit Court gave a decision in the case of the Olive L. & D. Co. against W. H. Olmstead et al. The suit was brought to quiet title to oil bearing lands in this county. The plaintiffs had secured an order requiring defendants to show cause why they should not be permanently enjoined from boring for oil on said lands. The decree is entered in favor of the complainant. The case is important in that it upholds the rights of those who hold lands through locations obtained by the use of scrip, which lands are known as lieu lands. The Court affirms that the settling upon lands as agricultural claims is sufficient to hold it, even though others should come along and oust the settler by putting up monuments and laying claim to the land as a mineral claim. Thousands of acres of land held by settlers as agricultural land in central and southern California has been relocated and is now being held by mineral claim locators as oil lands. It was almost a foregone conclusion that Judge Ross would decide as he has. His decision in the case of the Nevada Sierra Oil Co. vs. Home Oil Co. last December showed what his decision in this last case would be. In both decisions he followed the letter though not the spirit of the law, and it is doubtful if his decision would be overruled were the case taken to the appellate court. This whole question of scrip and law of title to oil lands was clearly and ably set forth and discussed in the issues of April 7, 14 and 21, 1900, the best exposition of this important subject that has appeared.

COLORADO.

(Special Correspondence).—The Colorado & Southern, Colorado Midland and the Rio Grande Western railways are now operated as one system, each road, however, maintaining its separate organization. The Colorado Midland line runs from Colorado Springs via Leadville to Grand Junction; the Colorado & Southern reaches out from Denver to the mining districts of Gilpin, Clear Creek, Boulder, Park, Summit, Lake and Gunnison counties, to Colorado Springs, Pueblo and Trinidad. It reaches Cripple Creek over the Midland and Midland Terminal. It is believed a line will be constructed, connecting the South Park branch of the Southern with the Midland, to make a shorter line between Denver and Cripple Creek and between Denver and Leadville. The Rio Grande Western, whose main line runs from Grand Junction, Colo., to Ogden, Utah, handles the western business not only of the Colorado & Southern–Midland lines, but that of the Denver &

Rio Grande, the lines of the latter system reaching such districts as Cripple Creek, Leadville, Aspen, the San Juan, Gunnison, Creede and Trinidad. In general, the two systems rival each other in the Arkansas valley, Cripple Creek, Gunnison, Aspen and the Trinidad section; and while Boulder, Gilpin, Clear Creek, the South Park and the Blue River regions are strictly the territory of the Southern–Midland combination, the Denver & Rio Grande is supreme in San Luis valley, Creede, the San Juan and the lower course of the Gunnison. The resources of Rio Blanco and Routt counties are attracting much attention, great as they are known to be in mineral and grazing wealth, and it is not difficult to foresee activity in railroad building that will connect that well-watered section of mountain and valley with Denver.

Denver, July 4.

BOULDER COUNTY.

Thirty-five men are employed at the B. & M. mine, at Ward. High-grade ore from the 400-level is shipped to Denver. A new 100 H. P. boiler is just installed in connection with two others, with capacity of 85 and 35 H. P., respectively.

Samuel Knott is now superintending work on the Nancy group at Wall Street.

CUSTER COUNTY.

(Special Correspondence).—The Geyser mine, at Silver Cliff, whose shaft is 2650 feet deep, was closed down on the 5th inst., an assignment having been made to W. J. Elmendorf. Current debts for labor, fuel, supplies, etc., amount to $25,000. A reorganization is looked for, and it is believed the idleness will be only temporary. It is claimed nearly $2,000,000 have been expended on the Geyser. It is also claimed that good ore has been found at various depths.

Silver Cliff, July 8.

DOLORES COUNTY.

(Special Correspondence).—The Atlantic Cable group, at Rico, owned by T. Walter Beam, and under bond to the New Jersey Zinc Co., is attracting much attention by reason of the discovery thereon of a contact deposit of zinc-lead-copper ore, with some gold and silver, which is shown to be 40 feet thick where the work is being done. The ledge is almost horizontal and is between lime and porphyry. This and other development give Rico a lively character.

Rico, July 3.

EAGLE COUNTY.

Near Fulford the Mendota mine is being developed by the Golden Rule T. & M. Co. The vein is 12 feet wide, the pay streak 4 feet thick. The ore assays from $10 to $27 per ton gold. Within the dolomite is a porphyry dyke. Under this porphyry and on the top of a lime floor, or foot wall, is a vein of white quartz and clay from 2 to 10 feet thick, carrying fine ore.

FREMONT COUNTY.

The Rocky Mt. Smelting Co.'s plant at Florence will be ready on September 15. The main furnace building is to be of steel, 235 feet long and 75 feet wide; the ore from the time it enters the buildings until it leaves the furnaces will be handled automatically.

GILPIN COUNTY.

(Special Correspondence). — The 80-stamp mill of the Boston & Denver M. & M. Co., erected at Blackhawk by the Hendrie & Bolthoff Mfg. & Supply Co., is completed and in operation. It is near the top of the Gregory incline and at the terminus of the car tramway which connects the mill with the 400-foot level of the Cook mine, by means of tunnels. The tunnel entrance is on a level with the crushing floor of the mill. The ore, as it is delivered from the cars, passes over grizzlies, of which there are four, the fine ore sifting through the latter and passing direct to the stamps. The coarse, passing over the grizzlies, is reduced to 2½-inch sizes by four Blake crushers, run by a 60 H. P. engine, for this special purpose, which is set on the third floor. The crushing floor is 42x66 feet, below which is the distributing floor, with four bins, from which the ore is distributed to sixteen bins, ranged along above the battery floor, there being one feeder bin to each 5-stamp battery. The ore feeds from bins to batteries through Bolthoff automatic feeders. The line shaft, 6 inches in diameter and 184 feet long, is connected by belt with the driving pulley of the engine. The cam shafting is divided into eight sections, each section connecting with the master shaft by belt and pulley and operating ten stamps. By this arrangement any section of ten stamps may start or stop independently of the others. Besides, patent fingers are provided, which work by eccentrics, by which any stamp may be hung up. The battery posts are 12x24 inches and 22 feet long. The stamps are 1000-pounders, dropping about ninety-five per minute. The cams are of the Bolthoff patent, each having, in addition to the regular type of key, a gib key which passes through the cam, over the shaft, pressing down upon the latter, making the fastening more secure. (See engraving on front page.)

Below each 5-stamp battery is an amalgamating plate of soft copper, superplated with 2½ ozs. of silver to the square foot. Each plate is 5x18 feet. The material passes from the sixteen plates to twenty-four Woodbury concentrators, ranged in two rows on the lower floor, material from every two plates discharging upon three tables. The concentrates will be delivered into cars for shipment by belt conveyors, there being one conveyor to each three tables. It is estimated the capacity of the mill will be 300 to 350 tons of ore per twenty-four hours, and will require two crews of six men each.

The power to run the stamps and concentrators is a Standard Sioux Corliss engine, 250 H. P., with cylinder 20 inches diameter and 42-inch stroke. The fly-wheel is 15 feet diameter and weighs three and a half tons; the driving pulley is 10 feet diameter by 30-inch face. The engine is provided with latest pattern of valve gearing, water relief and oiling devices. The power is derived from four boilers of 100 H. P. each.

Blackhawk, June 19.

At Central the Gettysburg mine is reported to have, at a depth of 50 feet, a vein of smelting ore 16 inches wide—$50 a ton—"yellow copper," "white iron" and "peacock."

The ore shipments of smelting rock and mill concentrates from the county for June amounted to 225 cars, or 4590 tons.

LAKE COUNTY.

(Special Correspondence).—The Starr placer grounds, comprising 35 acres along California gulch, are reported sold to C. B. Kountze and associates of Denver. This is considered very valuable ground.

Much interest at Leadville centers in the mineral ground lying immediately under the business portion of the town. Recent developments in the Home and other down-town groups make it certain that the ground under Harrison avenue—the main business street of the town—has great mineral value; but this ground belongs to the numerous lot owners, because title passed to them originally without reserving mineral rights. Efforts are being made by various companies to acquire by purchase or lease sufficient contiguous ground from the lot owners to warrant starting mining operations, but the task is proving slow and difficult. It results, however, in giving many persons a snug sum for the underground segments of their lots which they never counted on.

The original workings in Leadville district were in the placer grounds of California gulch in 1860. From that date to 1878 they produced millions of dollars in gold; and since the discovery of the silver-lead-carbonate contacts, which made the camp famous, these placers have been continuously worked in a small way. A number of men are working them this season.

Leadville, July 5.

At Leadville on the 4th were broken some drilling records. Andregg & Chamberlain of Victor drilled 39$\frac{17}{32}$ inches in Gunnison granite in fifteen minutes; Richard Conley of Victor, single-handed, 21½ inches.

The Miner thinks that a zinc smelter that could save the zinc and silver values would be a big dividend earner in Leadville. There are quantities of ore carrying from 5 to 15 ozs. in silver with percentages of 10% to 50% zinc, most of which at the present time cannot be treated to advantage on account of the heavy penalties imposed in the ordinary lead smelters and the loss in values of zinc. The Miner thinks that could the zinc and silver values both be saved it would increase the output of that camp close to 25% in value.

LA PLATA COUNTY.

The Gold King Con. M. Co. incorporated under the laws of Maine, capital $6,000,000; will acquire twenty-eight mining properties in southwestern Colorado.

OURAY COUNTY.

(Special Correspondence).—More activity on Red mountain than for several years is reported. It is expected the railroad tracks will reach this locality from the Ouray side soon. The Silver Ledge, Bobtail, Vanderbilt, National and Robinson are shipping regularly, and the Mono has ore on dump ready for shipment.

Ouray, July 8.

ROUTT COUNTY.

(Special Correspondence).—It is given out that a shipment of copper ore will be made from the Farwell district, which is claimed to be rich enough to stand a wagon haul of 100 miles to the nearest railroad point, thence by rail to the smelter.

Hahn's Peak, July 4.

SAGUACHE COUNTY.

(Special Correspondence).—The Bassick mine at Silver Cliff is shipping about 100 tons of concentrates per month to the smelters.

Silver Cliff, July 7.

Near Crestone the Cleveland–Boston group is sold by Coleman & Quinn to A. Emanuel of Cleveland, O., for $30,000. The Cleveland is down 220 feet and shows hematite that runs $100 per ton. The new owners will put on a steam hoist and sink 200 feet deeper.

At the San Isabel, north of Crestone, work on the mines and mill has resumed.

SAN JUAN COUNTY.

The last shipment of 400 pounds from the Sylvanite mine, taken from different parts of that property, gave returns of 28½ ozs. gold and 36 ozs. silver for the highest lot, the lowest giving 22 ozs. gold.

TELLER COUNTY.

(Special Correspondence). — The Bull Hill Con. M. Co. is the name of a new corporation promoted by the Woods Investment Co., to take over about eighty acres of mineral ground on Bull hill, in the neighborhood of the Wild Horse mine, also owned by the Woods people. It is given out that the recently acquired tract was purchased from various parties by the Woods Co. at a cost of about half a million dollars.

Victor, July 9.

For the first half of 1900 Cripple Creek produced gold to the value of $12,413,070. Of this, incorporated companies paid $3,500,000 in dividends.

The Gold Coin mine during June produced 3600 tons of ore, the greater part of a smelting grade. The average value of the ore for 1899 was $46.50.

The monthly tonnage of the Elkton is about 1100 tons, of an average value of $90 per ton.

A small "rush" is reported from Cripple Creek district to a new find 10 miles north of Victor and 8 from Pike's peak, at graders' camp No. 5. It consists of a vein 2 inches in width containing fluorspar and talc.

IDAHO.

ADA COUNTY.

Mgr. Anderson, in the Viola mine, Black Hornet district, has a ledge of high grade ore on the 400-foot level that he thinks justifies "the installation of a large plant." His address is Boise, Idaho.

IDAHO COUNTY.

The Little Giant mine at Warren is sold to Walter Hovey Hill, trustee, for $100,000. A company is being formed to develop the property.

LATAH COUNTY.

The Muscovite mica mine has a carload of mica at Troy awaiting shipment. A tunnel is being run to tap the vein 300 feet below the present workings.

SHOSHONE COUNTY.

J. P. Keane has a contract for 7000 feet of tunnel on the Empire State property, at Government Gulch. It is now in 500 feet. It is 8x8 feet in the clear, with a flume underneath, for the water, 10 inches deep by 3 feet wide.

WASHINGTON COUNTY.

At Weiser the Thunder Mountain Con. G. M. Co., Ltd., has decided to suspend operations. One of the obstacles was that a payment of $9000 was due the owners.

MISSOURI.

BARRY COUNTY.

A. H. Mayne, formerly of the Daisy, Mercur, Utah, has acquired 9000 acres of zinc-bearing ground in this county, involving an outlay of nearly $200,000.

MONTANA.

BEAVERHEAD COUNTY.

D. T. Haskett, working tailings at the Hecla, Glendale, is operating a mill there at a profit.

BROADWATER COUNTY.

The Iron Age, at Winston, employs twenty men and ships six cars per month of pyritic iron ore to the East Helena smelter. The ore carries gold.

DEER LODGE COUNTY.

The Amalgamated Copper Co. has refused the request of the Butte Miners' Union for an eight-hour day, and each side is waiting.

On the Big Blackfoot, 40 miles north of Drummond, the Montana Copper M. Co. is driving three tunnels. On the Bryan a tunnel is being driven 750 feet; on the Copper World 500 feet and on the Porto Rico 325 feet.

At the Anaconda are to be six new 150 H. P. tubular boilers, which, with the six 200 H. P. marine boilers, will connect with the single steel stack recently completed.

FERGUS COUNTY.

Near Lewiston, H. T. Kendall, Supt. Moccasin mines, is building a cyanide plant, capacity 114 tons daily.

JEFFERSON COUNTY.

The Queen mine at Elkhorn is in operation.

J. O. Briscoe has charge of the Minah property near Wickes.

MADISON COUNTY.

W. Dickerson, manager German Bar M. Co., says the dredgers are satisfactory and fuel is hard to get. He pays $4 a cord.

SILVER BOW COUNTY.

E. Wright has sold to the Butte Con. M. Co. the Plumber quartz claim, near the old Boston & Montana smelter, for $15,000.

NEVADA.

ELKO COUNTY.

During the year ending July 9th the earnings of the Dexter M. Co. at Tuscarora amounted to $237,526.86, of which $41,189.57 was net.

LINCOLN COUNTY.

Fay, two miles from Deer Lodge, is Nevada's newest mining camp.

The Horse Shoe mine gives employment to 100 men. Work on the new mill will start August 1.

The DeLamar mine paid a county bullion tax of $4920.20 for the three months ending June 30.

STOREY COUNTY.

The electric power line will be completed to Virginia City August 1. The sub-station near the C. & C. shaft is nearly completed. The new Gould & Curry mill is under way.

The Con. Cal. & V. M. Co. directors have an agreement with the Selby Smelting and Lead Works to ship the latter all the first-class ore the mine can produce, up to 500 tons per month, valued by assay not less than $35 per ton, to Selby, Vallejo Junction, to be sampled and sold. The directors will have all ores assaying below $35 per ton treated at the Kinkead mill.

NEW MEXICO.

BERNALILLO COUNTY.

Manager Wynkoop of the Cochiti R. & D. Co., Woodbury, tells the New Mexican his belief that lightning caused the fire which destroyed the Woodbury mill. The plant cost $52,000, was insured in a Denver agency for $10,000. Mr. Wynkoop says a new plant will be put up; he will put in the cyanide leaching system straight and the combination of pan amalgamation and cyanide used in the old mill. The new mill will cost nearly $100,000 and will daily treat 100 tons of ore from the Iron King mine.

GRANT COUNTY.

The smelting plant of the Silver City Reduction Works is handling 150 tons per day and employing seventy-five men.

The Wilson M. & M. Co. has incorporated at Santa Fe, capital $30,000, to work property at Stein's Pass.

New Mexican: About 200 men are employed by the Santa Fe G. & C. Co. at San Pedro. The new 200-ton smelter will start by October 1, when 500 men will be given employment.——The Central mine is being reopened by Newbery & Terry. —— Within a radius of 25 miles from Cerillos 2000 men are employed in gold, silver, lead and copper properties ——The Cerillos smelter is running satisfactorily.

OREGON.

GRANT COUNTY.

Near Granite, H. S. McCallum, manager Bald Mountain G. M. Co., has paid to R. C. Haywood $20,000—second payment on purchase price of the Bald Mountain mine.

JOSEPHINE COUNTY.

The Humason 5-stamp custom quartz mill at Gold Hill is at work.

LANE COUNTY.

At Blue River the Lucky Boy 10-stamp mill has been going day and night since it was started last December. The company will add ten more stamps to the mill.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Homestake M. Co. is repairing the Father DeSmet and Caledonia stamp mills at Central City. The water ditch from the Spearfish river will be completed November 1, at a cost of nearly $1,000,000. It is figured that this water supply will be sufficient for the running of the two old mills now being repaired, together with the four mills now in operation. With the Caledonia and DeSmet mills in operation there will be a total of about 900 stamps at work. It is expected that the company will have the 1000-ton cyanide plant completed within three months. The company now has 2300 men at work. The Review says the Ellison hoisting plant has been completed at a cost of about $250,000.

UTAH.

SALT LAKE COUNTY.

The Highland Boy smelter, since the

plant was started up in June, 1899, has shipped 111 carloads copper pigs, approximately 6,600,000 pounds. G. K. Fischer will have the capacity of the present smelter doubled by 1901.

SUMMIT COUNTY.

Record: J. McGregor of the Crescent contemplates starting a tunnel in Nigger hollow, to be driven into the hill 2 miles to strike the ore bodies at about 2700 feet. ——Supt. Hickey of the Comstock Co. will sink a three-compartment shaft 300 feet before crosscutting.

TOOELE COUNTY.

Manager Bothwell of the Sacramento at Mercur milled 3600 tons in June with forty-two men. His expenses were $3500.

F. G. Janney, Supt. Golden Gate mill at Mercur, is daily crushing 700 tons.

WASHINGTON.

FERRY COUNTY.

At Republic there is a dividend payer. There are two mines that can produce 100 tons of ore per day—the Mountain Lion and Republic; by the close of the year it is expected that the Black Tail, San Poil, Tom Thumb, Quilp and Chico will be in the list. The payroll of the camp is about $50,000 per month. The Republic employs 159 men, the Mountain Lion 75, the Quilp and Tom Thumb 29 each.

OKANOGAN COUNTY.

F. D. Howe, consulting engineer Okanogan Free Gold mines, near Oro, says the mill is not running, and will not be started until such time as the mine is in a state of development that will insure a continuous supply of ore.

STEVENS COUNTY.

At Nelson, in the Reservation M. & M. Co.'s property, Manager Atchison during the past two months has put in a 40 H. P. hoist and a 10-drill compressor.

FOREIGN.

BRITISH COLUMBIA.

At the B. C. mine, in Summit Camp, there are eighty men employed; fifteen are ore sorters. Shipping is at the rate of fifty tons daily.

H. R. Bellamy of Nelson will put in a dredge of 2000 yards daily capacity on the Jameson Creek property. It will cost $45,000.

At the Anderson Lake mines, Lillooet district, the 10-stamp mill is running day and night. The lowest grade ore is now being treated at a profit. It is expected to add ten other stamps to the mill. Mr. Newsom of San Francisco has been in charge.

Many Italians are being brought in to work in mines on Red mountain, Rossland.

Work has begun on a crosscut tunnel at the Slocan Star, surveyed a length of 2100 feet.

The last Chinese miner has now left the Extension and Alexandra collieries of the Dunsmuir Co. There is a commensurate influx of white workers and their families.

The report of the directors of the Golden River Quesnelle, Limited, claims the practical ruination of the company's property by the action of the Cariboo hydraulic people in depositing their tailings and debris from their working into the bed of the river. The company's solicitors have drafted a case for the opinion of counsel. The funds of the company will not permit of any legal action being begun.

Supt. Spaulding, of the Cannon Ball mines, on the west side of Christina lake, Rossland, has a hoist and pumping plant on and men sinking. The ledge is 12 feet wide, carrying gold, copper and galena.

Kaslo Kootenaian: It is a year since the eight-hour law went into operation; the mines are beginning to resume their old rate of shipping. Kaslo is the chief town of the Ainsworth mining division, but many of the big Slocan mines also ship through this port. According to figures obtained from the customs house, there are 200 mines under development roundabout. Of these, 90 are foreign shippers and 30 are paying or have paid dividends. The amount of dividends paid to date by the Slocan and Ainsworth mines which ship through here totals $7,800,000.

Phœnix reports the ore bins of the Old Ironsides, Knob Hill and Victoria mines full with 8000 tons of ore, waiting to be transported to the Granby smelter at Grand Forks as soon as the C. P. R. R. can handle it.

The I X L gives returns of shipments to the Northport, Wash., smelter: Shipment in net tonnage, deducting moisture, 21.41 tons, 20.42 tons averaging $76.25 per ton gave net return, deducting smelter charges and freight, $1557.10, and .99 ton at $2193.21—$2164.70.

Manager Connaught of the Lode Star M. Co., Duncan City, says if railroad facilities were at hand the mine could ship 100 tons per day.

At Greenwood forty men are building the smelter of the B. C. Copper Co. October 1 it will be blown in. Ore bins will hold 400 tons; they are 150x30 feet. The sampler will be a 600-ton: the smokestack will be steel, 75 feet high.

Reports from Horsefly, Cariboo, say that R. H. Campbell of the Miocene Co. is nearly to the gravel in the drift he is running at a depth of 550 feet.

Nelson sends returns of the Athabasca mill run for June: $27,594.72; 29 days and 9 hours; 475 tons of ore were milled; value of bullion recovered, $21,675; concentrates, $5919.73; $58.09 per ton was recovered; 80.6% extracted by amalgamation. The mine is situated on Morning mountain, 2 miles south of Nelson; it has a 10-stamp mill.

CANADA.

At Port Arthur an electric power plant to generate 600,000 H. P. is to be erected, to utilize the falls of the Kaministiqua river, near that place and Port Williams. It is proposed to invest $5,000,000 in the works.

MEXICO.

A company is organized in Louisville, Ky., to work a group of copper claims 30 miles from Dolores, southwestern Chihuahua; E. R. Simpkins is manager.

A strike is reported from the Corretas district, 60 miles from Casas Grandes. A 5-foot ledge of copper has been uncovered.

One hundred and fifty pack mules recently arrived in Casas Grandes loaded with silver ore from the Pilares district, Sonora. The ore can be loaded on wagons at Oaxaca, Sonora, but the last shipment was carried through to Casas Grandes on mules.

Chihuahua Enterprise: If negotiations now being carried on are successful, Torreon will have two large smelters. One of these is to be started by Torreon, Saltillo and Monterey parties with a capital of $2,000,000. The establishment of this smelter at Torreon has been talked of for some weeks, and now comes another proposition by R. S. Towne, president Compania Metalurgista Mexicana, to erect a smelter at a cost of $5,000,000.

Six miles from Nacosari, Sonora, the new smelter is completed at a total cost of $3,000,000. The railroad from the mines to the smelter is hauling ore for reduction; there is enough on the ground to keep the furnaces busy for two months. Men are preparing to fire up.

THE KLONDIKE.

The report of R. G. McConnell shows production as follows:

1897	$ 2,500,000
1898	10,000,000
1899	16,000,000
Total	$28,500,000

It is unlikely, Mr. McConnell says, that the rapid increase in production of the last two years will be continued, as serious inroads have already been made on the rich portions of El Dorado and Bonanza creeks, and to a less extent on Hunker and Dominion creeks, but the amounts remaining with the long stretches of medium and low grade gravels still untouched on all the creeks ensure high production for a number of years. Bonanza creek is the most important gold-bearing creek in the Klondike district. The gravels, however, have not proved uniform in value, and stretches occur which have proved too barren to work under present conditions. The richest portion extends from Victoria gulch down stream for about 2 miles. A number of claims in this stretch, he says, will yield over half a million dollars each. Mr. McConnell expresses his opinion that the placer gold, like the accompanying gravels, is of local origin, and derived from the quartz veins and silicified schists of the district. The large nuggets nearly always enclose fragments of quartz, and quartz pebbles specked with gold are occasionally found. A boulder found on No. 4, Bonanza creek, weighting 60 ozs., contained 20 ozs. of gold. Evidence of the local origin of the gold is also afforded by the markedly angular and unworn character of the grains and nuggets found in the gulches and along the upper parts of the productive creeks. The prospecting of the past two seasons has resulted in the staking of a number of quartz claims, but very little development work has been done. Prospecting can only be carried on at present over a small portion of the district, as the country rocks are nearly everywhere concealed beneath a heavy blanket of moss. Hence free milling gold mining is as yet a thing of the future in the Yukon, and only exceptionally high-grade deposits will there pay, under necessary costly conditions of life and work.

Books Received.

ENCYCLOPEDIA OF MEXICAN MINING LAW, a 200-page book, giving a well-arranged resume of the leading points in the mining law of our sister republic. In view of the interest in Mexican mines, this little volume is of timely value. It is published by Richard E. Chism, City of Mexico; price, $2.50.

Personal.

WM. P. BLAKE, geologist of Arizona, is in New Haven, Conn.

T. W. WOODBRIDGE is chemist at the Vindicator mine, Victor, Colo.

LEO VON ROSENBERG, a New York mining man, is in San Francisco.

CAPT. DELAMAR has returned from Europe to Salt Lake City, Utah.

W. G. NEBEKER of Salt Lake, Utah, is examining California mining property.

H. M. PEASE has resigned the superintendency of the Mazeppa mine, Tuolumne county, Cal.

L. G. LINN, representing Pittsburg capital, is operating a mine near Idaho Springs, Colo.

G. F. SIMMONS of British Columbia is in southern Chihuahua, Mexico, investigating copper property.

J. RALSTON BELL, formerly Supt. Grand Victory mine, Placerville, Cal., is in Grand Encampment, Wyo.

JOHN HEWITT has resigned his position as superintendent of the Gagnon, Mont., mine. William Word succeeds him.

C. RHODES, Mgr. New Zealand M. Co., Ltd., who has been looking at California smelting operations, has gone for similar purpose to Argentine, Kansas.

VICTOR M. CLEMENT is locally credited with intent to examine the Johnny mine, Stateline, Utah, and say whether it is worth the large price at which it is valued.

F. SWINDLER, superintendent De La Mar mine and mill, De La Mar, Nev., has been tendered a similar position at the Cochiti mine, Bland, N. M., and will probably accept.

B. C. CONDIT has resigned the superintendency of the Standard Electric Co., in Calaveras county, Cal., to accept the general superintendency of the Truckee River G. E. Co. He is succeeded by D. Frye.

W. B. DEVEREUX, M. E., of New York, one of the directors of the Melones, Cal., M. Co., has returned to Glenwood Springs, Colo., after a week's visit at the Melones, arranging plans for completion of the dam in Stanislaus river and the 120-stamp mill.

J. F. KIDDER, California State Debris Commissioner, has appointed James F. Robinson of Grass Valley, Cal., secretary of the California Debris Commission. The position carries a salary of $125 a month and has been vacant since the former incumbency of R. L. Thomas.

HENRY W. TURNER of the U. S. Geological Survey, Washington, D. C., is in San Francisco. He has been in the high Sierras and will make further reconnoissance this summer in Mono and Inyo counties. Mr. Turner and his colleagues have given service of great economic value and their work inures to the immediate benefit of the mining world.

GEO. E. ROBERTS, Director U. S. Mint, thinks $300,000,000 a fair estimate of this year's gold yield, and that the world's gold output will not be long in reaching $400,000,000 per annum. Although South Africa remains at the head of the column, the United States, now that the Klondike and Cape Nome are both producing, is likely to follow but a little way behind. An estimate received by him at Washington, D. C., on the 1st inst., places the gold output of the Klondike of this year at $18,000,000. He expects about $10,000,000 from Cape Nome.

Commercial Paragraphs.

THE Keystone Driller Co., Beaver Falls, Pa., recently shipped two of its largest steam drilling machines to Tomsk, Siberia, for a gold mining company.

GEO. O. BRADLEY AND D. C. JACKLING are opening a machinery supply house at Spokane, Wash., in charge of C. R. Brough, formerly of Salt Lake City, Utah.

RECENT SHIPMENTS from Eureka, Nev., included 60,000 pounds of scrap iron to the Joshua Hendy Machine Co. and 44,000 pounds to the Judson Iron Works, San Francisco.

THE Western Machinery & Supply Co., 159–161 La Salle St., Chicago, Ill., supply screening machinery; their specialty is the vibratory screen and they furnish full free information to inquirers.

DR. A. R. LE DOUX of New York City has purchased the right to use the pneumatic cyanide process in the cyanide plant of the Great Northern M. & D. Co., at Gilt Edge, Mont., which is considered the largest cyanide mill in that State.

THE Burt Mfg. Co. of Akron, Ohio, last week made one of the largest shipments of the year to their London agency. The demand for Cross oil filters in England, where they are in competition with a dozen or so of English filters, is another indication of the popularity of American manufactured goods abroad.

THE Canton Steel Co. of Canton, Ohio, from January 1 to July 1, 1900, shipped to consumers and dealers in the mining sections of the West and Northwest approximately 1,000,000 pounds of steel, for use strictly in connection with the mining industry, which figures convey some idea of the large tonnage of steel required in mining operations.

ABOUT 100 Wilfley concentrators per month are turned out at the Wilfley shops in Denver, Colo., where about 120 men are employed in their manufacture. In the woodwork white pine is used for the bedding frame and California redwood for the decks. This shop supplies most of those which are sold in the United States and British Columbia, there being shops for their manufacture in London and Mexico City.

FRASER & CHALMERS, Chicago, report having received from the Anaconda Copper M. Co. orders for a large amount of machinery for their new concentrating plant, which will have a capacity of 4000 tons per day. This machinery includes twenty-four heavy-pattern 5-foot Huntington centrifugal roller quartz mills, twenty-four sets of 40x16-inch crushing rolls with forged steel shells, and twenty-four Blake crushers, sizes 24x12 inches and 15x9 inches.

THE Hendrie & Bolthoff Mfg. & Supply Co. of Denver, Colo., recently furnished a 20x48 Corliss, flat-rope hoist for the Vindicator mine, Cripple Creek district, which is being installed. A similar hoist will be furnished the Gold Coin Co., foundation for which is being laid. This company also report a new hoist of same style for the Portland G. M. Co. at Victor, and one of same size and type for the Elkton mine. This house is also furnishing a steel gallows-frame for the Elkton.

THE Colorado Iron Works, Denver, Colo., have manufactured and set up twenty-three smelting furnaces in various parts of the country within the past year, there having been about an equal number each of the lead and copper type. One of the latest orders was a U-pipe, hot-blast stove for the Mountain Copper Co., at Keswick, Cal. This company is now manufacturing Bartlett concentrators at the rate of fifty per month, and this capacity will be increased. Numerous changes have been made in this table within the last two years, and it is now considered a table adaptable to all classes of ore. It is substantially built, weighing 2600 pounds.

"**THE** Spanish war," says E. H. Osborne, secretary National Tube Works, "was the greatest advertisement that America and American manufacturers ever got. It was worth millions to us as an advertisement. Take the battleship Oregon alone. Could anybody doubt, after the unparalleled performance of that wonderful ship—15,000 miles without a nut having to be screwed up—that American artisans, inventors and manufacturers know their business? We made the tubes of the Oregon, and of the Olympia and the Monterey. It isn't a bit of wonder to me that Irving M. Scott of the Union Iron Works, the builder of these vessels, was seriously spoken of at Philadelphia as a possible Vice-Presidential nominee."

THE Mine & Smelter Supply Co. of Denver, Colo, are thoroughly testing a new power drill called the Durkee Lightning Drill, invented by L. Durkee of Denver, Colo. It is a mechanical drill, operated by an electrical motor through a flexible shaft. Well-known and thoroughly tried devices are used as far as possible in the drill. The chuck and rotating devices are the same as those used in ordinary air drills, as is also the guide shell with feeding device. Movement is imparted to the drill rod through a bell crank, the vertical leg of which drives a crosshead which is loose on the drill rod. The horizontal leg of the bell crank is slotted, and in this slot plays a brass on a crank pin. This crank pin is rotated at about 600 revolutions per minute, and is so placed in the slot of the bell crank that the upward motion of the pin draws the drill from the rock while the bearing is at the outer end of the bell crank or at the point farthest from the pivot. This causes the drill to be drawn from the rock at comparatively slow speed, but with greater power, as the pressure is applied at the long end of the lever. As the driving crank rotates farther, the drill rod is thrown toward the rock by the downward motion of the crank pin at a point nearer the pivot, which causes a very rapid movement of the drill, the movement being at its maximum velocity near the end of the stroke. The forward motion of the drill against the rock occupies about one-third the time that the backward motion requires. The crosshead on the rod gives motion to the drill rod through a strong buffer spring which bears against a collar on the drill rod. As the cross-head draws the drill backward it also operates through a second spring against a second collar on the rod. Buffer springs are also provided to relieve the machine when the drill does not strike the rock. The simplicity of the drill commends itself to the observer and tests thus far have been satisfactory.

Recently Declared Mining Dividends.

Silver King, Utah, 50 cents, $75,000. July 10
La Fortuna M. Co., Arizona, 10 cents .... July 15
Daly-West M. Co., Utah, 25 cents, $37,000 .... July 16
Portland, Colo., 6 cents, $180,000... July 16
Gold King M. Co., Colo., 3 cents, $28,105.50 .... July 20
Vindicator Con. G. M. Co., Colo., 5 cents, $55,000 .... July 25

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING JULY 3, 1900.

652,880.—GAME—J. W. Batdorf, Hollister, Cal.
653,057.—MAIL BAGS—C. Bateman, Gales Creek, Or.
652,882.—CART—Y. H. Boudreau, Modesto, Cal.
652,911.—CONVEYOR AND ELEVATOR—G. E. Bowers, S. F.
652,889.—SURGICAL PAD—Tillie Campbell, Oakland, Cal.
653.166.—BUNSEN BURNER—H. B. Cary, Los Angeles, Cal.
653,000.—BOILER BRACE—P. F. Dundon, S. F.
652,842.—CULTIVATOR—Grimm & Fullerton, Oakesdale, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SURGICAL PAD.—No. 652,889. Dated July 3, 1900. Tillie Campbell, M. D., Oakland, Cal. This invention relates to a pad which is especially designed for obstetrical and surgical operations. It consists of a base having a surrounding hollow rim, with means for supplying hot water to fill and warm the apparatus, a drainage canal connecting with the front, and longitudinally disposed seams with intermediate ridges which form independent drainage channels to conduct away any liquid to the drainage canal. This seems to answer the double purpose of preventing the central part from rising up like a cushion, and also to form drainage channels connecting with the single receiver and discharge tube. Exit passages discharge the water from the pad, and it may be gradually discharged, while a new supply is admitted from the fountain.

FUEL ECONOMIZER.—No. 652,895. Dated July 3, 1900. J. H. Hobart, El Paso, Texas; one-half assigned to E. R. Phillips of same place. The object of this invention is to provide a device which is especially adapted for economizing in the combustion of fuel, especially where used in conjunction with steam boilers of any description. The firebox of the boiler has an arch fitted in the upper part, with an internal chamber, and a wall built up from the lower part of the firebox forms the heat passage between itself and the arch above. Passages are made in the wall and connections from the firebox, with means for connecting the passages with the chamber of the arch, and means connecting said chamber with the heat passage between the arch and the wall. Transverse water pipes have their ends connected directly with the water legs of the firebox, and serve to support the arch.

REGULATING DEVICES FOR RIDING CARTS.—No. 652,882. Dated July 3, 1900. Y. H. Boudreau, Modesto, Cal. This invention is designed to relieve the disagreeable movements of two-wheeled carts, which are drawn by a single horse, and to prevent the jerk caused by sudden starting or stopping of the animal, and also to reduce the tilting of the cart body in going up or down hill. It comprises a bent or crank axle, upon the central portion of which the vehicle body is supported, the upwardly and outwardly turned ends forming the wheel spindles. Clips are fixed to the axles between the wheel spindles and the crank portion, and fulcrum pins extending through the upper parts of the clips support the shaft by which the vehicle is drawn. Rigid bars are clipped beneath the axle extending parallel to and beneath the shafts, and springs are clipped between the axle and these rigid bars, having their ends upturned to form elastic contacts with the lower part of the shafts on each side of the axle. Plates are hinged beneath the shafts and form connections between the shafts and the spring ends.

PORTABLE CONVEYOR AND ELEVATOR.—No. 652,911. Dated July 3, 1900. Geo. E. Bowers, San Francisco, Cal. The object of this invention is to provide a device which is designed for transporting and elevating earth from excavations or pits such as are made in the construction of buildings, whereby the earth to be removed is conveyed from any point in the excavation to the elevator, by which it is afterwards raised to the level of the street or other point of deposit. The mechanism is so contrived that by means of a horizontal carrier, which may be elevated or depressed, the earth can be transported to a point where it is received upon an inclined elevator, which conveys it to a sufficient height to be discharged through a chute into wagons or other places of deposit. This second elevator is also so mounted with relation to the first that it can be adjusted to accommodate itself to the movements of the horizontal elevator.

Latest Market Reports.

SAN FRANCISCO, July 12, 1900.

MICHIGAN COLLEGE OF MINES.
An Engineering School with unique location, giving it unusual facilities. Distinctive methods of instruction. Special courses. For catalogue giving occupation of graduates, address
F. W. MCNAIR, President, Houghton, Mich.

SITUATIONS WANTED.

Engineer and Metallurgist, graduate Freiberg, with years of experience in mining, smelting, exploration and ore treatment methods, with most exceptional references, seeks position. No objection to go anywhere. Speaks five languages. Fearless, energetic and temperate. Mexico, Alaska, or South America. Address MINERO, this office.

An Experienced, Aggressive Mining Engineer and Metallurgist, technical graduate, eighteen years' practical experience in the United States and Canada as manager and consulting engineer of mines and mills, is open to engagement as manager, superintendent or chemist. Thoroughly understands economic mining and reduction of gold and silver ores. Not afraid of a hard proposition. Can leave present position with month's notice. Correspondence solicited and references exchanged. Address KARL NEITZEL, Camp McKinney. B. C.

EXPERIENCED METALLURGIST DESIRES position in charge of a gold mill or cyanide plant. Thorough chemist and assayer. Understands handling machinery. Technical graduate. References. Address "Millman," Box A, this office.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

MINE SUPERINTENDENT, TEN YEARS' experience in Michigan, Montana and Idaho, desires engagement as Supt. or manager of developing or producing property in this country or abroad. Best of reference. Address D. C., care this office.

WANTED—SITUATION
by an experienced general clerk, for some good mining company. Address C. CHALUPECKY, 532 Geary street, San Francisco, Cal.

CYANIDING.
Have had charge of five mills and worked in every part of process from shoveling to laboratory work. Test ores and outline process for treating them. For three years treated SLIMES successfully. Wish a position after July 10. Have studied to excel. References as to character and ability.
Address K. C. N., Boise, Idaho, Box 3.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

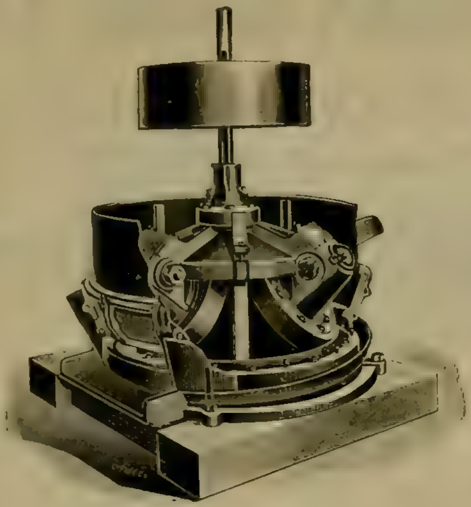
The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO.,

San Leandro, Cal., U. S. A.



THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

A MODERN COPPER SMELTER

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

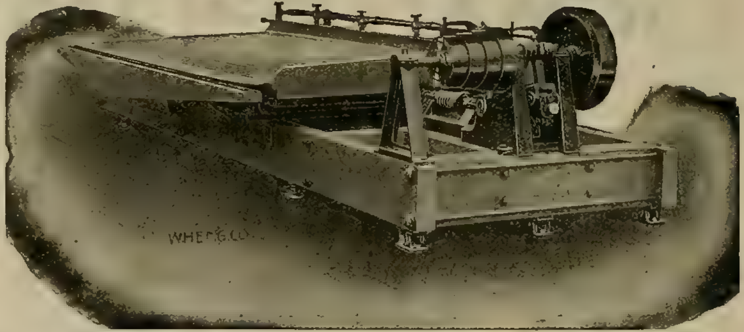
(SEE PAGE 57.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post**, March 2nd, 1900.

"Empire, Colo.: **The success achieved** by the **Cammett tables** in handling the ore from the Maud S. mine, **an ore especially difficult to concentrate** on account of the **great variety** of its **metallic contents**, has given the Bonaccord mill a reputation that will firmly establish it as a safe plant for general custom work."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

—THE—

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

THE BUCYRUS COMPANY,

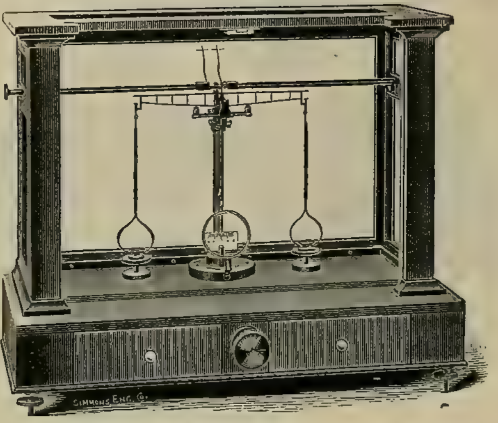
The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and relibale pocket instrument on the market. Send for illustrated Catalogue B to



No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Penghana, Tasmania.

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of July, 1900, an assessment (No. 17) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of August, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 4th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1900, an assessment (No. 119) of fifteen cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 14th day of August, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 25) has been postponed to MONDAY, the 16th day of July, 1900, and the day of sale from the 21st day of July, 1900, to TUESDAY, the 7th day of August, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 12) has been postponed to Thursday, the 26th day of July, 1900, and the day of sale from August 1st, 1900, to MONDAY, August 20th, 1900.

By order of the Board of Directors.

THE LITTLE ALASKA GOLD WASHER.

Price $6.

Saves the Gold.

Weighs only **7 1-2 Lbs.**

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

Weight, 160 lbs.; capacity, 15 to 30 tons per day.

These machines save the gold WITHOUT THE USE OF WATER, enabling the miner to thoroughly prospect on the spot and successfully work the rich benches and gulches, when water is not convenient. The separation is accomplished by graduated air current. These machines are especially adapted for saving flour and beach gold. No quicksilver being used, the iron-coated beach gold of Cape Nome, so difficult to amalgamate, is saved with these machines as easily as though the gold was clean. Send for descriptive circulars.

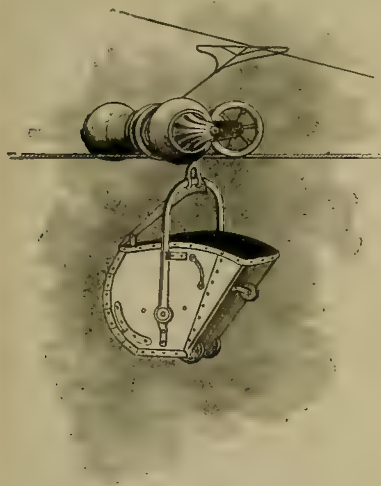
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2087.—VOLUME LXXXI. Number 3. SAN FRANCISCO, SATURDAY, JULY 21, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

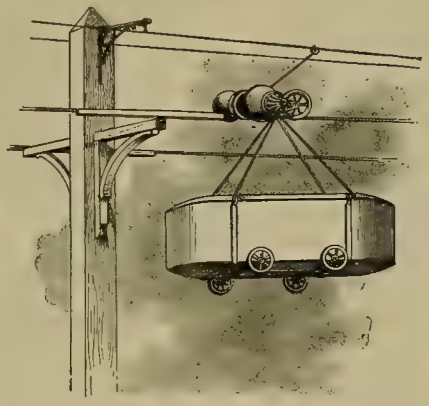
A New Phase of an Old Industry.

In preceding issues has been noted the advance in lighting, railways, power transmission, telegraphy, telephony and other forms of electric appliance. The subject of telpherage deserves passing notice.

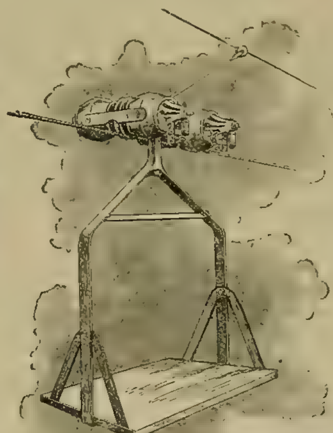
Telpherage is described as being automatic aerial transportation by the aid of electricity, especially that system in which carriages having independent motors are run on a stout wire conducting an electric current from which the motive power is derived. Telpherage is a name coined by the late Fleeming Jenkin to designate a system devised by him by which the transmission of vehicles by electricity to a distance is effected independently of any control exercised from the vehicle. It is an aerial electrical railway.



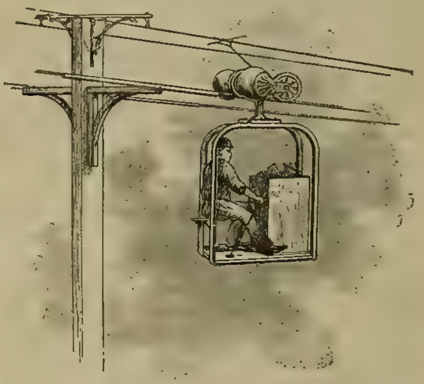
Telpher With Ore or Coal Bucket.



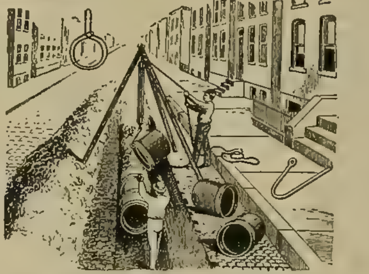
Mail Car Adapted for Transfer to Surface or Underground Dispatch.



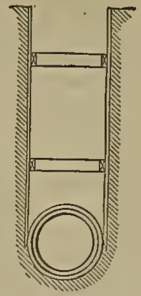
Telpher With Platform Car.



Mail Carrier With Attendant.

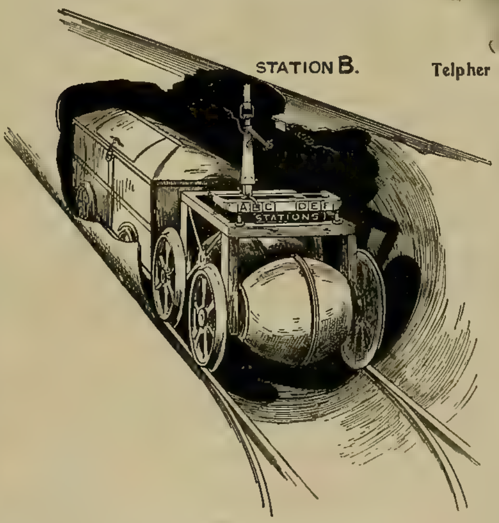


Lowering Short Sections of Pipe for Tubular Dispatch.

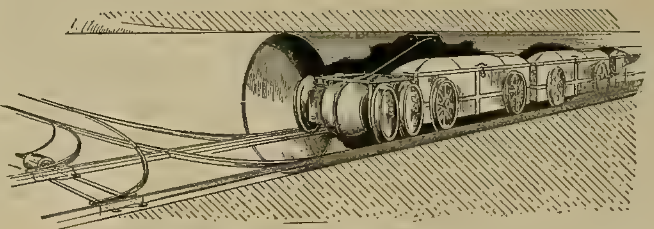


Section of Trench With Dispatch Tube.

Sheeting Deep Trench for 36-Inch Dispatch Tube.



Car Adjusted to Stop at Numbered Station.



Package Car in Transit; Electric Tubular Dispatch.

This, then, is a new phase of an old industry, the application of electricity to the existing principle of aerial wire ropeways, now becoming so deservedly common wherever mining or manufacturing is carried on in a large way. This is but one of the classes into which telpherage is divided. There are also systems of telpherage in which are what may be styled electric tube dispatch, either overhead, surface or underground; electric overhead tramrail, by rigidly supported girders; automatic narrow gauge railway.

The main object of telpherage is to provide automatic methods, by the use of electricity, for quick, economical transportation of mail, express, freight and other light material. In aerial telpherage it is not necessary to follow the contour of the country, and rapidity of operation which depends on the speed of the electric car is only limited within reason by the cost of construction, the length of the line from one station being only bounded by the commercial possibilities of electrical transmission. Curves are not considered a disadvantage any more than in the surface electric railways, and the direction of route may be changed as often as desired to avoid excessive grades and thereby cheapen the cost of construction.

Regarding this the Consolidated Telpherage Co. of New York City say that the cost of the line and rolling stock is small and the power required can be rented from any existing electric lighting or railway plant. The electric tube dispatch is another branch of telpherage and consists in sending merchandise, mail and express through tubes which are either underground or at the surface. These tubes are constructed of various substances, depending upon local conditions, in some cases watertight pipes of vitrified clay and like material, and in others tubes of structural iron, the diameter of the tubes varying according to the amount and character of material to be carried within a certain time. The cars run upon steel rails of special form in the tubes, and the cars and rails are of sufficient rigidity and strength to carry merchandise and second-class mail matter. The cars are so arranged as to be operated individually or in trains, depending upon the amount of merchandise required to be sent in a definite period.

The system is wholly automatic. The car is started by turning a switch, and within a short distance the speed can be accelerated up to 50 miles an hour if required, though such a speed, considering the loads which can be carried, would rarely ever be necessary, a speed from 20 to 35 miles per hour fulfilling most conditions of service. The system is so arranged that branch lines can feed into one main trunk line, and each car is so controlled that no two cars can come in collision. In case one car should be traveling the main track and another car should be approaching from a branch or side track to go upon the main track, the second car will stop and wait for the first car to pass on some distance ahead on the main track before starting. This is done automatically. Any car can be arranged to stop at any station upon its route, this being determined before the car leaves the starting station. Cars can also be adjusted so as to take either the left or right hand tracks and thus to make communication with any sub-station. The track can be made single or double, depending upon the number of tons to be transported daily. A complete block system prevents collisions.

The company mentioned claims to have worked the details of its system out completely and tried them in practical operation. In certain cases their success has been due to the development of the art in general and to the great advances made in electricity, for successful telpherage a few years ago would have been impossible. Existing conditions and requirements make the subject one of practical interest to mining men everywhere.

Lead Tariff, Prices and Supply.

The ups and downs of the lead market are so frequent and confusing as to make it difficult of understanding, recent fluctuations showing a difference in current rates of nearly $20 per ton. Much has been said on this important subject, and the multitude of the interests it involves justifies continued mention. A statement of previous and existing facts from an independent standpoint is of present interest. Every one directly or indirectly interested in this subject is presumably acquainted with most of the general facts in connection with the present situation. Probably no part of the metal mining productive world presents so complex an appearance as the present condition of the lead market in the United States, where the trusts, the tariff and the law of supply and demand are the principal factors in the price, each trending back many years, anticipating and creating present conditions.

In 1861 the Morrill tariff bill admitted gold and silver into this country free, the desire then being to get specie to meet Government obligations. A shipload of silver-lead ore arriving occasioned a Treasury Department ruling that, under that tariff, if the value of the silver or gold combined in the ores exceeded the value of the lead therein the whole product should come in free. This west half of America was sparsely settled in those days; mines of any kind were few outside of California, and lead miners fewer still; but in the early '70s lead became a prominent production east of the Sierras, and an ore-producing association was organized in Utah, which, among other things, fought against free lead. They protested and petitioned Congress for an import duty in about the same fashion that the California Miners' Association has fought for a Mineral Lands bill, and their representatives at Washington found many of their protests and letters pigeon-holed, but they kept the fight up and finally got notification from the Treasury Department that they should be granted a hearing—the first of the kind—which was given them in May, 1889. The smelter men of Kansas City and other places wanted the Mexican lead ores to come in free, which was good business from their standpoint, though injurious to the lead producers of the West from their standpoint. The latter won their point, and the Government ruled that thereafter the lead in the ores should be taxed, and appointed an officer to be stationed at El Paso to sample the lead ores from Mexico on the border. The Utah lead producers started to get out lead at a better price, and the smelters started to fill cars nearly full with heavy lead ores, and to pile upon the top of the ores very rich silver ores with a little lead, get that ore sampled, the cars run across the Rio Grande, the rich ores saved and sent back, the heavy lead ores unloaded, the former thus convoying the latter, until John Tiernan was sent by the Utah Lead Ore Producing Association to investigate, going as an ostensible buyer of hides, and after unearthing the subterfuge succeeded in having it stopped. The next movement on the part of the smelters was to secure a Government ruling that, from the samples assayed, 10% should be stricken off as a smelter loss, and 10% more as a loss in refining. The Utah Ore Producers' Association made demonstration, by their El Paso representative, that the total loss in the smelting did not exceed 4% and that the loss in the refining did not exceed 1%. After that was blocked the smelters got a ruling from the Treasury Department permitting ores to be run into bonded warehouses and held six months. How this worked, in their behalf, can be estimated from the fact that the chairman of the Bureau of Statistics for the United States Treasury Department, in 1898, made official report that twenty-one million pounds of lead had been entered that could not be accounted for. In 1898 the smelters secured another ruling which permitted them to account for only 90% of the ore received, and another ruling permitting lead ore to come in free in the slag, in that way "slag" coming in carrying 85% metallic lead. This was ruled out by the Treasury Department, but just two years ago the smelters secured another Government ruling permitting lead in copper matte, where the copper was worth more than the lead, to come in free. This the Utah Ore Producing Association fought to final appeal. None of the above applies to Pacific coast smelters.

All this is merely instanced as a matter of record, to illustrate that while a tariff is a very simple thing it is sometimes difficult to enforce it according to its spirit and intent. The duty on lead in the ore is 1½ cents per pound.

At $4 per 100 pounds there is not much profit in lead mining. There would be still less but for the tariff of $1.50 per 100 pounds. With that tariff off, lead would sell at about the same price in the United States as abroad, except for fluctuations due to variable local demand. It would sell at the present price less $1.50 per 100 pounds. At that price nearly every lead mine in Idaho, Montana, Utah and Colorado would be compelled to idleness. The shutting down of those mines would mean ruin to many.

It is probably an underestimate rather than an exaggeration to say that the tariff on lead has given to the miners of the one State of Utah in a year one million dollars more than they would have received without that tariff on the lead in the ores, and that that amount represents but a part of what the tariff is worth to them or to the miners of Montana, Idaho, Nevada, Colorado, or anywhere else where lead is mined in the States producing gold and silver, for much of this gold and silver comes as part of the product, the great production of lead increasing the amount of the latter. Utah is particularly mentioned as it produces about fifty thousand tons of lead annually, though Idaho, Montana and Colorado are almost equally interested, so that the cry against the tariff on lead in the ore is suicidal.

It will be seen that in one sense it would be to the interest of the smelters to have lead free, while it is equally manifest that if they can so manipulate the tariff on lead as to make it inure both ways to their advantage, it would be particularly gratifying in a pecuniary sense to them. The situation is a complex one. The smelters having failed in their effort to have the tariff so construed, the American Smelting & Refining Co. has been formed, which, as a business proposition, is precisely in the line of modern advance and is just what any other industry so situated would do. It is manifest that this latest consolidation of the lead manipulators has entire control of the price and can raise or depress it as best determined by their immediate or transient interests. All this is entirely from the unbiased and impartial standpoint of this paper, having nothing to do with private interests nor politics, the matter being discussed from a thoroughly independent standpoint.

The recent effort of the principal lead producers to aid in the maintenance of good prices for the raw product seems stultified by the fact that they appear to be necessarily co-operative with the American Smelting & Refining Co., who seem to have in every way the best of it, as probably it is only by increasing their export trade that the American Smelting & Refining Co. can get better prices at home and thus pay the producers more for their ore. The duty on lead being 2⅛ cents per pound precludes any importation and cuts little figure in the case. There is little justly bearing upon the subject in the statements made and the hurried conclusions drawn in some discussions of this subject regarding lower prices of lead in the foreign market as compared with the domestic markets, the fact being clear that were it not for the tariff on lead, even its present price in this country could not be maintained. In the light of the events of the past few weeks and the extraordinary fluctuations of the lead market, it is difficult to predicate how any co-operative efforts by part of the miners and the American Smelting & Refining Co. can be successful. This brings us to the discussion of the last factor in the situation, usually the most important, namely, the law of supply and demand, a law which does not have full force and effect in this case, being sumptuarily interfered with by the position capable of being maintained by the American Smelting & Refining Co., with whom, by reason of all these facts, rests the responsibility for results.

The producers have for some time been endeavoring to make a combination that would set some stable quotations, some figure that could be held to, and several meetings gave color to the belief that progress was being made in that direction. The difficulties in the way were so obvious throughout that little hope was generally entertained that the effort would result successfully. A sort of minor agreement was had with the American Smelting & Refining Co., conditioned on the ability to have general agreement, and about the 1st inst. it looked as though such general co-operation were possible, but the Missouri lead producers have declined to go into any combine, thus deferring what from the start did not look like a hopeful project. Of course, at long last the producers have the strength of the game—that is, were it to come to a final trial of strength between those who produce the ore and those who handle and sell it, if the former unanimously declined to furnish the product it would leave the latter without anything to do business with. The difficulty of making and maintaining a combination among the producers is manifest. The situation is an untoward one and affects all alike, though existing conditions on the Pacific coast do not include any smelter west of the Sierras in the monopoly of the trust. It looks as though there would be a fight and a desperate one, and that meanwhile lead has not reached its lowest point; when it does the purchasers will be heard from in more unanimous vigor than before. The present situation is this: the trust proposes to buy up surplus lead and export it, to keep the surplus down and the home price up, if the producers meanwhile will stand the loss. Missouri lead producers decline to become a party to such compact.

THE Secretary of the Interior, in a decision in a case involving the location of mineral claims in Cripple Creek, Colo., has overturned all former decisions in which it has been held that a deputy mineral surveyor could not locate claims for mineral lands, on the ground that he is a United States officer and that such location by him would be in violation of that section of the Revised Statutes which forbids "officers, clerks and employes" of the Land Department from making entries. W. H. Leffingwell made entries in December, 1897, for three groups of claims. After the entries were made the Land Department refused to issue patents and held the entries invalid, for the reason stated above. The decision was rendered in September, 1899. In this last opinion it is held that the section of the Revised Statutes heretofore quoted does not apply to mineral land surveyors, inasmuch as they are not employes of the Government within the meaning of the law, and they can make entries for mineral lands and receive patents therefor. This applies to mineral land surveyors everywhere.

THE progress and development of the mineral industry of this west half of America is phenomenal. It is not uncommon in this office to receive copies of a paper published in a new mining camp before the slow-going authorities at Washington have made announcement of the establishment of a postoffice there.

Concentrates.

A FINE ruby-colored alloy may be compounded of 22% gold with 78% aluminum.

THE Holloway-Longridge process will successfully extract gold from auriferous antimony ore.

A SIX-POUND lead lining in a chlorination tank, properly put in and fairly used, ought to last four years.

FABRICS of hornblende asbestos will resist acids; serpentine asbestos is susceptible of attack by weak acids.

THE melting point of aluminum is 660° Centigrade; of silver, 970°; of gold, 1062°; copper, 1095°; platinum, 1760°.

"THE lightest substance known" is the pith of the sunflower, specific gravity 0.028. The specific gravity of cork is 0.24.

IT would take 3,138.97 feet of 1-inch rope to wrap a pole 100 feet high, 1 foot diameter at the bottom, 6 inches diameter at the top.

THOS. A. EDISON says that he is to get $1,500,000 if his system for working the properties on the Ortiz, N. M., grant proves a success.

THE most effective grade of aluminum bronze has 11% aluminum, and develops a tensile strength of 78,000 pounds per square inch.

IF it take 12 H. P. to run a compressed air rock drill, with proper receiver capacity a six-drill machine should require no more than 50 H. P.

HENRY BESSEMER died March 15, 1898; his process of converting cast iron into cast steel ranks among the great inventions of the century.

WITH a pressure of forty pounds per square inch the discharge per minute from a straight 2-inch pipe, 40 feet long, would be about 300 gallons.

AN electric liquid forge was produced by G. D. Burton of Massachusetts about two years ago, but has not been a pronounced commercial success.

THE Illinois Steel Works would be the most likely customer for manganese. In the twelve years from 1888 to 1899, inclusive, California produced 6789 tons manganese, worth $60,766.

STEEL PLATES in tanks, etc., will rust rapidly when exposed to moisture impregnated with sulphur arising from soft coal. Frequent painting or varnishing is the best preventive.

1, 7, 3, 9, 5, 2, 8, 4, 10, 6 is a favorite form of drop in a 10-stamp mill. Any particular form used by a millman is capable of detailed and favorable explanation by him as to why it is used.

ELECTRIC PUMPS—that is, power pumps direct connected and driven by an electric motor—work successfully in innumerable instances, delivering from 500 to 20,000 gallons per hour.

UPON the completion of the Trans-siberian Railway it will be quite possible to "go around the world in a month," by securing special trains and making sure connections. There need not be over twelve changes.

COMPRESSED OR LIQUID OXYGEN is recommended as a restorative for victims of foul air in mines. It should be in an appropriate receptacle with reducing valve and mouthpiece, ready for immediate use when wanted.

STEEL containing 22% nickel expands more when heated than ordinary steel does, while steel with 37% nickel hardly expands at all. A variation of 15% of nickel in steel entirely changes the nature of the material.

THE weekly market quotations of lead in London are for long tons—2240 pounds—and for "soft Spanish lead," which is from 2½ to 5 shillings per ton less than the price of English lead, which latter is considered of better quality.

THE test of any form of mineral analysis is its comparative usefulness. Whatever is simple, quick, cheap and fairly accurate is good. Chemical analysis is probably the best basis for mineral identification, but not always practicable.

WM. THOMPSON, or Lord Kelvin, is doubtless the "foremost scientist of the age." He is 76 years old, and in nearly every department of applied science has made discoveries, created new things and aided general advance in organized knowledge.

SURVEYS of mining claims by U. S. Deputy Mineral Surveyors for the purpose of securing a U. S. patent therefor must close within 0.5 foot in 1000 feet. This requires an accuracy in the azimuth of the courses within two minutes of the true mendian.

CANVAS can be made mildew proof without injury to the fabric. Dissolve 1 pound zinc in 40 gallons water, add 1 pound sodium carbonate; when dissolved add 2 ounces tartaric acid. Soak the canvas in the solution for twenty-four hours, and dry without wringing.

A BOILER INSPECTOR can locate a crack by sound or feeling better than by sight. He taps with his hammer along the boiler shell, with his finger on the plate a few inches in advance of the hammer and his sensitive finger will feel the vibration of the plate if it be injured.

IT may be that S. J. Carrigan of Northfield, Minn., has discovered the existence of three hitherto unknown planets between our earth and the sun, "each of which is heading for us and sure to destroy this planet," but the fact is not generally known. It really, however, makes little difference. Probably if this planet were totally destroyed we could all get along just as well without it.

IF at atmospheric pressure the temperature of the boiling water is 212° F., at 80 pounds pressure it would be 322.5° F. The total heat in the steam at atmospheric pressure would be 1.147 heat units; at 80 pounds pressure, 1.182 heat units.

A GOOD substitute for German silver is an alloy of copper, 67.25%; manganese, 18.5%; zinc, 13%; aluminum, 1.25%. The color resembles German silver closely, the alloy is as strong and it has good casting qualities. Its electrical resistance is over three times that of German silver.

AN INK that can be used for writing on glass is prepared as follows: To 20 grammes of brown shellac dissolved in 150 cubic centimeters of lamp spirit add a solution of 35 grammes of borax in 250 cubic centimeters of distilled water. Add 1 gramme of methyl violet for coloring.

CRYOLITE is a double fluoride of aluminum and sodium. It is not of common occurrence. There is a large deposit in Greenland, and it has recently been reported to exist in commercial quantity on the south flank of Pike's Peak, Colorado. It is used in the manufacture of alum and alumina.

A STATEMENT in last Saturday's issue that celestine (strontium sulphate) is not found west of the Rockies needs correction. It is found at Glen Eyrie, in Colorado, and in the colemanite of Death Valley, San Bernardino county, Cal. Strontianite (carbonate of strontium) is found in Plumas county, Cal.

THE gold-dissolving power of a solution of potassium zinc cyanide increases with increased excess of oxygen, and with rise of temperature, and also by addition of caustic alkali, other conditions remaining the same, such increase in the latter case being greatest in solutions to which oxygen has first access.

A RUBBER STAMP on a tracing can be reproduced on a blue print. Make the impression of the stamp on the tracing linen, and while the ink is still moist dust it over with lamp black with a tuft of cotton. The ink takes up the pigment, actinically impenetrable, and the impression shows out in the blue print.

THE safety valve of a boiler may become coated with lime, even though the boiler does not foam, by small particles being lifted and blown through when the safety valve blows off. The space just above the water line in active service is filled with a sort of water mist, raised by the liberation of steam below the surface.

A BLAST FURNACE for lead smelting has been used for many years at Freiberg. The latest account received states that the furnace diameter is increased to 6½ feet and the number of tuyeres to twenty, with the result of output increased from 10% to 38%, a lessened fuel consumption and a reduction of blast pressure.

A SOLDERING FLUID that will not rust nor corrode may be made as follows: To four pounds hydrochloric acid add four pounds zinc shavings or cuttings. To the saturated solution add a small quantity of oxide to color, and filter through a piece of suitable cloth; then add one pound strong liquid ammonia; stir, and bottle.

GLASS has been used as a flux for cyanide slimes in both plumbago and clay-liner crucibles, in the proportion of 100 pounds roasted slimes (not acid treated), 50 pounds ground white glass and 50 pounds borax. M. T. Dixon says that this mixture in a clay-liner pot will give gold 860 fine if treated in a fairly quick furnace.

THE tensile strength of the steel from which a boiler is made is found by pulling a carefully measured bar in a machine which weighs the load required to break the bar. The tensile strength per square inch is found by dividing the total load required to break the bar by the area of its cross-section in square inches before breaking.

THE degree of cold on high Sierra peaks is a matter of record. A self-recording thermometer was left on the summit of Mt. Lyell, 13,041 feet high, during the winter of 1897–98, so placed as to be free from snow. The lowest temperature reached was 13.6° below zero. In the winter of 1898–99 the experiment was repeated, and the record when read the following summer showed 17.6° below.

COMPRESSED AIR has been applied to the pumping of water, the power supplied by a gas engine, which drives an air compressor, the discharge of which is led alternately to two closed vessels. During the time that the air is being forced into one of them the other is being filled with water, which is in turn forced out by changing over the flow of the compressed air, the change being made automatically.

FOUNDRYMEN in a big way find it economy to employ the services of a chemist to insure a uniform character of the iron used. Where large quantities are used the idea in many instances is to keep on hand a stock from which to supply a mixture which will not exceed .09 sulphur and not fall below 2.75 in silicon, nor below 3.25 for total carbon; phosphorus, say from .60 to 1.10; manganese, from .40 to 1.00.

CONSUL HUGHES sends the following from Coburg: "A. Reis of Antwerp has patented the following method for preventing incrustation in boilers: A mixture of sugar, tannin extract, silicate of potash or soda and boric acid is added to the boiler water to keep the salts in solution; when the water attains a density of about 15 to 25 Be, the boiler is blown off. The working periods range from a fortnight to three months, according to the quality of the water in use. Glycerine and alkaline sulphates are sometimes used in the mixture."

A CEMENT for stopping leaks in steam pipes was given in the issue of Feb. 10, 1900. A Lead, S. D., correspondent says a manganese cement is in some respects better. It is composed of four parts black manganic oxide, ten parts litharge, five parts red lead, five parts unburnt limestone and five parts yellow ocher. Pulverize, mix well, knead into dough, add a little boiled linseed oil and asbestos fiber.

EXTRALATERAL RIGHTS of lode locations were incorporated in the mining laws of the province of British Columbia for eight years and abandoned, the results tending to disprove the idea that the nature of the Pacific coast mineral deposits requires the grant of the extralateral right to mining locations. This extralateral right exists only in the United States and Bolivia, and is a heavy expense and incubus.

A TELESCOPE can be used with a photographer's camera to take a picture of an object far off, but the result is rarely satisfactory; to arrange for the picture the eye piece of the telescope and the lens of the camera should be taken out, and then fit the opening into camera where the lens was upon the end of the telescope where the eye piece was, thus making the object lens of the telescope the camera lens.

AN applicant at a U. S. land office to secure timber land must swear to a non-mineral affidavit. He must take oath that he knows the conditions of the land at that time by personal observation; that the land is not occupied by any person or persons; that there are no mining claims, lodes or mineral deposits, to his knowledge, on said land. Coal, salines and coal oil claims on a tract of land exclude it from entry as timber land.

IN addition to the "long ton," the "short ton" and the "metric ton" of metallic commerce is the "shipping ton" of pig iron, which contains 2268 pounds. That weight, though obsolescent, is still allowed by railroads as a weight in shipping iron. The shipper who forwards 100 tons of pig iron is entitled to load 226,800 pounds on his cars. The extra 28 pounds in the pig iron ton over the long ton is to allow for sand adhering to the metal.

TURQUOISE in this country comes mainly from New Mexico, whose mines were elaborately illustrated and described in the issue of March 6, 1897. Recently turquoise of value was reported from Mojave county, Arizona, and also from Lincoln county, Nevada, where stones of marketable value are reported to have been found in mica schist at the foot of Sugar Loaf peak, some of the specimens weighing from thirty to sixty carats.

STRONTIUM SULPHIDE is thus prepared: An intimate mixture of 285 g. of commercial strontium carbonate, 62 g. flowers of sulphur, 4 g. crystallized sodium carbonate, 2.5 g. salt, 0.4 g. bismuth subnitrate is placed in a crucible, covered with a layer of coarsely powdered starch, and submitted for five hours to a bright red heat, then allowed to cool very slowly for one hour. This results in a white, friable mass with phosphorescent power.

"A 10% GRADE" means a rise (or fall) of 10 units of length in a distance of 100 of the same units of length, the rise (or fall) being measured vertically, and the distance horizontally. If the unit of length is 1 foot, a 10% grade means a rise (or fall) of 10 feet in 100 feet; in the same way it may mean a rise (or fall) of 10 rods in 100 rods, or 10 miles in 100 miles. A 10% grade in feet to the mile would be a vertical rise (or fall) of 528 feet in each mile of horizontal distance.

IN a submarine electro-contact mine the firing pins on the case containing the explosive, instead of exploding the charge when brought in contact with an object, act as a switch by closing one opening in an electric circuit. Another switch is located in this same circuit at a station on shore, so that in order to fire the mine it is necessary to close the land switch at the same time that one of the pins has been driven in by the hull of a vessel. If this is not done, no explosion takes place.

THE electrical conductivity of aluminum is 63% that of copper. The weight of copper is 3.33 times that of an equal volume of aluminum. The Standard Electric Co. of San Francisco have been making extensive experiments as to the tensile strength and general availability of aluminum for long distance transmission, and can doubtless furnish practical data. The longest continuous copper wire in use, so far as "Concentrates" knows, is the telegraph line of the Canadian Pacific Railway Co. from Montreal to Vancouver—2,897 miles.

RAWHIDE ROPE has great flexibility and, having comparatively few strands, is able to stand internal and external friction, as there no small yarns to chafe and break. Its most frequent use is for dynamo drives and where small sheaves are necessary. Its great elasticity causes considerable whipping and it is difficult to make a splice hold. Its first cost is considerably more than that of manila. Under ordinary circumstances and conditions, at a speed of 2500 feet per minute 1-inch rope will satisfactorily transmit 12 H. P.; 1½-inch rope, 26 H. P., and 2 inch rope, 48 H. P. The durability of the rope must be kept in sight as well as the actual transmitting power. The average life of ropes of medium size is about four years, though small ropes under unfavorable conditions have to be renewed annually.

The Terlingua Quicksilver Mining District, Brewster Co., Texas.

Written for the MINING AND SCIENTIFIC PRESS
by H. W. TURNER.

The Terlingua district lies about 68 miles in an air line southwest of Marathon, which is the nearest point on the Southern Pacific Railroad. By the present wagon road it is about 85 miles from Marathon, but this road can be made about 10 miles shorter at small expense. The mines are on the mesa west of Terlingua creek and are in a Cretaceous formation, called by Prof. Robert T. Hill of the United States Geological Survey the Caprina limestone. All of the cinnabar deposits so far as exposed are in this limestone. Whether or not the deposits will be found in the beds underlying the limestone is at present a matter of pure speculation, which can be determined only by future mining operations. Since the thickness of the limestone by the Rio Grande about 11 miles south of the mines is 1500 feet or more, it is probably that thick at the mines, as it is the very top of the formation in which the ore is now found. Up to the present time nearly all of the ore has come from surface workings, or shallow shafts, and the size of the ore bodies in depth and the depth to which they will extend is another point to be determined by mining operations. It is certain, however, that the cinnabar comes from below—undoubtedly from a source beneath the limestone—and it is therefore more than probable that ore bodies will be found to a depth of more than 1000 feet, with a good chance of their extending still deeper.

Quicksilver Retort at Terlingua, Texas.

The cinnabar mines lie in a limited area about 2 miles wide by 4 miles long, but it is probable that the mineralized area is of greater extent—at least 3 miles wide by 5 miles long. The general trend of the main lodes is in an easterly and westerly direction. The quicksilver occurs in limited amount in the native form, but chiefly as the red sulphide of quicksilver or cinnabar. The limestone formation of the district contains numerous rusty brown veins. These, as above noted, usually trend in an easterly and westerly direction, but many of the smaller veins are extremely irregular and strike in all directions. These rusty brown veins are composed of calcite or crystallized carbonate of lime and oxide of iron, usually enclosing fragments of broken up limestone. Many of them show walls with striated and smooth surfaces, showing that movements have taken place along the walls, as is usually the case along mineralized lodes. In these veins or lodes the cinnabar occurs in stringers or pockets. Many of the veins show no trace of mercury, and even when cinnabar is present it often can not be seen on the weathered surface until the rock is broken, as it is black or otherwise discolored. The thorough prospecting of the veins is therefore a matter of time.

In addition to cinnabar, mercury occurs in the native form—notably in the McKinley lode—and as a white coating and as yellow-green crystals. Prof. S. L. Penfield has identified the white coating as calomel or mercury chloride ($Hg_2 Cl_2$), and the greenish crystals as an oxychloride of mercury, forming a new mineral species, for which I have suggested the name terlinguaite. In tunneling in on the vein of the Crœsus claim, a vertical cavity in the limestone was found, perhaps 50 feet in depth, lined by a dazzling white layer of saccharoidal crystalline gypsum, associated with some cinnabar. Calcite is present in nearly all of the brecciated lodes as veinlets, and it also lines cavities when it is often finely crystallized; occasionally seams of it are colored nearly black by manganese.

There can be no doubt that the so-called lodes are formed along fault zones. This is particularly evident with the larger lodes, where the brecciated character of the lode is plainly due to the grinding up of the rock between the walls during movements. Such brecciated fault zones form a ready avenue for solutions to rise from depths, and strengthens the assumption that the ore bodies would continue probably through the entire thickness of the Caprina limestone.

In the case of the small, irregular rusty veins, found at many points in the mineralized zone, it is quite likely that they will not extend with a definite dip to any great depth, although it is probable that these subsidiary irregular veins will be found at all depths through the limestone, but that they will be disconnected, or prove to be stringers from larger veins.

Prof W. P. Blake* has published the only satisfactory account of this new district. Prof. Blake noted pyrite in one of the lodes in addition to cinnabar and iron oxide, and interpreted the ferruginous breccia, forming portions of the lodes, as indicative of fissures along fault planes.

The difficulty in developing the district lies in the scarcity of wood and water. However, reservoirs can easily be built in the rocky ravines, the limestone being suitable for burning lime for cement, as well as for building dams. The chief firewood is mesquite.

About 1000 flasks of quicksilver have thus far been produced, this amount having been reduced in five retorts. One of the companies is now putting up a furnace, and the production next year will undoubtedly be large.

---

New Steel Syndicate.

The Crucible Steel Co. of America is the name of the new steel syndicate just organized at Pittsburg, Pa. It is the outgrowth of a consolidation scheme which was promoted by the Union Trust Co. of the city named. The capital stock issue is $50,000,000, being one-half preferred and one-half common stock. The new company proposes to take over the plants and assets of thirteen steel concerns at the aggregate purchase price of $19,000,000, the plants and equipment to be paid for in stock in the new concern, the material on hand to be paid for in cash. The following are the names of the steel concerns to be absorbed by the new syndicate: Park Steel Co., Pittsburg; Singer, Nimick & Co., Pittsburg; Howe, Brown & Co., Pittsburg; Crescent Steel Co., Pittsburg; La Belle Steele Co., Alleghany, Pa.; Anderson, Du Puy & Co., McKee's Rock, Pa.; Cumberland Steel & Tin Plate Co., Cumberland, Md.; Burgess Steel & Iron Works, Portsmouth, O.; Benjamin Atha and Illingworth, New Jersey; Spalding & Jennings Co., New Jersey; Sanderson Bros. Steel Co., Jersey City; Beaver Falls Steel Co., Pennsylvania; Aliquippa Steel Co., Pennsylvania. The new company was organized under the laws of New Jersey, but is to have its home office in Pittsburg.

The consolidated concerns belong in the main to that class of steel makers who are furnishers of drill and crucible tool steel and such stock as is usually used in shops that make mining machinery. Many of them do other classes of work, but the above constitutes a leading feature. This is mentioned by way of distinguishing them from such as the Carnegie and Bethlehem Works, which make a specialty of Harveyized armor plate, heavy shafting, structural work and ordnance material; and from the Illinois Steel Co. and the Colorado Fuel & Iron Co., whose great specialties are material for railway equipment and steel structures.

◆

World's Production of Copper.

The following from official and private statistics shows how completely North America surpasses other countries in the production of copper. It shows, also, that the production is hardly equal to the demand, for, in spite of increased prices, production in 1899 advanced only 9% over 1898:

	1898—Tons.	1899—Tons.
Algeria	50	......
Argentine Republic	125	65
Australasia	18,000	20,750
Austria-Hungary	1,540	1,505
Bolivia	2,050	2,500
Canada	8,040	6,732
Cape Colony	7,060	6,490
Chile	24,850	25,000
Germany	20,085	23,460
England	550	550
Italy	3,435	3,000
Japan	25,175	27,560
Mexico	15,668	19,335
Newfoundland	2,100	2,700
Norway	3,615	3,610
Peru	3,040	5,165
Russia	6,000	6,000
Spain and Portugal	53,225	53,720
Sweden	480	520
North America	239,241	265,156
Totals	434,329	473,818

◆

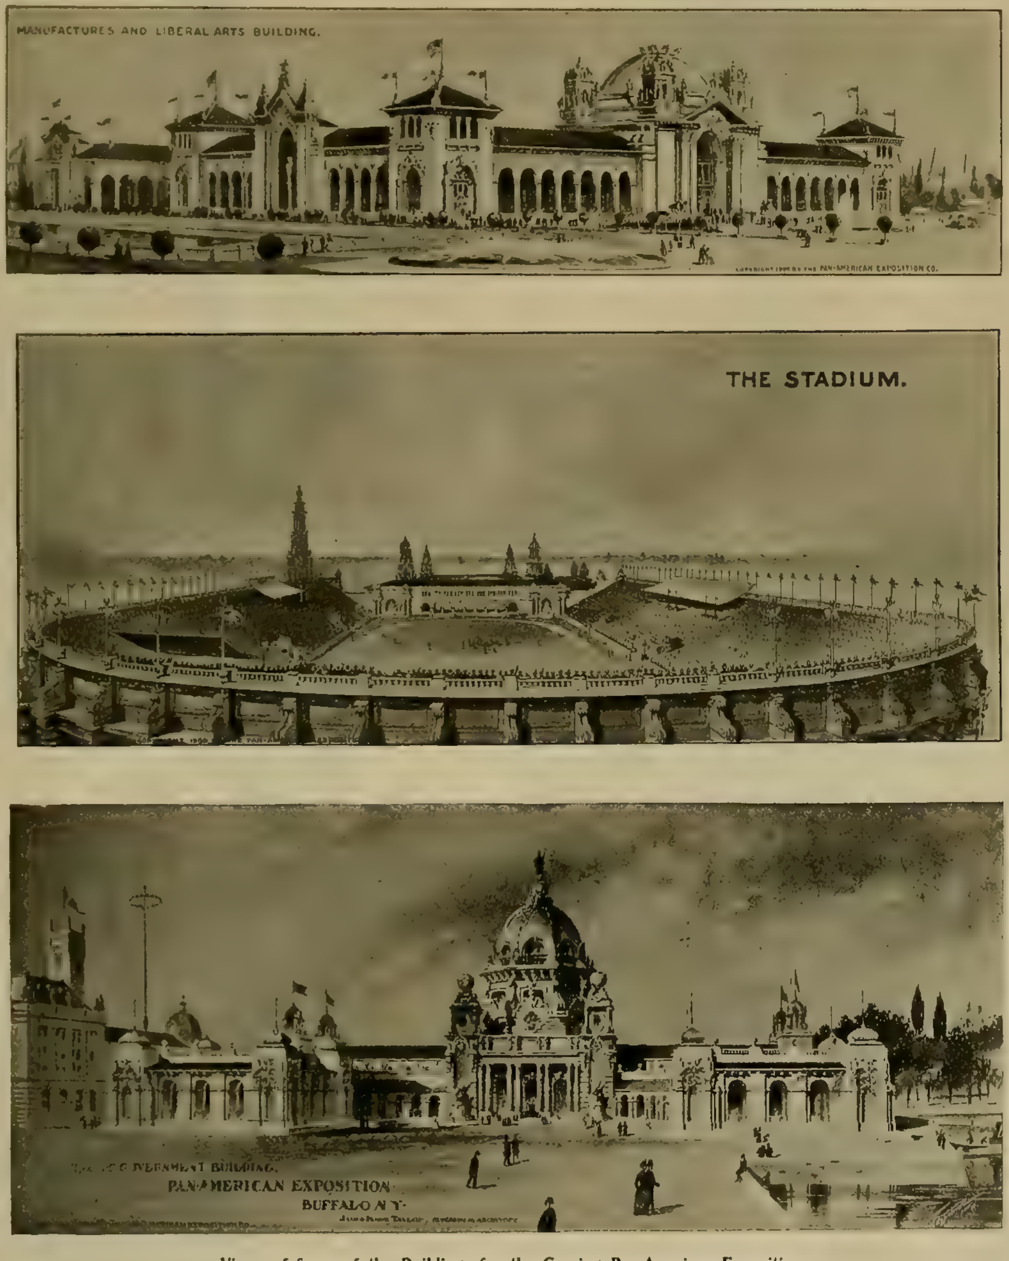
THE great denudation of the Colorado river, carving out of rock a series of canyons about 500 miles long, in one place more than a mile deep, with a multitude of tributary chasms and gorges, is held by some to be due to the slow rising of an ancient lake bed. At first the Colorado river and its tributaries, or some nameless ancestor of these, sweeping over the slowly rising surfaces, planed them down in most relentless fashion, and then began wearing out broad, shallow stream beds. But the country rose more rapidly, and the water had to cut deeper channels in

Hydraulic Work on Grounds of Mecca Gold Placer M. Co., Breckenridge, Colo.—(See page 70.)

the rocks in order to get out and away to sea. Owing in part to the wear of the water itself, but more to the ceaseless bombardment of the suspended sand which it bore from the up country, or picked up as it went along, and to the thump of pebbles and boulders which it swept on in flood-time, the river kept cutting down as the strata rose until finally, when what was left of the inland sea bottom was thrust up so that, towering far above its erstwhile rocky shore, it had to be called a plateau, the Colorado and its auxiliaries being at the bottom, a series of colossal canyons and gorges.

The Pan-American Exposition.

The greatest industrial display on this side of the world for some years will be the Pan-American Exposition to open in Buffalo, N. Y., in the early part of next year—the first of the twentieth century. As the name indicates, the ruling motive in the affair is the promotion of mutual feeling and interests throughout the countries of the American continents by joint participation in a grand display of the products of all honorable activities.



MANUFACTURES AND LIBERAL ARTS BUILDING.
COPYRIGHT 1900 BY THE PAN-AMERICAN EXPOSITION CO.
THE STADIUM.
GOVERNMENT BUILDING.
PAN-AMERICAN EXPOSITION
BUFFALO N Y

Views of Some of the Buildings for the Coming Pan-American Exposition.

The effort has received the full sanction of this Government, and it becomes, therefore, a national invitation from the United States to all other American States. There is every indication that the undertaking will be strikingly successful, and the preparations now rapidly advancing are upon a grand scale. The grounds cover 350 acres and the site is pronounced by landscape architects to be among the most beautiful in the world. There will be erected more than twenty large buildings and massive architectural works, besides the numerous State and foreign buildings, buildings for special exhibits, public comfort and other purposes. The buildings will all be abundantly filled with the most curious and interesting exhibits, representing the latest and best achievements of the civilization of the Western Hemisphere.

So vast is the number of valuable and interesting objects for exhibition in the possession of the United States Government that none but a building of great proportions could possibly contain them. Instead of one building, however, at the Pan-American, the Federal group will consist of three massive structures connected by colonnades. The main building of this splendid architectural triad will be 130 feet wide and 600 feet long. The others will each be 150 feet square.

The Stadium, or amphitheater, will have a quarter-mile track, and a sufficiently large space inside of this for any of the athletic games. There are provided seven exits, of sufficient breadth and height to admit, in case of need, the largest vehicles or floats, as it is proposed to use the Stadium for certain pageants, exhibits of automobiles in operation, etc.

The building devoted to Manufactures and Liberal Arts is one of the largest buildings of the Exposition, covering more than four acres. The western frontage is 350 feet and the northern is 500 feet. An important feature of the work is a spacious central court, 134x176 feet, containing a large room, where a fountain imparts an expression of life to the scene. The mining and manufacturing interests of this west half of America will doubtless be fittingly represented.

As Told in Colorado.

"I've got a sight for you that may interest you," said Lewis Emery, Jr., to the guest who had penetrated to room 412 at the Brown Hotel this morning.

"This is my son, Earle C. Emery," he added, as he unlocked one of the stout "grips" that stood on the table. "We are just getting back to our home in Bradford, Pa.; we are in the oil business there, but out in Calaveras county, Cal., we deal in this.".

As he spoke he undid one of a number of stiff buckskin sacks which he had taken from the valise and poured out on a piece of paper about a pint of gold nuggets ranging in size from the dimensions of a pea to those of a butter bean.

"We've got lots of this coming," said Mr. Emery, cheerfully, "but it will take some time and money to get it out. Our diggings are away above the sea level—2400 feet, in fact—and our sluicing water comes down to us from a height of 4000 feet, and it costs money. That is due to the debris bill that was passed through the influence of the farmers by the California Legislature. But still it pays, and there's a world of it to be done.

"Why, the diggings of 1849 and 1850 were as nothing in comparison. The California placers have hardly been touched, sir, hardly touched; but capital is going in there, and they will be touched, good and hard, too."—Denver, Colo., Post, July 10.

Wet Steam.*

WILLIAM H. EDGAR.

Wet steam is produced from two different causes in the boiler, priming and foaming. Priming is due to lack of delivery surface or lack of steam space and to the mechanical construction of the steam dome, especially the connections between the different domes in water tube boilers. But wherever such a mechanical defect might exist, the water you might say would spatter the steam if boiler water contained salts of soda.

Foaming is caused by saponification, due to the soda contained in the water, and as a rule whoever is using river water containing mud will have more or less soda in the form not only of a carbonate but of a sulphate. Well waters have tendency to foam after running a week or two. I believe that in ninety cases out of a hundred the moisture in steam is due to saponification or to the presence of soda. There might be a great excess of lime and magnesia in solution in feed water, but when the water is introduced into the boiler and brought into contact with that degree of heat, lime and magnesia is thrown out of solution into suspension, and consequently get no action whatever in the way of foaming. It does not increase the density of the water. It is not a part of the water. It is not in solution. Soda always remains in solution. Ninety per cent of the waters throughout the country used in the boilers contain considerable lime and also some soda, and nine plants out of ten are treated in one way or another with some one or the other salts of soda, and get the same action in all such cases received from the use of artesian well water and surface well water in certain places where the soil contains sulphate of soda and generally the carbonates.

It is essential to get as dry steam as possible, and one could get absolutely dry steam if he could use a straight mineral cylinder oil without requiring the admixture of any animal oil whatever. The animal oil is necessary only to take care of the water. The condensation washes off the mineral oil, necessitating the compounding with an animal oil to hold it, to give it the clinging, adhesive, film-cutting properties of a good cylinder oil.

On the Burlington road they condemned the oil and sent it back repeatedly month after month just during the last couple of years—in fact the last year—and could not buy anywhere else except of one company, and they had considerable difficulty in getting an oil to meet their requirements. They finally reached about 35% of tallow in the compounding. They were using soda ash in the boilers, and the more soda ash they used the more moisture they had in their steam, the more they saponified the water and the more moisture was carried over, and with this moisture came soda, and the more soda that came over the more it cut the animal oil, saponifying it, forming soap, and they had considerable difficulty before they found out really where the trouble lay.

I believe that throughout the country in different plants a great many good cylinder oils have been repeatedly condemned, and all due to the well water used carrying the water a little too high in the boiler or using some preparation of soda; and, of course, the higher you carried the water, and the more you agitated the water from a sudden opening, I suppose, of the valve in the delivery of steam, the more readily it would foam, and I believe that in all your practice in the engine room if you would watch your water level and the nature of your water, so as to know the amount of soda it might contain, it would enable you to take better care of the oil question.

Caustic soda in a saturated solution would contain 59% of caustic soda; a saturated solution of soda ash would contain 40% soda ash, when it would begin to cake; with salt you would have a 35½% saturated solution before it would cake. All sodium salts remain in solution until the solution is saturated, and then they cake and always cake at the hottest part of the boilers. It is quite common in Kansas and down in New Orleans and out in the Hawaiian Islands and along the sea coast where they use salty water to buckle the tubes and bag their sheets, due to salt. I believe that nine-tenths of the wet steam and cases of foaming are due to soda.

---

* Condensed from a paper read at the Northwestern Electrical Association Convention, June 26-28, 1900.

Cable Line to the Philippines.

Being in the Philippines to stay, and owning the Hawaiian Islands, the United States naturally needs telegraphic communication. Cable lines across the Pacific are being discussed. Advocates of a government line are figuring on two routes. The southern, by way of Honolulu from San Francisco to Manila and Guam, would, it is calculated, cost about as follows:

9285 knots cable, including 10% slack	$11,583,030
500 knots spare cable	623,750
Two cable ships ($200,000 each)	600,000
Two sets cable gear	250,000
Six stations	180,000
Duplex instruments, battery, etc	60,000
Spare instruments	30,000
Traveling expenses, freight, etc	100,000
Contingent fund	250,000
Duplicate cable	11,583,030
Total	$25,259,810

ANNUAL EXPENSE.

Interest at 3% on $25,259,810	$ 750,794
Maintenance and coal supply of two ships	250,000
Operating and traveling expenses	175,000
Repair and renewal fund	400,000
Total	$ 1,582,794

It is thought that the northern route by way of Alaska to the Philippines, and in addition thereto a separate line from California to Hawaii, could be laid for about $12,000,000, as indicated in the following table:

	SINGLE.		DUPLICATED.	
Route.	Miles.	Cost.	Miles.	Cost.
International cable, U. S. to Asia	4,883	$4,000,000	8,876	$6,000,000
Same, with cable to Hawaii	7,283	6,500,000	12,276	9,200,000
American, northern, to Philippines via Alaska, with branches to Japan and separate cable to Hawaii	9,335	9,000,000	12,735	12,000,000
American, southern, via Hawaii and Guam	7,750	13,500,000	14,250	25,000,000

This difference in cost is largely due to difference in length of the links. The arguments against such a route are to be found in the great natural difficulties to be encountered—ice, fog and great depths, but a cable on the northern route could be repaired at any time of the year on any link, except during temporary storms, and the cable ship could always find a harbor within 100 miles of any break. By the northern route the different stretches vary but slightly in distance, and are all comparatively short, none exceeding 850 miles, so that, in case of a break, one cable ship, if it were found impossible to make repairs, could easily relay one entire stretch, the cost of which would not amount to more than $600,000.

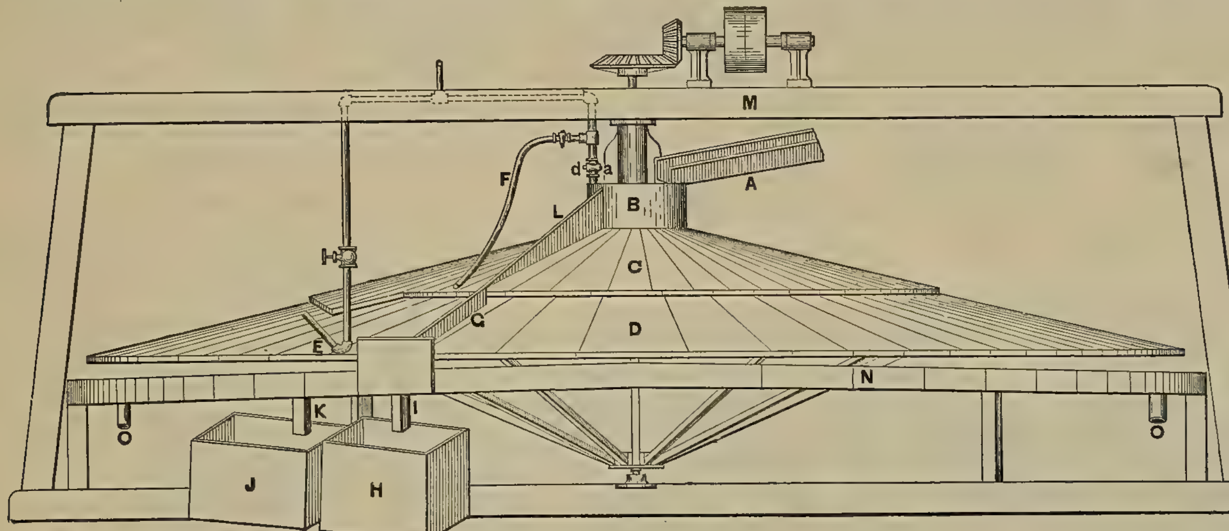
On the southern route, with its four great stretches of 2286, 1254, 2593 and 1496 miles, the cost of a break in great depth, in case repair were possible, would probably amount to several hundred thousand dollars, with the likelihood also of a necessity for the renewal of an entire stretch, which would cost from $2,000,000 to $3,000,000.

Another consideration is the supply of gutta percha, which has become so scarce and its price consequently so high that its use in construction of long distance cables has become very costly. Gutta percha costs $2 a pound; rubber can be had at $1.30. For long stretches of 2000 miles or more gutta percha, however, is requisite as insulating material, while for shorter stretches india rubber suffices.

The question of Pacific cable communication will be one of the foremost ones concerning the United States in the first years of the twentieth century.

The Evans Slime Table.

The Evans copper slime table and concentrator is a device herewith illustrated and described, as furnished by Fraser & Chalmers of Chicago. A is a launder to conduct the slimes from the catch pit or slime box to the distributor B, which has a partition a, to separate the clear water from the puddled water or slime water. The clear water is supplied by pipe d, to the distributor, and runs over one-half of the table D, while the slime water runs over the other half, being controlled by the division piece L. The sand and water being on one side of distributor B run through its perforated bottom, and are distributed equally over one-half of the stationary head C, and run on the rotating table D into the circular launder N, then through the waste pipes O O; the ores remain on the upper part of table D, and after concentration are shielded from the action of clear water by the cone-shaped head C. The proper grades of ores are, through the action of clear water, washed about half way down the rotating table D. They then come in contact with the diagonal perforated pipe E, and are rewashed by a succession of small jets from perforations of small pipe. The ore passing between the jets is carried around on the rotating table D until it comes in contact with a jet of water from pipe F and conducting board G. The jet F conducts the ore into hutch H, through pipe I. The middle or second grade ore is washed off table D by the perforated pipe E, and is deposited in hutch J, through pipe K, to be rewashed. The head C is suspended from frame M so that it can be readily adjusted relatively to the table as may be required. The arms and segments should be made of hard pine, about half seasoned. The sheeting or surface should be of soft pine, and must be green lumber and perfectly clear. The surface of table must be true and uniform, the width of the boards not to exceed 5 inches, tongued and grooved. The speed of machine is one revolution in eighty seconds; pitch or incline of table, 1¼ inches to 1 foot; pitch of head, 1¾ inches to 1 foot. The capacity of the machine is stated to be twenty-five to thirty tons per day of twenty-four hours.



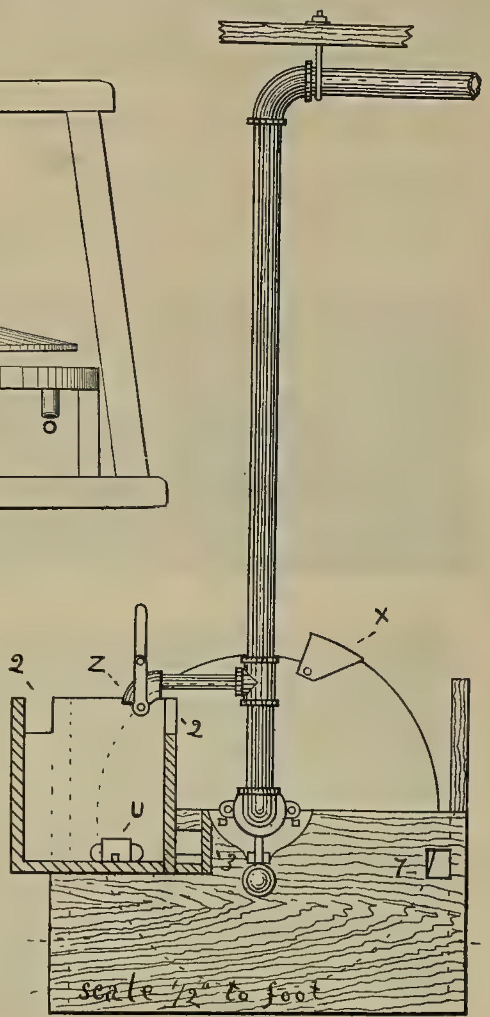
Evans Slime Table.

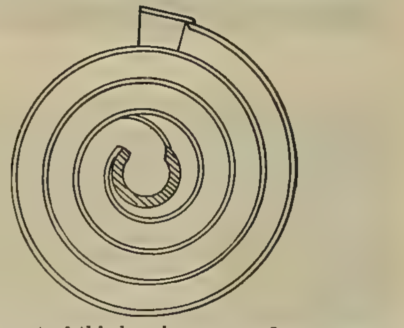
THE Congress of Mines and Metallurgy at Paris, France, during the latter part of last month, was inadequately represented by American delegates, though the prominence and utility of American methods were manifest in their mention by the several speakers. "Employment of Electricity in Mines" was the subject of an article by J. Libert, Director of Mines at Namur, Belgium. Wolfgang Wedelin of Berlin read a paper on "Electricity in the Mining Industry." "Mechanical Extraction of Coal" was described by various delegates, largely from American observation. Herrman Wedding of Berlin read a paper on "Magnetic Separation of Iron Ores," describing the Edison and Wetherill processes. M. Smits of Dusseldorf gave a further description of the Wetherill process. N. Pallati of Sardinia read a paper on the "Mechanical Preparation of Ores" in that country. M. Syznan-Krowsky of St. Petersburg submitted an article on "Russia's Mineral Resources," and Jas. Douglas of New York presented some statistical returns of the United States for 1899. There was some discussion as to the value of mathematics to mining engineers, and a resolution to hold the next meeting at Liege, Belgium, in 1903, was unanimously carried.

OFFICERS of the Colorado State Federation of Labor are arranging to lease from the State a large amount of coal and mineral land, on which mines will be opened on the co-operative plan.

Spiral Sand Pump.

Frenier & Son, Rutland, Vermont, make a spiral sand feed, of which two views are herewith presented, the smaller showing interior construction of pump.





In the box is a pump wheel with its shaft supported on each side by bearings bolted to box. At the upper part of this box is an overflow opening to let off all the mud and worn-out sand which rise to the surface. This overflow opening is connected to the waste water drain or sewer of the mill.

The wheel is made spiral-like, consisting of a hollow passage or groove which starts from the outside, where it forms a scoop, and is coiled round and round until it reaches the center. The shaft of the wheel is hollow and open on one side, which connects with the spiral groove in the center of the wheel. The outer end of the shaft is connected with a detachable hollow, tapering shaft, which works in a packing box, preventing the sand from coming in contact with the shaft. The vertical pipe is connected to packing box by elbow. The pipe is 3 inches diameter for the 6-inch and 8-inch pumps and 3½ inches for the 10-inch pump. It connects at the top to a distributing box. Valves are connected to this box to cut of the supply. The pump wheel is made of steel plate, $\frac{3}{16}$ inch thick, and is made in three sizes, 6, 8 and 10 inches in width and 44, 48 and 54 inches in diameter.

These spiral sand pumps are designed for pumping sand, slimes, tailings and crushed ores. J. A. Frenier & Son are represented by M. S. Hauser, 12 Front street, San Francisco, Cal.

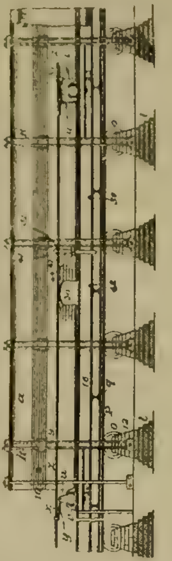
THE new engines of the Denver & Rio Grande Railway have iron pipes extending along the roof of the cab, connecting with the boiler. Through this pipe, without making a perceptible motion, either the engineer or fireman can send, under 200 pounds pressure, a jet of steam and boiling water that would effectually kill or injure anything living that happened to be on the tender or the front end of the baggage car. The blow-off cock thus arranged is expected to prevent train robbers climbing over the tender.

Mining and Metallurgical Patents.

Patents Issued July 10, 1900.

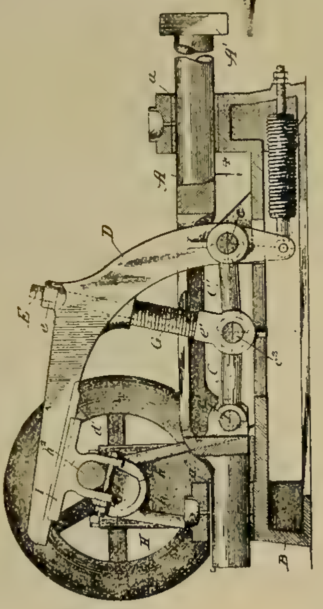
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE ROASTING FURNACE.—No. 653,202; P. Argall, Denver, Colo.



An ore roasting furnace, combination, reciprocating hearth or bottom, means for reciprocating same, series of hollow rabble arms extending transversely across movable hearth or bottom at definite intervals, rabbles fixed upon rabble arms, crank arms on ends of rabble arms, horizontal rods extending the whole length of furnace on each side, adjustable link connections between rods and crank arms, and means for moving rods, whereby all rabble arms are simultaneously moved and rabbles thereby lifted from the ore.

ACTUATING MECHANISM FOR CONCENTRATING TABLES.—No. 653,285; D. Cole, Chicago, Ill., assignor to the Gates Iron Works, same place.

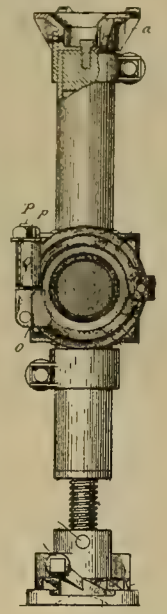


In machine of class described, combination of reciprocating bar, frame or base portion in which bar is reciprocatingly mounted, pivotally connected toggle links, one fulcrumed at one end upon base portion and the other at other end to reciprocating bar to reciprocate same by and during their vibrations, an operating lever pivotally mounted upon frame portion at one fulcrum point of the toggle links, pitman pivotally secured to toggle links at pivot connection thereof and having threaded end portion passed through smooth perforation in operating lever, adjusting nut on threaded outer end of pitman, extensible spring washer surrounding pitman and inserted between it and operating lever, crank shaft and crank rotatably mounted in frame portion, shoe pivotally mounted upon crank and having its saddle engaging with slide on operating lever, and spring secured to operating lever and frame portion to assist in vibrating operating lever in one direction.

PROCESS OF EXTRACTING COPPER OR OTHER METALS FROM TAILINGS OR ORES OF SUCH METALS.—E. Fink, Milwaukee, Wis.

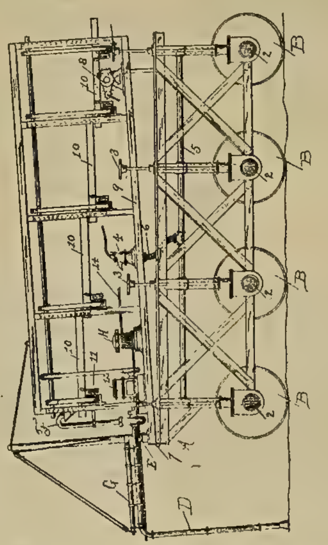
Process of extracting copper from tailings or ores containing that metal, subjecting tailings or ore alternately to action of solution containing sulphuric acid and primarily compound of nitrogen, capable of liberating nitric oxide, and to action of higher oxide or oxides repeatedly reproduced by supplying air or oxygen under pressure to liberated nitric oxide and to higher oxide or oxides which have been reduced by acting on tailings or ore and are confined in presence of solution until metal contained in tailings or ore is dissolved in solution, then separating matrix or earthy matter from solution, and finally separating and precipitating copper from solution.

DRILL-SUPPORTING COLUMN AND COLUMN CLAMP.—No. 653,307; W. K. Millholland, Chicago, Ill.



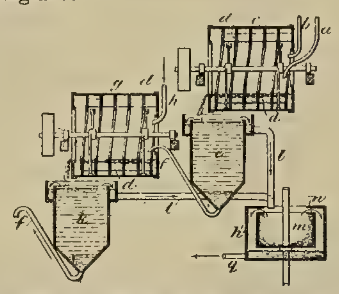
In column for rock drills and the like, in combination, shaft, foot block, screw fixed in block and entering shaft end, boss formed on block and having face tangential thereto, foot plate upon which screw is adapted to rest and turn, annular ratchet formed on upper face of plate, abrupt faces of ratchet teeth being on planes radial as to ratchet, and pawl secured to tangential face of boss and co-operating with ratchet.

PLACER MINING DREDGE.—No. 653,205; S. K. Behrend, Washington, D. C.



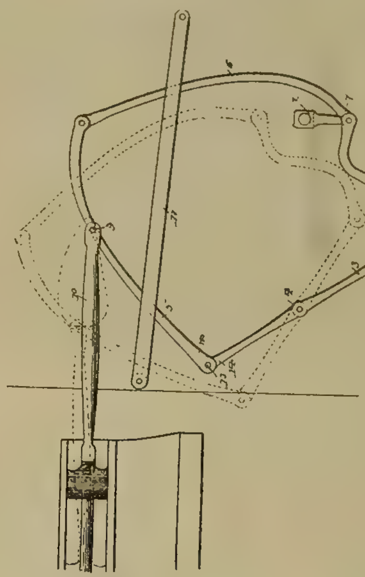
Combination with hollow rollers, of platform having horizontally hinged connection with rollers and dredge carried on platform; truck constructed and adapted for support directly upon water bottom whereby truck is upon fixed and immovable support, of platform carried by truck and capable of vertical adjustment with respect thereto.

APPARATUS FOR SEPARATING METALLIC FROM ROCKY CONSTITUENTS OF ORES.—No. 653,340; F. E. Elmore, Leeds, England.



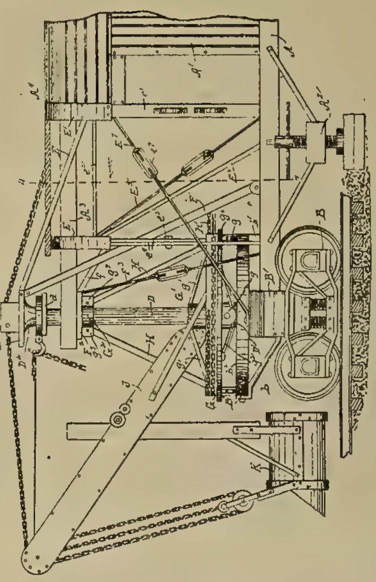
Combination in apparatus for separating metallic from rocky constituents of ore, of rotary drum having internal helical ribs divided into cells by longitudinal blades, pipes for delivering oil and ore and water into one end of drum, water-subsiding vessel arranged below drum and receiving oil, ore and water therefrom, centrifugal drum arranged below water-subsiding vessel, and constructed with inwardly projecting lip and surrounding casing, and pipe for conducting metallic portions and oil from top portion of water-subsiding vessel into centrifugal drum at point in proximity to inwardly projecting lip thereof.

DEVICE FOR OVERCOMING DEAD CENTERS.—No. 653,257; J. Martin, Howard Lake, Minn.



Combination of crank, the curved link 6 pivoted at its inner end to outer end of crank, lever 3 fulcrumed between its ends and disposed opposite link 6, the short sigmoidally bent link 2 connecting one end of lever with outer end of crank, long, slightly curved link 5 disposed opposite link 2 and connecting other end of lever with outer end of link 6 and pitman connected with one of the links.

STEAM SHOVEL.—No. 653,391; W. Mullen, Elizabethtown, Pa.



Combination with movable platform, of crane on platform, arch extending transversely of platform and located behind crane, vertical post supporting one end of arch, struts supporting other end, second arch parallel with and located behind first arch, horizontal braces connecting ends of two arches, horizontal brace beam supported by both arches and having upper end of crane post secured thereto, braces connected with second arch and extending to platform, brace connected with top of crane post and extending to second arch, diagonally disposed braces connected with upper end of crane post and with first arch and diagonally disposed braces connected with upper end of crane post and with platform, all braces being so disposed as to permit jib of crane to swing under end of first arch unsupported by post.

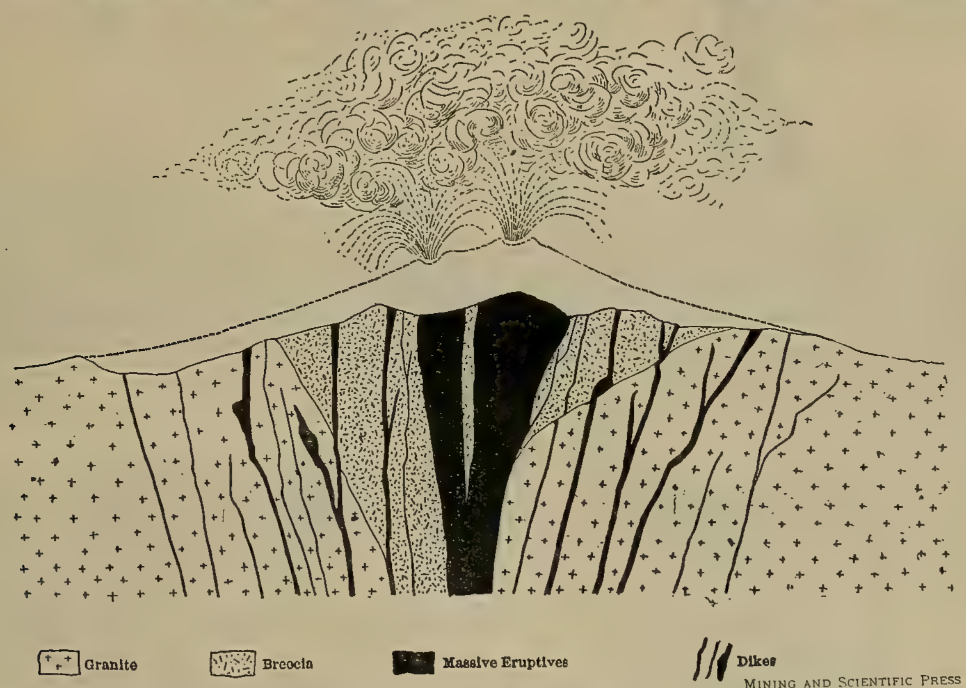
PROCESS OF EXTRACTING PRECIOUS METALS.—No. 653,325; C. P. Tatro and G. Delius, Seattle, Wash.

In extracting precious metals from ores, process comprising following steps: pulverizing ore to fine pulp; dissolving metals from foreign matter by immersing pulp in bath comprising aqueous solution of common salt, caustic lime, and small percentage of bromine fluorspar and saltpeter; recovering precious metals from bath by electrolytic action.

The Cripple Creek Volcano.*

NUMBER II.

Projectile discharges were succeeded by tranquil emissions of lava. The bodies of massive andesite in the southeastern part of the district may represent such extrusions. They were marked by an absence of the violence which accompanied the earlier outbursts, due, perhaps, to a diminution in the quantity of escaping steam and a lessening of the pressure upon that which remained. The earlier ejectamenta of a volcano are scoriaceous and vesicular; that is, they have been penetrated and torn by the explosive escape of superheated water vapor, while the lava characterizing the later stages of activity is compact and homogeneous. The creation of a vent serves as a safety valve in releasing the tremendous pressure of the steam, due to its sudden expansion when coming into contact with incandescent fused rock. Attendant upon the relief given to that pressure, are all the terrifying phenomena of the first outburst. Subsequently the force of the eruption diminishes. The lava ceases to be violently projected by escaping high-pressure steam. The underground waters near the conduit have become used up. The rise of the lava underground, followed by its protrusion at the surface, becomes a quiet process, which must be referred to a more deep-seated cause, namely, the local readjustment of the earth's crust, causing the fused rock to ooze out slowly. Many lava streams have a glacier-like movement. They seldom progress more than 3 miles per day, and often require a year to advance a few miles. Observers have described the flows of lava which follow the first eruption as welling out "with the tranquility of a water spring," as "proceeding in silence," as "being effected quietly and without noise." All this is in vivid contrast to the paroxysmal outburst which marks the first stage of volcanic activity. The difference is to be referred to the relative quantity of steam taking part in the process of eruption.



IDEAL SECTION OF THE CRIPPLE CREEK VOLCANO.

The period of quiet may have been, and probably was, succeeded by a complete, though temporary, cessation of activity. This interval may have persisted for several hundred years. Geology is lavish of time. The inaction was due to the diminution of pressure consequent on the withdrawal of the lava in the conduit of the volcano. Such a result would be brought about by the shifting of the center of eruption to another place along the line of fissure. The first conduit of the Cripple Creek volcano became plugged up by material which had failed of ejection. Other minor vents may have been formed on the flanks of the mountain which had been slowly formed by the long continuance of discharges. When, after an interval, a vigorously active condition was resumed, the second eruption, in all probability, took place through a new vent, produced, as the original one had been, by a fissuring of the rock immediately over congested masses of steam due to the water which had accumulated during the interval of inaction.

There is evidence indicating that the Cripple Creek volcano had several vents. One existed near the present site of the Hull City placer; another must have been situated near Anaconda. The original position of the orifice of an extinct volcano can be inferred from the composition of the rocks. The lava which cools rapidly in the open air assumes the charater of a glassy substance, containing only a few embryonic crystals, but that which cools slowly underground, and while still subjected to great pressure, is developed into completely crystalline rock. Experiments with smelter slags, and a microscopic examination of the resulting material, have confirmed this proposition. In this way the lava streams which have issued from the vent are distinguishable from the material which has solidified in the throat of the volcano. The nepheline-syenite near the Lillie and Vindicator mines is the granular equivalent of the phonolite which occurs so plentifully all over the district. The phonolite and the syenite have a similar chemical composition, but their texture is very different. This is due to the fact that in the former a crystalline structure has not been fully developed, but the ground mass or matrix, as seen under the microscope, being made up of crystallites—minute, hair-like bodies without the properties, but with the tendency to become, crystals. This indicates that the rock cooled too rapidly to permit of proper crystalline growth. The nepheline-syenite, on the contrary, is made up entirely of developed minerals, no part of the original ground mass having failed of arrival at true crystalline maturity; so that even the slight excess of quartz, though uncombined, presents a crystalline structure. This indicates that the rock cooled very slowly, giving ample time for the full play of the forces which produce crystallization. It is to be inferred that the nepheline-syenite fills an old vent, or is close to it. The same inference is drawn from the patch of syenite-porphyry between Gold hill and Squaw gulch. Further evidence suggestive of the former existence of a vent thereabouts is afforded by the steepness of the plane of contact between the granite and breccia on the adjoining Guyot hill. The dissection of extinct volcanoes in other parts of the world, a dissection brought about by natural erosion, which has cut valleys right into the flanks of ancient eruptive centers, furnishes numerous examples confirming such deductions as have just been made with reference to the vents of the Cripple Creek volcano.

The bulk of the material thrown up by the Cripple Creek volcano was fragmentary, and became the great mass of breccia now constituting the leading geological feature of the district. The earliest lavas extruded were of medium fusibility: namely, andesite, and then phonolite. On reaching the surface, they formed streams, the exterior of which became promptly chilled to a black-looking slag, to which escaping steam gave a cindery structure. The lava rolled down the slope of the volcano with the utmost slowness, making clinking sounds such as are heard when the workmen empty the slag pots over the dump of a smelter. Such lava streams weather very easily; the exterior, by the contraction of the surface due to cooling, becomes porous, and water penetrates into the mass of them, disintegrating them so that they are readily carried away by the rains of spring.

The last extrusions of the Cripple Creek volcano were of basalt. These were more limpid, and must have formed streams which traveled much farther than the less fusible phonolite and andesite. The basalt, judging from the behavior of similiar lava flows actually observed in the Hawaiian Islands and elsewhere, would progress rapidly down the slopes of the mountain and overwhelm the forests which, probably, clothed the lower portions of the Cripple Creek volcano, setting them on fire and adding greatly to the aspects of destruction presented by the scene. Upon cooling, these basaltic flows would be cleft asunder by symmetrical series of cracks forming prismatic columns grouped like the pillars of a Gothic cathedral. But where they were not protected by a later covering of rock, the ruthless hand of decay attacked them also, the frost of many thousand years shivered the straight columns; and the freshets of spring swept the remnants into the torrents which fed the Arkansas river.

The successive periods of activity in the life of the Cripple Creek volcano are marked by the sequence of lavas extruded. This sequence is indicated by structural relations, the older extrusions being penetrated by the younger. But this is not all. The crystalline structure and the chemical composition of the rocks resulting from the cooling and consolidating of the successive lavas exhibit differences which have been found to be closely analogous to those presented by similar successions of rock at other volcanic centers, both in the United States and in Europe. The earliest lava extruded by the Cripple Creek volcano was andesite. Then came the phonolite, and, lastly, the basalt. These three rocks represent types which vary in their chemical composition and in their consequent fusibility. Basalt fuses at about 2250° F.; certain varieties fuse at about 2000° F. What is usually termed a "white heat" is equivalent to a temperature of 2100° F. The least fusible rocks are of the granite and trachyte class; they fuse with difficulty at about 2700° F. To the intermediate type belong the andesites, which fuse at about 2500° F. The relative fusibility of these rocks is dependent upon the fusibility of their chief constituent, feldspar, the variety in the basalts being labradorite, the most fusible of the feldspars. Moreover, in basalt there is present a good deal of augite, a still more fusible mineral, and a large percentage of iron which, as in smelter slags, contributes directly to fusibility. The trachytes are largely made up of orthoclase, the least fusible of the feldspars. The andesites are intermediate in composition and of medium fusibility, their characteristic feldspar being oligoclase.

This fusibility used to be expressed in terms of "acid" and "basic character," the rocks high in silica and low in iron being at one extreme, those low in silica and high in iron at the other. But Dana has pointed out that this does not express it correctly, fusibility being dependent not so much on the percentage of silica as upon the amount of alkali, namely, potash and soda. Thus the rocks rich in alkaline feldspars are the most fusible. Free quartz exists in most rocks; and the percentage of it, which is far from uniform among the members of any particular type, increases the acid character of the rock, so that it becomes a secondary factor in determining fusibility. Similarly iron occurs as an oxide (magnetite) in all rocks, to an insignificant degree in the granites, but in the basalts and gabbros freely, so as to form an important ingredient, giving them their dark coloring. This large percentage of iron contributes to easy fusibility; indeed, certain basalts are known to become so limpid that they can be taken up in a spoon attached to the end of a cane.

This question of fusibility would be of slight importance were it not for one interesting fact, namely: it has been observed in several volcanic regions that lava of intermediate extreme types, namely, the very alkaline or comparatively non-alkaline rocks, such as basalt and rhyolite, respectively. This was the case at the Cripple Creek volcano. It has been inferred from these facts that in the earlier stages of volcanic activity the lavas are mingled together underground, and that during the period of eruption the heavier portion separates from the lighter, causing two diverse products to be separately emitted.

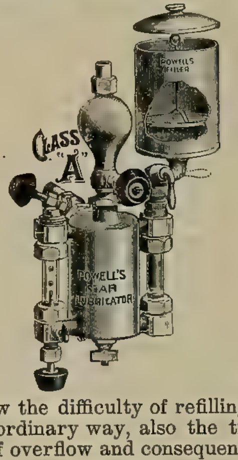
(TO BE CONTINUED.)

---

*Condensed from a paper read at the Washington meeting of the A. I. M. E. by T. A. RICKARD.

The Powell Filler.

The accompanying illustration shows Powell's filler in position attached to their Class "A" lubricator.



Engineers know the difficulty of refilling a lubricator with oil in the ordinary way, also the time required, the liabilities of overflow and consequent waste of oil, besides messing everything in the act, especially if the oil is thick or heavy. The Wm. Powell Co., Cincinnati, O., claim that by the use of the Powell filler all this trouble and annoyance is done away with. An illustrated circular explaining in detail the operation and economy of this useful device will be sent anywhere upon request.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—(The following is from an old and experienced California miner):

We arrived on the 18th. Have traveled faithfully every day; have been up the Snake, Cripple and the Piney rivers and many of their tributaries, also on Dexter, Snow and many other creeks. I find very little doing anywhere, excepting on the beach, and most of the men for 20 miles whom I have talked with declare they are not earning over $3 per day. There are a few exceptions, no doubt, doing well.

On Anvil creek there are not over fifty men working, owing to scarcity of water; only about ten men working on Lane's claims, below discovery; not a man working on Snow gulch, although there is rich gravel on the gulch. I panned out one pan that yielded about $1. Lane's claim at the head of Snow gulch will no doubt turn out well when he gets water, which will have to be pumped.

All of these creeks are very flat. Usually three men shovel into the sluice and two men shovel out, and it has to be rich to pay.

There are just two things possible to save the reputation of this country: the tundra, of which there is little or nothing known, and the dredging of the beach below high tide, which no one has yet done. Yet there are several who say they are going to try it. There is any quantity of machinery strewn along the beach for miles. Much of it will never be used nor even taken away. I do not think any man can judge fairly of this country in twelve days, but I feel like advising my friends to stay away for the present. Things are very much mixed—no law, no security of titles. So far it is a town boom, pure and simple.

Nome, July 1.

At Sumdum the Bald Eagle and Sumdum Chief consolidated into the Sumdum Chief M. Co.; H. T. Tripp, manager. A two weeks' run of the 10-stamp mill milled fifty tons each day, yielding $19 per ton. Ore is partially blocked out by the tunnel, which, cutting both ledges, is 3500 feet long; its end is 1600 feet below the surface.

At the Bauer mine at Sitka a 4-stamp mill is being put in.

Supt. Nevens has 102 men on the payroll of the Juneau-Alaska mine.

The steamship Noyo, fourteen days from Cape Nome, arrived at San Francisco on the 18th, confirming former reports therefrom. Many are leaving; some prospectors are scattering out; more are hanging around waiting for something to turn up. There were seven new cases of smallpox reported the day before the steamer sailed.

ARIZONA.

COCHISE COUNTY.

At Pearce the Commonwealth will rebuild the mill, recently burned—a 50-stamp mill, capacity 200 tons a day. The company's loss in the recent fire was $200,000.

From the Peabody mines, 9 miles from Cochise station, two carloads of ore are being shipped daily. The mine is operating two hoists and employing forty men.

The Turquoise mine, south end of the Dragoons, is shipping a carload of copper ore daily through Cochise station.

Supt. H. B. Clifford of the Dragoon M. Co. is working 100 men on the company's mines at Johnsonville and has copper ore.

At the Great Western Copper Co.'s mine twenty men are at work.

R. A. F. Penrose, Jr., manager Pearce mines, Pearce, will put in new material and machinery to continue work on the property. The fire burned 150 feet in the shaft. It is estimated the loss will be $200,000.

MOJAVE COUNTY.

Chloride reports a discovery of silver ore in the 90-foot tunnel of the Redemption mine, belonging to R. J. Ferguson & Sons. The ore body is 2 feet thick. Native silver permeates the width of the ore body; there are also black sulphites, copper, iron and lead.

PINAL COUNTY.

The Arizona Copper Hill M. Co.'s properties are on the west side of the Canyon del Oro, 20 miles from Tucson. They have driven a 700-foot tunnel on one of the claims, and are putting in a gasoline hoist with intention of sinking a vertical shaft 500 feet.

The company developing the Geiseman copper group in the Catalinas, east of Oracle, have a body of ore 20 feet wide.

R. Leatherwood is chloriding the Apache copper mine, on the San Pedro side of the Catalina mountains.

YAVAPAI COUNTY.

The new 40-stamp mill of the Octave M. Co. is in operation.

Fourteen miles from Jerome the Eclipse is to be developed. The 5-stamp mill has produced gold to the value of $6300.

A million-dollar fire in Prescott on the 15th destroyed five blocks in the business portion of the town. There was no loss of life and the burned district will be rebuilt.

The old Crook mine, in Crook canyon, under the superintendency of W. Mendenhall, is being developed. About 200 tons of ore have been milled at the Pickerel mill on the Hassayampa with good results; mill runs will be made until the property is in shape to have its own equipment.

A railroad will be built from Seligman to Hillside. C. Timmons of Kingman has charge of the engineering department. J. Lawler is the heaviest owner of the Hillside mine.

CALIFORNIA.

AMADOR COUNTY.

At Sutter Creek ten stamps of the South Spring Hill mill are running on ore from the 500 level of the Lincoln, testing the new ore body found at that point.

The Record gets the following from Supt. Voorheis: - The result of milling 1100 tons of ore from the Lincoln mine was:

Free gold, 182.69 ozs. at $17 oz...	$3,105 73
Sulphurets, 39 tons at $77.51, assay value per ton............	3,022 89
Loss in tailings, 53 cents per ton..	583 00
Total value 1100 tons..........	$6,711 62
Average value per ton........	6 10

The same mill has started running on another lot of 1000 tons of this rock.

BUTTE COUNTY.

Doyle, Petkin & Levy of Nevada county have bonded of Adams & Achern, Clipper Mills, a tract which embraces placer and quartz properties.

CALAVERAS COUNTY.

The Golden Gate mine, near Angels, is to have a 5-stamp mill.

The Ford mine, near San Andreas, is temporarily closed to retimber the shaft.

EL DORADO COUNTY.

The Eagle G. M. Co., near El Dorado, has made its final cleanup for the season, paying about $100 per day for the time it was worked.

At the Ribbon Rock mine, Placerville, the shaft is 215 feet deep. Drifts are being run north and south on the ledge.

The ten stamps at the Omo mine are crushing ore from tunnel No. 3.

Development work on the Cincinnati mine, south of Placerville, is still being vigorously prosecuted. Six men are now employed, who are rapidly driving the tunnel ahead. The company have a 12-foot ledge and are very much pleased with the outlook.

Fifteen men are drifting in the French Hill Seam Diggings.

C. W. Kenney is sinking the shaft of the south extension of the Schleger mine, near Greenwood.

The Big Canyon mine has closed down.

INYO COUNTY.

Mining Review: The Ratcliffe Co. at Ballarat have closed down their mine, the main reason given being that their ore could not be handled by amalgamating and cyaniding processes, and that it will be necessary to put in a smelter.

KERN COUNTY.

In McKittrick district, the Royal Union Oil Co. incorporated June 17th; on the 18th derricks were built and machinery shipped; on the 25th drilling commenced; on the 1st of July oil was struck at a depth of 400 feet; the company, not being satisfied, the well was cased and drilling continued. The well is now down 800 feet in oil sand.

The Monarch Co., at Sunset, has a flowing well at a depth of 460 feet.

The Central Point has the deepest well in that locality at 750 feet, containing nearly 450 feet of oil sand.

MARIPOSA COUNTY.

At the Mariposa mine the shaft has been sunk 595 feet. Work on the east drift at the first level was stopped at 390 feet to prevent interference with the work on the shaft and lower levels.

MONO COUNTY.

In the Standard Con. mine at Bodie, for the week ending July 7: Ore crushed, 212.5 tons; average assay vanner tailings, $11; concentrates produced, .60 ton; assay value, $56.86; amalgam produced, 780 troy ounces; value per ounce, $3.09.

NEVADA COUNTY.

The Blue Gravel M. & M. Co. is incorporated; H. C. Stillwell, T. S. Irwin, W. Kolman, L. Legarde, P. Campbell; capital stock, $50,000.

A new 10-inch pump has been installed at the Champion mine.

PLACER COUNTY:

H. F. Calenberg is Supt. at the Jupiter gravel mine, Iowa Hill. He reports the outlook favorable.

Wm. Muir, Supt. Boston & S. D. M. Co., Michigan Bluff, has forty-three men at work.

The South Yuba Water Co. will raise the dam at the Summit valley reservoir 25 feet, giving additional capacity of 150,000 gallons.

PLUMAS COUNTY.

W. T. S. Kirk of San Francisco has bought J. A. Mayn's mine, near Cromberg, for $15,000. He expects to put men at work.

SAN BERNARDINO COUNTY.

H. M. Crowther tells the Tribune that on Gold mountain, purchased last season of E. J. Baldwin by J. R. De Lamar, is ore showing free gold, and great volumes in which to the eye there is no sign of gold. A $3 amalgamable ore will afford profit. The mines are 37 miles from the Southern California Railway. Labor is $3 a day throughout the region. In a few days the mill will start.

C. S. Corning expects to have his smelting plant at the Needles finished next September.

SHASTA COUNTY.

At the Mt. Shasta mine the shaft is 325 feet deep. Arrangements are being made to install machinery for working the mine on a larger scale.

The Gladstone mine has been sold to Roberts, McIntosh & Jillson, comprising the Hazel G. M. Co., who will put the mill in operation.

J. W. Parmelee at the Minnesota mine is working twelve men. The company is shipping to Keswick.

TRINITY COUNTY.

T. J. Loftus will put in a 30-ton milling plant at his mine on Coffee creek.

TUOLUMNE COUNTY.

The Banner M. D. Co. is incorporated; C. M. Belshaw, J. M. Castle, J. R. Phillips, F. M. Manson, C. J. Jones, V. Van Hal, J. A. Brent, G. Gates; capital stock, $200,000; subscribed $120,000.

W. L. McKinley, electrician of the Tuolumne Water Co., has started a 20 H. P. motor at the Golden Gate mine to operate the concentrators.

Rawhide proposes to have a wagon road to the line of the Sierra Railway.

At the Grand View gravel mine a flow of water occasions the installation of a 50 H. P. engine to run the 6 and 10-inch pumps.

The Kinkaid Flat gravel mine, near Sonora, has resumed.

The Starr King mine, now owned by Boston men, is being unwatered. Hoisting works and a stamp mill will be put in. Wm. Floyd is superintendent.

VENTURA COUNTY.

In Los Angeles, on the 20th, 6000 acres of oil land in this county were bought. Los Angeles bankers and oil men put in $250,000. Senator Bard has a one-fifth interest. The company is controlled wholly by southern California men.

COLORADO.

CUSTER COUNTY.

Silver Cliff reports that the Geyser mine has shut down, after steady sinking of its shaft for over fourteen years. The shaft has a perpendicular depth of 2650 feet, the deepest in Colorado. A general assignment has been filed to Supt. Elmendorf under the State law. The mine closed down July 4. The assignee has filed an inventory showing a gross debt of $65,000. Of this $25,000 is for labor, fuel and supplies. Assignee Elmendorf has filed a bond in the sum of $100,000. Reorganization may result. There has been expended on the property $2,000,000.

CLEAR CREEK COUNTY.

Idaho Springs reports the Franklin and Lady Franklin mines on Seaton mountain sold to the Colorado & California S. M. & M. Co. for $35,000. Work will be carried on through the adit tunnel. The same company has bought the Wilkie mill, and has taken charge of the Allen mill, which is being changed from a stamp to a concentrating plant.

Gazette: At the Empire City mine, Empire, the shaft is 200 feet below the tunnel level.——The adit on the Mint mine, Covode mountain, in 340 feet, has for two-thirds of its length a vein of mill stuff averaging about $10 per ton in crude value. The property is in operation under lease to Denton Bros.——The Gold Fissure at Empire proposes to sink a three-compartment shaft to develop their five claims by crosscutting from a central point.

DOLORES COUNTY.

A strike is reported at the B. & M. property, West Dolores, near Rico. The B. & M. property is owned by E. A. Thayer of Pueblo.

FREMONT COUNTY.

The United Oil Co., at Florence, has struck oil in well No. 231 at a depth of 2300 feet, in new territory.

The Florence Oil Co. has oil in a new drill at a depth of 2500 feet.

GILPIN COUNTY.

Supt. Jesup of the Gold Coin Mines Co. has suspended operations at the California and Hidden Treasure properties.

C. C. Reid is in charge of the Kountz & Ashley mine, at Phœnix, 2 miles south of Eldora. He has a number of men and will do considerable work this summer.

Cundy & Co., in the Fannie property, Cyclops hill, west of Blackhawk, have a streak of silver ore that carries values of 700 ounces silver per ton.

GUNNISON COUNTY.

A. McVey, president of the company owning the Black Queen mine, is at Crystal to consider a $50,000 concentrating mill. The Black Queen has ore running $30 a ton in gold, $30 in silver and copper. The mine is 17 miles from a railroad and is working forty men.

JEFFERSON COUNTY.

(Special Correspondence).—The Anna L. mine, 30 miles southwest of Denver, belonging to C. R. Critchell and associates, is being developed through a shaft which is now 135 feet deep. A body of ore about 4 feet wide has been encountered, which consists, in the main, of iron and copper sulphides, associated with which is metallic bismuth, said to run from 16% to 22%. The ore also carries fair values in gold and copper.

LAKE COUNTY.

In the Last Rose mine, near Twin Lakes, a vein in porphyry and granite, 20 feet wide, averages, where recently cut, 4% to 5% copper, with a little gold and silver. Streaks of azurite and malachite run from $60 to $100 per ton in gold, silver and copper. There are also some black sulphurets of silver. The main values appear to be in copper, of which there are a variety of compounds. The Last Rose mine is 8 miles from the old town of Dayton.

PITKIN COUNTY.

A silver strike is reported from Aspen in the A. J. mine, the ore shoot coming in on the eleventh level.

SAN MIGUEL COUNTY.

(Special Correspondence). — A proposition is before the county commissioners to build a wagon road from Telluride to Savage Basin which will be 6 miles long and cost $30,000. From Telluride to Savage Basin is an ascent of 2000 feet.

Telluride, July 16.

SUMMIT COUNTY.

(Special Correspondence).—The Augusta M. & M. Co., under the management of T. R. Griffith, recently took control of the old Juventa mine, on the south slope of Farncomb hill, and are driving a tunnel to cut the ore body at a point 400 feet below the workings, which consisted of a 400-foot shaft and considerable of drifting. The tunnel work has progressed about 175 feet, but it will be an 1100-foot tunnel when completed.

Ore shipments from the Breckenridge district run from 300 to 400 tons per month, whose values average about $35 per ton.

Manager C. A. Finding announced a cessation of work on the property of the Breckenridge Deep M. Co. on the 23rd ult., till such time as sufficient funds shall be provided to continue the work and carry it to completion. Present depth of shaft is 440 feet, from which a drift was run 310 feet deep in a fair-grade ore, carrying lead, zinc and iron, with values in gold, silver and copper. When work resumes it will be with the intention of sinking to the second contact.

G. H. Evans, M. E., well known in California, has the management of a group of properties owned by the Gold Pan, Fairview, Royal Blue and Oro Grande placer mining companies, which aggregate nearly 6000 acres of placer grounds in the valley of the Blue river. During the past few months these grounds have been pretty thoroughly prospected with drills, to ascertain the depth of material above bedrock and its value. Some sixty holes have been drilled at different points, ranging in depth from 15 feet at the rim to 70 feet in main channels. Six Evans hydraulic elevators will be put in, which are expected to handle 6000 yards per day. Orders will soon be given for 1100 tons of steel for 3 miles of pipe line, to be divided into three sections—the first to be 1 mile of 60-inch pipe for 400 feet pressure; the second to be also 1 mile, of 56-inch pipe, subject to 350 feet pressure; the third mile to be 52-inch, with 700 feet pressure. These companies—virtually one concern—are erecting a machine shop at Breckenridge at a cost of $20,000, which will be equipped specially for such work as is required in the district, and will include air compressor and electric generator.

The Mecca Gold Placer M. Co., under the management of Lemuel Kingsbury, owns about 200 acres of placer ground on the south side of French gulch, extending part way up Nigger hill to the company's two flumes, one taking water from the

Blue and the other from French creek. These grounds were worked in a small way for years by their former owners, by whom the value of the material was demonstrated. Under the present ownership and management, two hydraulic giants were set to work June 4, 1900, and have been kept busy day and night since, with the idea of getting in about five months work this season. Manager Kingsbury estimates that he handles from 700 to 800 yards per twenty-four hours with each giant. In the sluiceway below one giant there are 36 feet of triangular steel riffles and ¼-mile of riffled sluiceway below the other. Each giant works under a pressure of about 175 feet head of water. (See illustration, page 64.) Besides the water which passes down the sluices from the giants, there is a constant wash from small reservoirs, which fill and empty automatically by means of gates and traps. A special run of 600 yards of material from these grounds last year gave a mint return of $649.71. Near the bed of the gulch a shaft was sunk to bedrock—30 feet—within the past few days, the material from which was found to be extremely rich. A bedrock drift will be run several hundred feet from this shaft to determine further as to values.

The North American Gold Dredging Co., whose placer land comprises a large area on the Blue and Swan rivers, are now operating one Risdon dredger and two hydraulic elevators. Two of the lighter dredgers were sent to California several months ago and were replaced by heavier machines. The dredger in operation is said to be handling about 1800 yards per day.

The Peabody placer, on the Gold Run, on the north side of Gibson hill, is being operated by lessees.

The Uba Dam is being worked by a company, of which M. M. Howe is manager.

The Iowa, in charge of R. E. Norton, is now in operation.

Toney Bianchi recently made some shipments from a lode mine called the Carpenter Placers.

Some shipments are also made from the Gold Dust and Washington lease. The Johannesburg is sinking a shaft at a point higher up the hill. WASCOTT.

Breckenridge, June 27.

TELLER COUNTY.

The Post hears that the Portland Co. has bought the Thomas ranch, southwest of Colorado Springs, as a smelter site, and that a Denver firm is drawing plans for a 300-ton smelter.

W. R. Foley et al have bought the Keystone mine for $60,000.

The Laribee G. M. Co. will sink 500 feet on the Canyon City claim, on Straub mountain.

(Special Correspondence). — The Unexpected, under lease to S. McDonald, manager of the Strong mine, is attracting special attention by reason of the discovery of 8 feet of ore near the surface, which, it is asserted, averages two ounces gold in value.

Victor, July 16.

IDAHO.

BLAINE COUNTY.

The Minnie Moore, near Hailey, is sold to the Tustin Bros. of Kansas City and T. H. Moriarity of Hailey. The first payment has been made, and work will be begun immediately by the new owners.

ELMORE COUNTY.

In the Volcano district, Camas Prairie, a ledge at a depth of 125 feet shows ore. Supt. Clemens is in charge of the work.

At Rocky Bar four companies are operating in that vicinity; $100,000 has been expended recently in improvements. The Red Warrior has a 10-stamp mill and a cyanide plant. Six tons of ore a day is taken out to the man.

E. & M. Wilbur are working forty men at Rocky Bar. The company has a mill and cyanide plant. Mr. Taylor is in charge.

The Idaho M. & M. Co. is operating 10 miles above Junction Bar.

The Sawtooth Co., operating near the old Ophir mine, is milling ore. The work is in charge of E. T. Brockman. Fifty-two men are employed.

L. Vinton, manager Idaho Con. M. Co., operating placer mines near Atlanta, has the coarsest gold ever taken from ground along Boise river, some nugget size. This gold was taken from the Queen river placers. Operations will be continued at Queen river until winter. A supply of 5000 inches of water is available. The flume leading to the placers has a capacity of 1500 inches.

IDAHO COUNTY.

At the Little Giant mine at Warrens J. J. Bennett is Supt., who has the Iola mill, which he will increase from five to ten stamps. The price paid for the mine was $50,000.

"The first tellurium ever found in the State of Idaho" is reported discovered by P. H. Leach, near Grangeville, the ore running $90 per ton.

KOOTENAI COUNTY.

J. C. Huage, Supt. Park River G. & C. M. & M. Co., Trestle creek, near Hope, proposes to run a tunnel 1000 feet into the mountain, tapping the ledge at a depth of 600 feet. The work done so far shows 7 feet of copper-gold sulphide ore. The vein is covered by an iron cap.

OWYHEE COUNTY.

Avalanche: At the Cumberland the new shaft has a pitch of 77½° east. It has two 4x4 compartments. The new plant will be the largest and most complete ever installed in southern Idaho.——At the Red Jacket operations were resumed three weeks ago.——The Baxter Gulch Bonanza property is operated under bond by J. H. Hutchinson. L. Sorensen is in charge.

SHOSHONE COUNTY.

Wardner News: Grading for the Empire State flume on Pine creek is completed 5 miles. The contractors have 100 men in their employ. This flume will be 16 miles in length to Government gulch, where the water will be used to furnish power for use in the tunnel and for the concentrator to be erected. The flume will be 4 feet wide, 3 feet deep.

The Dobson Pass M. Co. has incorporated at Wallace; capital, $100,000.

WASHINGTON COUNTY.

Kleinschmidt & Stuart of Helena, who own the Peacock mines, near Weiser, operated by the Boston & Seven Devils M. Co., say the group has been tapped with the diamond drill to a depth of 900 feet and good ore found there.

MONTANA.

BROADWATER COUNTY.

Gold is reported in Confederate gulch, near Diamond City.

CASCADE COUNTY.

The Silver Belt M. Co., near Neihart, will work its claim near the Broadwater group.

DEER LODGE COUNTY.

Anaconda Standard: The complete returns of the net earnings made to the county assessor for 1900 by the different mining companies and mine operators are as follows:

Anaconda Co	$ 5,365,520
Boston & Montana	6,073,150
Butte & Boston	571,310
Colorado Co	142,580
Colusa-Parrot	325,045
W. A. Clark	1,545
John S. Harris, receiver	79,800
Silas F. King	715
Lexington Co	665
James A. Murray	600
Montana Ore Purchasing Co	400,000
Pat Mullins and others	2,500
Parrot Co	800,655
Speculator mine	92,185
Total	$13,856,270

FLATHEAD COUNTY.

The Pacific Northwest M. Co. has shipped thirty-five cars of concentrates from Libby to the smelters at Great Falls. The concentrates average about 60,000 pounds to the car. The company employs eighty-five men at the mine.

MADISON COUNTY.

The Pony Sentinel says Swanson & Co. have a lease and bond for $20,000 on the Manila and Sunrise claims. The ore assays $10 to $15 gold and 4% copper.

NEVADA.

ELKO COUNTY.

Secretary Airis reports that the Dexter G. M. Co., Tuscarora, during the year ending July 1 received $1435.64 from the sale of ore. From the sale of bullion $162,955.33 was received; cyanides brought $46,994.15; other receipts during the year were $5000 from the sale of the Chignon ranch and $545 from the sale of the Kinkead mill, together with accounts payable, making the total receipts from all sources $231,526.76. The mine expenditures for the same period were $100,421.07; expenses of running the stamp mill, $26,060.68; cyanide plant, $29,060.78; power plant, $9713.93, miscellaneous, $11,991.36; total, $167,738.55.

A 10-stamp mill and cyanide plant is approaching completion at Bull Run, 35 miles north of Tuscarora, 80 miles from Elko, Nev., the latter being the nearest railroad station. The ore is gold-bearing.

ESMERALDA COUNTY.

The reported sale of the Silver Peak mines to Jno. W. Mackey had no foundation. A deal is, however, reported on with an English company.

Siegal & Jackson, at Sodaville, are installing a cyanide plant for working the Stewart tailings.

HUMBOLDT COUNTY.

The rate on ore shipments from Oreana to Reno has been restored to the old figure—$5.50 per ton. A raise to $11 per ton was made by the S. P. Co. some months ago.

LINCOLN COUNTY.

As outlined in these columns a few weeks ago, the proposed consolidation of the April Fool and De Lamar mining companies at De Lamar is off.

WASHOE COUNTY.

The Con. Cal. & Va. M. Co. has $17,500 net proceeds of sale of concentrates to the Selby Smelting & Lead Works.

WHITE PINE COUNTY.

To develop the New Home mining claim and operate the Millick mill at Osceola, Nev., the Nevada G. D. Co. is organized in Salt Lake City; capital stock, $15,000; F. S. Luff, secretary and treasurer.

The Wilson Leaching Co., operating a cyanide plant on the tailings from the Wilson mill at White Pine, recently brought 200 pounds of gold slimes to Salt Lake.

OREGON.

BAKER COUNTY.

The Eagle G. M. Co., Cable Cove district, has contracted for the shipment of all its ores to the Selby Smelting & Lead Works of San Francisco. The company has shipped considerable ores in the past to the Northport smelter at Trail, B. C., but the latter company has always refused to pay for the lead.

The Red Boy mine reports a strike of gold ore 40 feet below the lower workings in sinking a winze. Godfrey & Tabor, the owners, say they will sink on the property to a depth of 2000 feet.

CROOK COUNTY.

At Ashwood the Oregon King M. Co. owns thirteen claims, developing them by a shaft 200 feet in depth and tunnel 350 feet long. Estimate placed on expenditures to date, $25,000. W. S. Thomas is in charge.

JOSEPHINE COUNTY.

Ankeny & Cook of the Sterling mine near Cole's have a second clean-up of 1270 ounces valued at $21,000. S. J. Fore, the superintendent, expects the mine to yield $50,000 for the season's run.

UTAH.

BEAVER COUNTY.

At the Imperial M. Co.'s property, near Frisco, Mgr. Lewis has eight samples averaging 18.5% copper, 5 ozs. silver and $1 in gold.

JUAB COUNTY.

Eureka Miner: The May Day management is shipping 500 tons of ore every month.——Manager McIntyre of the Mammoth and Manager Cunningham of the New East Tintic Railroad have an agreement that the proposed tramway will not be built. Mr. Cunningham will be paid in accordance with the past contract—30 cents per ton on ore and 35 cents for the up-hill freight—until Jan. 1, 1901. After that date a 5-cent reduction goes into effect.

SALT LAKE COUNTY.

The Dalton & Lark drain tunnel at Bingham will be 5800 feet, and will reach the vein under present workings at 1200 feet on the dip.

SUMMIT COUNTY.

The Constellation M. Co. will sell its property at Park City to Colorado Springs men for $187,500.

WASHINGTON.

The C. H. C. group, Silver creek, Summit mining district, is sold to G. H. Morgan of Watertown, N. Y., for $13,500.

CHELAN COUNTY.

O. R. Dahl, secretary Crown Point, on Railroad creek, reports an 8-foot vein carrying molybdenite, together with free gold, and "a dozen chunks of solid molybdenite averaging four pounds each." The company have carload orders for molybdenite from different Eastern firms.

CLALLAM COUNTY.

McKeesport, Pa., men propose to establish iron and steel works at Port Angeles, but the iron ore supplies will be obtained from the Barclay Sound district of the Alberni mining division of Vancouver island.

FERRY COUNTY.

At Keller, the old town being on ground which could not be patented, a new townsite is staked out one mile above and a patent secured. The old town people are preparing to move to the new town. In the Manila the ore averages 3% copper. Farr Brothers own the mine.

The Empire is bonded for $20,000 by Nichols & Norman of Spokane.

The Umatilla, one mile west of town, has been bonded for $70,000 to Eastern men. Ten men began work the 15th.

At the Dewey they are running the main tunnel to tap the ledge. The ore is black oxide and native copper.

The Justice has a ledge, 12 feet wide, of steel galena and assays well in silver and lead. It lies between two walls of granite. It is on Jack creek, 4 miles from Keller.

In the Humboldt, the company has money for development work.

The Legal Tender is being developed by A. W. Merk of Spokane.

The Congress Hill group is a nickel proposition and is ready to ship ore, as soon as the wagon road is completed to the mine. John Hopkins is Gen. Mgr.

LINCOLN COUNTY.

Moscow reports a strike in the tunnel on the White Cross at 310 feet from the mouth.

OKANOGAN COUNTY.

J. X. Jones, at Molson, is developing claims near Bolster, a new town.

SNOHOMISH COUNTY.

C. Campbell, manager Blue Bird mine, reports a body of ore in the lower tunnel at Darrington.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).--The Toronto-Lillooet G. R. Co., Ltd., has its reduction works completed and in charge of A. S. Additon. They will start up on the 16th. The plant is of fifty tons daily capacity and was furnished by the Union Iron Works and Pacific Tank Co. of San Francisco. The ore is arsenical pyrites, of which there is an abundance. Twenty-five men are employed.

Lillooet, July 5.

Low grade siliceous ore containing only a low percentage of sulphide is treated at the B. C. bullion extracting works at Silica. The mill was built to treat this class of ore by the Pelatan-Clerici process, on the Red Mountain railway, 3 miles southwest of Rossland. The mill is practically in two sections, the upper or crushing and sampling section, and the lower or treatment section. The ore is delivered in cars, are side-tracked, passing over a track scale, where they are weighed, to the receiving bins, which are under cover; the cars, returning, are weighed again. The electric current, as delivered, is 2080 volts to two motors, 50 H. P. An induction motor drives the crushing and sampling machine in the upper section; a 75 K. W. synchronous motor furnishes power for the lower or treatment section. The mill is lighted throughout with electricity by the use of two lighting transformers, taking the current from the power mains. All current consumed at the mill is paid for on the meter basis.

The treatment the ore receives in the first section is dry crushing. It is fed by gravity to a crusher, thence by carrying belt to a roll belted, thence carried by a second carrying belt to another roll geared, thence by a third carrying belt to a bucket elevator and raised 40 feet for sampling. The material leaving the last set of rolls will all pass a ¼-inch mesh screen, and a third of it a 30-mesh screen. The elevator delivers the material direct to a sampler, so set that one-sixteenth of the whole is retained. This is further reduced by passing it through another sampler, where one-sixth is cut out, giving a sample of one-ninety-sixth of the whole; this is the floor sample, quartered down by a corno. The ore rejected by the samplers falls from a hopper through three 6-inch iron pipes to three storage bins. The whole of the ore is easily converted to either of the three bins. The ore from the storage bins now enters what may be considered the treatment section of the mill, and is fed by two James automatic feeders to two 6-foot Bradley crushers driven from underneath, the crushing taking place on a steel ring inside, diameter 4 feet and 6 inches, outside 5 feet and 10 inches, with three rotary wheels, diameter 4 feet 7 inches, face surface 8 feet, weight 6475 pounds, making thirty revolutions per minute; depth of discharge 5 inches, screen area 2730 square inches, the tires being of prepared steel. The crushed product discharged varies considerably, depending on the character of the ore, and on the ratio of water to ore during crushing. When using a 60-mesh screen and crushing a siliceous ore containing from 4% to 6% of sulphide with such a quantity of water that the resulting sludge shall contain 50% of water, 90% of the ore will pass a 150-mesh screen, the remaining 10% a 100-mesh screen. But, on the other hand, increasing the quantity of water so that the sludge shall contain four times of water, 17% passed the 150-mesh screen, 12% the 100-mesh screen and 40% the 80-mesh screen, the remaining 31% remaining on the 80-mesh screen. Generally, in stamp mill practice, all that passes the 120-mesh screen is considered slimes; this, however, is not the case with ore crushed by this mill, as when a resource to wet separation is had, 40% of the product passing the 100-mesh screen is a good leachable product. The crushed material from this crusher passes direct to the four vats 9x15, where it was kept agitated until the C. P. vats are ready to receive a charge, which consisted of 2½ tons of dry material with 3¼ tons of water, which gives fairly thin pulp. The current for electrolysis used in the Pelatan-Clerici vats is a direct current generated by two dynamos, each having a capacity of 12 volts by 750 amperes. The switchboard is so arranged that each one of the twelve vats is on its own independent circuit, and in such a manner that the current generated by either of the dynamos can be connected with any one of the twelve vats.

The relative degree of the pulverization the ore has been carried to varies the chemical, electrical and their combined effects, especially when dealing with refractory ores. During the whole time of treatment agitation is kept up with the accompaniment of an electric current. To the sludge salt is added, varying between 5% and 1% of the weight of the ore in the sludge by degrees, the effect of the sodium chloride being first to increase the conductivity of the solution. The effect that takes place on the addition of sodium chloride to water brought between an anode and a cathode is that the sodium chloride in solution is disintegrated and reformed, and thus it becomes the intermediary by which, at the instant that chlorine gas and sodium are set free, the current is able to communicate between the electrodes.

During electrolysis, when the liquid contains only sodium chloride, the primary decomposition will be sodium at the cathode and chloride at the anode. To consider the action of these products of electrolysis as the sodium comes in contact with the mercury, a small portion will be dissolved by the mercury as amalgam, a portion with the water, giving $NaOH$ and H. The chlorine liberated at the anode, a small portion will attack the metal of the anode, the greater part be dissolved in the solution, some of which will reform with the $NaOH$ sodium chloride, another portion sodium hypochlorite $NaClO$ and water. The action of the chloride liberated and not engaged as above will to some extent attack the free gold and form $AuCl_3$, which is readily deposited by electrolysis on the mercury. The rest will attack the base metallic ore present in a finely divided state, when present, uniting with the metallic bases, the sulphur and arsenic being oxidized by the combined action of the chlorine and sodium hypochlorite into sulphuric and arsenic acids. These will again form with the sodium, sulphate and arsenate, with the consequent formation of free acids, which must be neutralized with lime before potassium cyanide is added.

With the addition of potassium cyanide it is advisable to have it in excess, not only to allow for oxidation, if any hypochlorite is present, but to allow the formation of cyanogen at the anode, which, being dissolved in the solution, will readily unite with the minutest particles of gold to form with the excess of potassium cyanide the double cyanide of gold and potassium. At the same time chlorine and cyanogen, both yielded at the anode, would form cyanogen chloride, which, in the presence of potassium cyanide, is effective in dissolving gold.

Owing to the high specific gravity of the sludge, arising from the character of the Rossland ore, the process finally adopted was close classification of the ore before treating with cyanide. For this purpose Wilfley tables were placed before the crushers. The sludge leaving these tables contains an excess of water. This is concentrated by the use of large vats of conical form, fitted with a valve at the apex of the cone. In these a concentration is effected, the ratio of water to ore being as 1 is to 1.

The concentrated sludge flows direct to the agitation vats, and on its way encounters a solution of KCN flowing in the opposite direction, and in this manner the sludge becomes well mixed with the KCN solution, of such a strength that, diluted with the water contained in the sludge, it will give—depending on the ore—a solution in the aggregate of a value of .08% to .15%.

After the charge has been agitated the required number of hours fresh slaked lime is added, the agitation being continued from five to ten minutes.

The exhausted sludge, together with the gold solution, flows into concentrating vats, and on its passage it is diluted to such an extent that the sludge entering the concentrating vats is of a consistence of 3 to 1. The discharge valve at the apex of these vats is kept shut until clear solution commences to flow into the discharge landers. The concentrated pulp is now allowed to flow to a second similar vat.

In this manner two-thirds of the gold solution is separated from the exhausted sludge by the first vat, and a further two-thirds by the second, according to the dilution that takes place between, respectively, the agitation vat and the first and second settling vats. Any desired quantity of the gold in the more or less diluted solution can be separated from the pulp.

The gold-bearing solution now flows to the Pelatan Clerici vats. The time to effect this is dependent on current and richness of solution. Six hours suffices to reduce a $4 solution to 7 cents per ton, with a current of 5 to 7 volts and 70 to 80 amperes.

The treatment of a siliceous ore assaying from 4.3% to 7% copper, a trace of lime and magnesia, 0.3 ounce gold, 0.5 ounce silver, gave a theoretical extraction of 94% of gold and 73% of silver. A pyritic ore—gold 0.8 ounce, silver 1.3 ounces, copper 1.8% and iron 22%—resulted in an extraction of 89.87% gold and 72% silver.

At Grand Forks, on the 13th inst., arrived the first ore-laden train from Phœnix at the Granby smelter—ten carloads (300 tons)—from the Old Ironsides mine. It is expected that as soon as the Canadian Pacific Railroad supplies additional ore cars the ore receipts at the smelter will approximate 600 tons daily. The ore bins of the Old Ironsides, Knob Hill and Victor contain 8000 tons, and there is an equal amount in the stopes awaiting removal. The Phœnix ores do not require any preliminary roasting in heaps, saving from 25 to 50 cents per ton in handling charges. A. B. W. Hodges is Supt. of the smelter.

Moyie has about 250 men at work in the St. Eugene group of mines. About sixty more are at work in the North Star mine at Kimberley and about twenty at work on the Sullivan. All these mines are shippers.

The first cleanup of the season from the Consolidation Cariboo, J. B. Hobson, Mgr., at Quesnelle Forks, was $135,000, the result of sixty-two days' work.

At Nelson, Supt. Gifford has been re-engaged as superintendent by the newly organized company, the Hall Mines M. & S. Co., Ltd. R. R. Hedley, former superintendent Hall Mines smelter, has been similarly advised by cable. The Hall mines and smelter have started up.

One hundred and thirty carloads of ore were shipped during June from the North Star and Sullivan mines, 20 miles northwest of Cranbrook.

The Silver King mine, near Nelson, will resume operations under the superintendency of J. R. Gifford.

Another crosscut tunnel has been started at the Vancouver mine, says the Silvertonian, which will be 700 feet—the longest crosscut tunnel in the district.

The B. C. Copper Co.'s smelter at Greenwood is expected to begin work on a 300-ton daily capacity October 5th.

Manager Rowe of the inchoate Quatsino coal mines, on the north of Vancouver island, has taken up from San Francisco a diamond drill to exploit the property.

The Cariboo Hydraulic Co. has completed its wash-up of the season with results stated to be satisfactory.

The Emily Edith Mines, Ltd., is organized to operate the Emily Edith mines, near New Denver; capital, £75,000; C. E. Hope local manager, J. D. Kendall consulting engineer. Four known ore-bearing veins cross the property of the Emily Edith Mines. No. 1 vein runs for 3000 feet horizontally. A shipment of fifteen tons gave 110 ounces of silver per ton, 46½% lead.

During June there were shipped from the Eugene mine at Moyie 1800 tons concentrates.

Ashcroft Journal: Sixty thousand pounds of powder was loaded this week at Ashcroft for the Cariboo mine. It will be exploded about Aug. 15th in a shaft and drift across the face of the bank above the workings of the mine, for the purpose of breaking down and shortening the high gravel bank.

MEXICO.

W. C. Lockhart, manager for A. W. Longley & Co., is in Hermosillo preparing to start work at the company's Suaqui Grande placer mines.

NEW SOUTH WALES.

The mining of New South Wales includes gold, silver, lead, zinc, copper, tin, coal, shale, iron, diamonds, opals, chromium, antimony, bismuth, platinum, limestone, cobalt, fireclay, scheelite and wolfram. The value of New South Wales' mineral output last year was £6,157,557—gold £1,751,815, silver, lead and zinc £2,070,657, copper £399,814, tin £98,428, coal and shale £1,325,798, coke £77,130, iron £77,130, diamonds £376,599, chromium £70,975, opals £376,599, antimony £190,621, platinum £1070.

THE KLONDIKE.

Free-milling quartz is reported between the head of Sulphur and Cariboo creeks, a tributary of Dominion. The vein is 6 feet wide, composed of quartz intermixed with manganese, honeycombed in character, shows leaching near the surface and carries gold.

Personal.

J. R. DE LAMAR has returned to Utah from Europe.

LOUIS JANIN has returned to San Francisco from Grass Valley, Cal.

HARTWIG A. COHEN has gone to Indian River, near Dawson City, Alaska.

E. L. BALLOU of Igo, Cal., takes charge of a milling plant at Pony, Montana.

W. S. STRATTON has given $25,000 to the State School of Mines, Golden, Colo.

S. K. THORNTON has returned to the Shenandoah, Cal., mine from San Francisco.

R. A. THOMAS is general manager of the Black Hills Copper Co., Jerome, Arizona.

H. VAN F. FURMAN of Colorado is examining mining property at Seward, Alaska.

W. J. SCOUTT, former manager of the Suffolk group, Ophir, Colo., is operating now at Rico.

R. J. CORY, Western manager for Edward P. Allis Co., has returned to Denver from the East.

G. E. BAILEY, manager Lewiston, Trinity county, Cal., cement gravel mine, is in San Francisco.

J. J. BROOKS has charge of the mill at O'Brien, Arizona, owned by the Saginaw L. Co. of Flagstaff.

S. A. KNAPP of Esmeralda county, Nev., is forwarding a local mining propotion in San Francisco.

G. M. FORD, who has been in Corea putting up mining plants, will return to California in September.

FELIX CHAPPELLET, Pres. Eureka Con. Drift M. Co. of California, is convalescent after a severe illness.

ROSS E. BROWNE has returned to San Francisco from giving expert testimony in Grass Valley, Cal, mining litigation.

J. D. LUDWIG, former superintendent Mariposa, Cal., grant, has returned from a six months' trip to Japan and China.

JOS. DEDRICHS, at Gold mountain, San Bernardino county, Cal., expects to start up the new mill at the DeLamar property next week.

H. C. HOOVER, a California mining engineer in charge of Chinese mines, cables from Shanghai that he has escaped from Tientsin and is safe.

C. A. PLATT, former foreman leaching plant Golden Gate, Mercur, Utah, mill, will have a similar position at the Republic Con., Republic, Wash.

J. P. LUDDY has resigned as foreman at the Golden Rule mine, Tuolumne county, Cal., to occupy the same position at the Mt. Jefferson mine, Groveland, Cal.

NEVADA'S Secretary of State, Howell, is in San Francisco organizing a company to develop copper properties in the southern part of Nevada near El Dorado canyon.

HENY JONES, former Supt. Golden Gate Extension, Mercur, Utah, has gone to Hailey, Idaho, to take charge of the development of mining property for Salt Lake parties.

C. D. HOYT, assistant assayer U. S. Assay Office, Helena, Mont., goes to Philadelphia to take a similar position in the mint. C. Hillman, second assistant melter, succeeds Mr. Hoyt.

S. F. EMMONS is in Salt Lake City, Utah, collecting data for the completion of the report upon the economic geology of the West Mountain mining district. He is assisted by J. M. Boutwell.

R. U. GOODE of Washington, D. C., geographer in charge of the Pacific coast section of the U. S. Topographical Survey, is in the Cœur d'Alene mining district, where two surveying parties are preparing the data for a topographical map of that section.

T. H. SIMMONS, formerly Supt. W. Y. O. D. and Empire mines, Grass Valley, Cal., has been appointed manager of some mines being operated in South Africa by the London Exploration Co. He left England for his new duties June 30th. The Union learns that the position carries with it a salary of $18,000 a year.

Commercial Paragraphs.

THE Medler, Arizona, Copper Co. have ordered a 100-ton concentrator from Fraser & Chalmers of Chicago.

F. W. BRAUN & CO. of Los Angeles, Cal., have bought a business corner in San Diego, Cal., for a branch establishment.

THE Edward P. Allis Co. of Milwaukee, Wis., have an order for a 120-stamp mill, with concentrators, to be erected at Dahlonega, Ga., this being the second mill of that size and description ordered for that district within the past year.

CHARLES C. MOORE & CO., 32 First St., San Francisco, now have the agency for Magnolia metal in all territory west of the Rocky mountains.

FLINT & LOMAX, Denver, Colo., who recently sustained a severe fire loss, are able to fill all orders in their line, and will be only temporarily affected by the disaster.

List of U. S. Patents for Pacific Coast Inventors.

653,431.—TRUCK—G. M. Williams, Santa Rosa, Cal.
653,634. — CAR BRAKES — S. F. Woodworth, Clipper Gap, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

POTATO CUTTER.—No. 653,385. July 10, 1900. J. E. Howell and W. A. Chamberlain, Montague, Cal. This invention is designed for cutting and slicing potatoes into forms for cooking, such forms being known as "French fried" potatoes. It consists of a table or support having surfaces at different elevations, one of such surfaces provided with a longitudinally extending slot, vertical and horizontal knives are secured to the surfaces, and a slide including end heads and connecting sides for an open center adapted to receive the potato to be cut. A bolt passes through one of the heads and the slot and a cover confined between the heads and sides is hinged at one end to hold the article in place. By pushing the holder back and forward the potato is repeatedly brought into contact with the cutting knives and is thus sliced or cut into any desired form.

ACETYLENE GAS GENERATOR.—No. 653,373. July 10, 1900. Chas. A. Bacon, Lockford, Cal.; assignor of one-half to Samuel Cohn, Stockton, Cal. This invention is designed for the economical production of acetylene gas from carbide of calcium. It comprises a generator with a succession of independent carbide containing boxes, a water tank with a rising and falling gasometer and connections between this and the generator whereby the gas is transferred from the generator to the gasometer. Means are provided for automatically cutting off the flow when the gasometer is full, and a means for automatically supplying water to the generator. A controlling cock is actuated by the rising gasometer so that the supply of water is cut off when the gasometer is sufficiently full of gas. There is a trap intermediate between the water supply and the generator, and a supplemental passage connecting said trap with the gasometer so that any gas produced after closing the valves will be admitted into the gasometer and the pressure upon the generator relieved.

Latest Market Reports.

SAN FRANCISCO, July 19, 1900.

SILVER—Per oz., Troy: London, 28¼d (standard ounce, 925 fine); New York, bar silver, 61¼c (1000 fine); San Francisco, 61½c; Mexican dollars, 48¾c.

The troubles in China are expected to occasion an advance in prices. The American Smelting & Refining Co. controls the supply of silver in the United States, but the price is fixed in London. The United Metals Selling Co. controls the sale of silver for export and domestic use.

The price of silver in India is reported 71¾ to 72¼. The small boom has been induced by a real demand combined with a temporary short supply, a great deal of the current business being purely speculative. All Mexican securities have advanced in sympathy with silver.

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.35; carload lots, 16.12½; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.00; Salt Lake City, 3.90; St. Louis, $3.95; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 8s 9d = 3.77½c per ℔.

The new prices made by the American Smelting & Refining Co., for shipment before August 1, seller's option, 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$3 95	$4 05
Chicago	3 95	4 05
Cincinnati	4 00	4 10
Pittsburg	4 05	4 15
Philadelphia	4 05	4 15
New York	4 00	4 15
Boston	4 07½	4 17½

On carload lots 5c. per 100 ℔s. higher.

The conditions of the lead situation are discussed at length on page 62.

SPELTER. — New York, $4.20; St. Louis, $4.05; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, pig, No. 2, foundry, $16.50; gray forge, $14.50; San Francisco, bar, per lb., 3c.

STEEL. — Billets, Pittsburg, $22.00; bars, $27.50; San Francisco, bar, 10c to 17c per lb.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $51.00 ⅌ flask of 76½ ℔s.; Export, $47.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21½c; San Francisco, Plumbers', 100-℔. lots, 18¼c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $34.00; San Francisco, ton lots, 34½c; 1000 ℔s., 32c; 500 ℔s., 35c; less, 36c; bar tin, ⅌ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.—San Francisco, crude, $17 ⅌ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, $125.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 33@35c ⅌ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 45@50c ⅌ ℔.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ⅌ set; 14 oz., 40s., 10½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

NAILS.—List prices per keg: No. 20d to 60d, wire, $3.70; cut, $3.70; 10d to 16d, wire, $3.75; cut, $3.75; 8d, wire, $3.80; cut, $3.80; 6d and 7d, wire, $3.90; cut, $3.90; 4d and 5d, wire, $4; cut, $4; 3d, wire, $4.15; cut, $4.15; 2d, wire, $4.40; cut, $4.40. Special rates on carload lots.

SMOOTH-ON CASTINGS.

TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

IT'S A CATALOGUE.

Our little ENGINEER'S RED BOOK is really our catalogue, though it is also one of the best vest pocket reference books for engineers ever published. It answers over 500 engineering problems and incidentally brings out convincing reasons why the

U. S. Automatic Injector

is better than any other.

Most engineers know this about the U. S. Injector, but the Red Book will tell them a good many things they don't know.

Can we send you one?

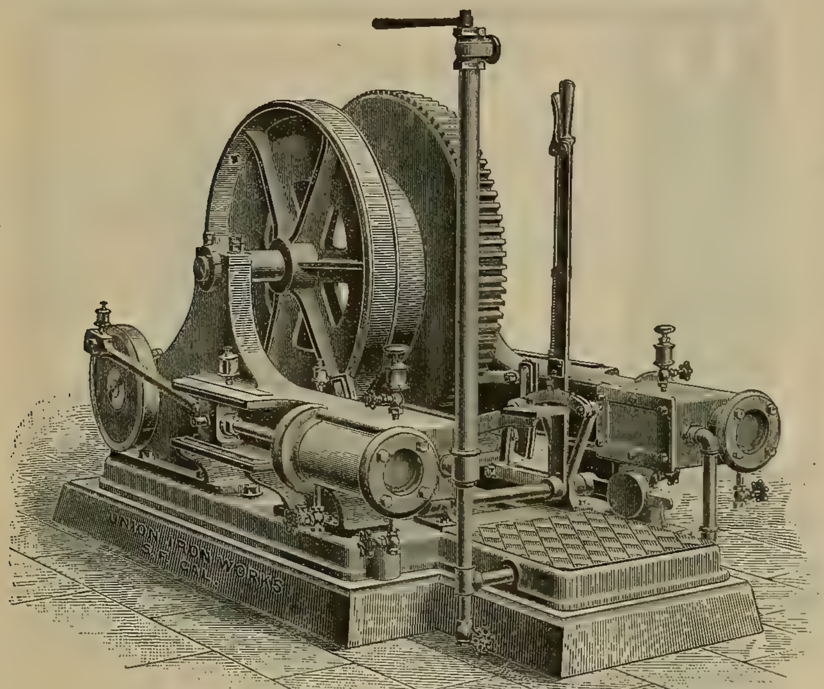
MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

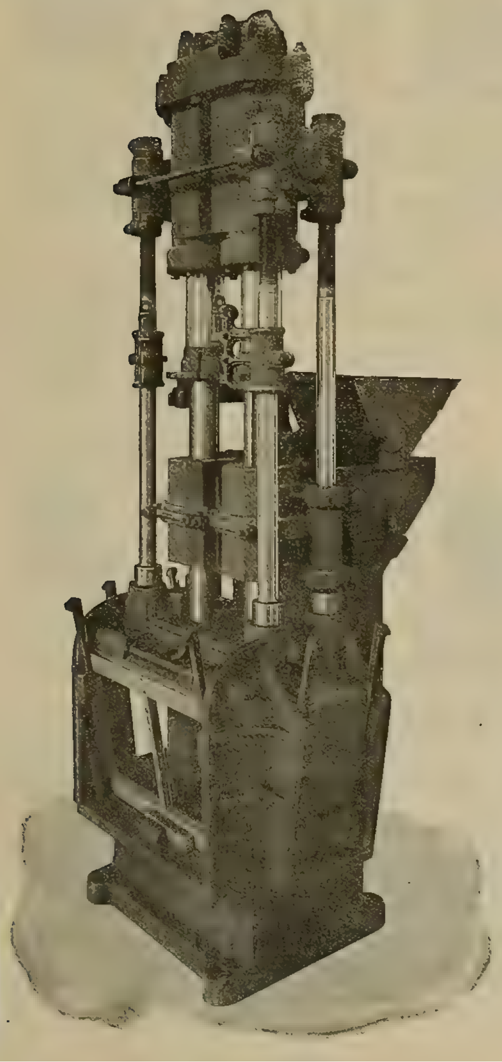
The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

CATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.



A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,
[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,
M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ, AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 8J lbs, whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,
[SIGNED] GEO. HEWER.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

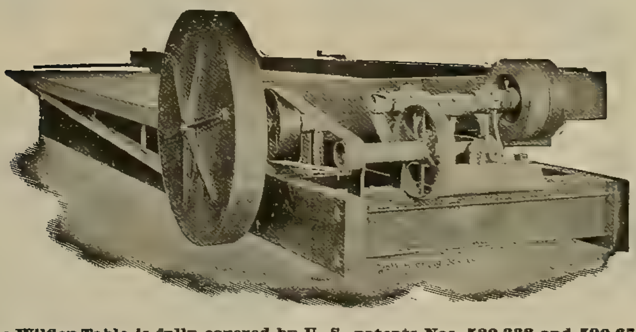
Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.



The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

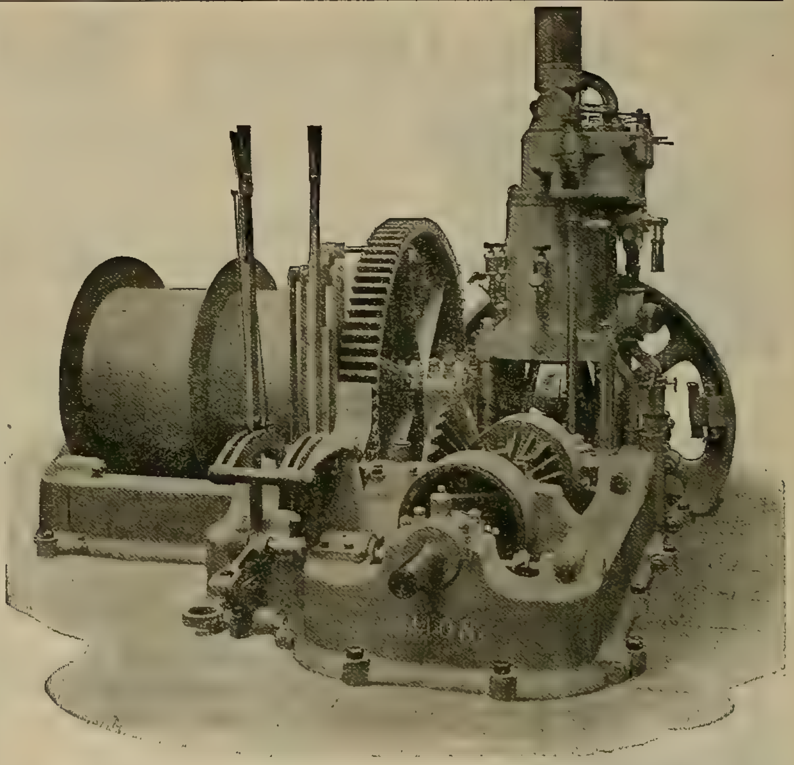
One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.



The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

Are You Confronted With a Difficult Ore-Separating Problem?

THE WETHERILL MAGNETIC SEPARATING PROCESS

may prove the solution. Apply to Wetherill Separating Company, 52 Broadway, N. Y.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of July, 1900, an assessment (No. 17) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of August, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 4th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of July, 1900, an assessment (No. 119) of fifteen cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 14th day of August, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1900, an assessment of seventeen and one-half (17½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of August, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter St., San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of May, 1900, an assessment (No. 25) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of June, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 21st day of July, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 25) has been postponed to MONDAY, the 16th day of July, 1900, and the day of sale from the 21st day of July, 1900, to TUESDAY, the 7th day of August, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 25) has been postponed to MONDAY, the 30th day of July, 1900, and the day of sale from the 7th day of August, 1900, to TUESDAY, the 21st day of August, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1900, an assessment (No. 12) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of July, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 1st day of August, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 12) has been postponed to Thursday, the 26th day of July, 1900, and the day of sale from August 1st, 1900, to MONDAY, August 20th, 1900.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

DEWEY, STRONG & CO.,
PATENT AGENTS, 330 Market St., S. F., Cal.

DELINQUENT SALE NOTICE.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 19th day of April, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
J. P. E. Heintz	156	1,000	$100 00
Wm. A. Junker	71	500	50 00
Annie D. Weeks	133	500	50 00
C. G. Von Treutler	127	400	40 00
Duncan S Hayne	157	1,000	100 00
A. Feist	165	1,250	125 00
George Schoenwald	131	100	10 00
Thos. A. De Lay, Trustee	88	6,000	600 00

And in accordance with law, and an order from the Board of Directors, made on the 19th day of April, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Heald's Business College, 24 Post street, San Francisco, California, on WEDNESDAY, the 25th day of July, 1900, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

DELINQUENT SALE NOTICE.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 25th day of May, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
J. L. Tisdale	34	2	$4 00
J. L. Tisdale	35	2	4 00
H. P. Cartier	67	5	10 00
J. J. Gunn	85	4	8 00
Geo. H. Folsom, Trustee	101	20	40 00
Luther J. Holton, Trustee	107	10	20 00
F. E. Densmore	108	25	50 00

And in accordance with law, and an order from the Board of Directors, made on the 25th day of May, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at No. 310 Pine street, rooms 35 and 36, San Francisco, California, on MONDAY, the 30th day of July, 1900, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. PEW, Secretary.

Office—No. 310 Pine street, rooms 35 and 36, San Francisco, California.

MINING AND SCIENTIFIC PRESS. AND PACIFIC ELECTRICAL REVIEW.

No. 2088.—VOLUME LXXXI. Number 4. SAN FRANCISCO, SATURDAY, JULY 28, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Mining Experts.

In all sciences expert evidence is sought where there is dispute or litigation. In mining cases the costs of expert evidence are frequently one of the largest items in the bill of expenses, sometimes aggregating $250,000 in a single case. The competent expert is a necessary factor in a mining case, where the interests involved or the intricacy of the question makes justice more likely to be secured by the assistance of men who can state or explain facts, and thus aid the lawyers and the judge to properly deduce correct statements and decision.

There is considerable harsh criticism of mining experts, partly because of the conflicting opinions sometimes given, and some of it is deserved. But even judges' decisions are occasionally reversed, and the Supreme Court of the United States has reversed itself. No one is infallible. The chief trouble lies in some judges being at the mercy of unscrupulous "experts" who impose on their ignorance of the facts.

The real mining expert is of value to his client and the court because of his honesty, truth and self-respect, and because he is fully equipped for the case, being qualified to give testimony. The wealthier of two litigants is not always right, nor is the more famous expert. The real expert will state the truth as it appears to him, will not endeavor to confuse nor confound the facts, and will not allow his answers to be influenced by any other consideration than his own independent judgment. In so far as any mining expert giving testimony in a court of judgment deviates from or falls below this standard, so far does he fail in just claim to being a "mining expert." It may be that in time the court will have an expert of its own as a technical adviser in cases where there is a "conflict of evidence." The present tendency is that way, as a matter of necessary evolution.

Kinds of Miners.

Viewed in the degree and kind of information individually possessed there are three kinds of miners: men who have studied in a mining school and nothing more; men who never saw the inside of a mining school but have grown up and been engaged in the actual work of mining for many years; and men who have learned a good deal in a good mining school and have had subsequent practical experience in actual mining work. Each has his place, and, in a way, each one can do good work, but it will probably be agreed with by a majority of miners that the third named—the man who unites the knowledge gained from the experience of others given in books with that from his own experience gathered in actual work—is, probably, of the most benefit to himself and those with whom he is associated. In these sunset months of the century it is in order to discuss this subject, a very important one, on which a great deal has already been well said.

The young mining engineer, "fresh" from school, is credited with knowing a good deal, with ability to obtain the best results with the least expenditure of money, time and labor under given conditions, and is supposed to have knowledge of how work should be done to insure such results. A young man of intelligence and trained in competent schools would doubtless be able to do good work under some conditions. But, of many varieties of him, the man whose knowledge is confined to what he has learned by the hard knocks of experience; the man who has learned about the work by actually doing it, is ofttimes the far more useful member. The man who got his mining education about the same way as a chicken gets its breakfast—a grain here and a grain there—and who has been doing practical mining all his life, has in many ways a superiority, the chief trouble with him being that occasionally he thinks he knows it all, though this phase of self-sufficiency is sometimes observed in the mining school graduate.

Success in this class of work offers many shining prizes. Indeed, the close of this century finds the science of mining offering as much inducement as any other occupation, as it is becoming a matter of large undertakings, where much is involved, and, where, as in nearly everything else, mind rules matter: the manual labor being relegated more and more to machines, and the man in charge expected to be sufficiently up in the theory and practice to make him a man of affairs, capable of successfully handling large schemes. This man will probably be oftenest found among those who are well grounded in mining education and who have had the experience that can only be acquired by actual work; that is, the man who combines practice with what is commonly called theory will be the best man. Knowledge gained in the mining school is developed into its fullest value by practical work, though without such primary education he is likely to lose considerable valuable time. His experience will forbid that he err in attempting that which is only apparently possible; it should forbid that he undertake to put into force rules of text books without the modification which almost every practical piece of work enforces upon them; it will also give him the ability to seize the opportunities often presented in practical work and to make the best of the situation. It is to this combination; to the existence of men who have combined the faculties attained by years of hard labor in the doing of work as well as the knowledge of text books, that much of the great progress in scientific mining is due.

The time is about past when the miner who "does not go much on science" has the floor. Time was when the scientist or the geologist was a sort of good joke, to be gently joshed by the men who were doing the work and who in a kindly superior manner declined to take him seriously. This was the time when a choice kind of a joke in a mining camp was to put up a job on anyone who laid claim to any kind of scientific mining—sometimes with entire success, as some of the book miners were as sadly deficient in practical knowledge as any men over-educated on a subject of which they had no practical information. These were the days when the orthodox miner put all the mining schools under excommunication and almost universally voted that if he did not know it all, he came pretty near it, and that the man from the mining school came just as near not knowing anything about it. That day has passed and intelligent miners everywhere now recognize the value of properly directed scientific mining.

The value of a man who is able in an emergency to discern and remedy faults; who can tell when machinery is doing its full duty; who can effect the greatest saving of values from the ores treated; who can determine the most economical method of work but who can refrain from making such economy too expensive; who understands the effect and use of explosives; who has up-to-date knowledge of rock formations; who understands timbering, ventilation and drainage; who knows how to keep from gouging the eyes out of a mine; who is able to block out sufficient ore to insure continuous operation; and who does not hold himself so far above those with whom he daily associates that he would fail to recognize the "man," no matter in what capacity he may be employed—such a man is not an ideal by any means; there are many of him, but they did not get all their education in a mining school, nor did they content themselves with scoffing at those who have.

There has been a tremendous amount of money and effort misspent in mining. Every miner who reads this can call to mind right in his own locality where a little intelligence, where some knowledge of geology and the science of mining would have made all the difference between the place having a black eye and being a producing camp. Monuments to unwise mine management are within sight of each other all over this west half of America. Idle mills built to operate visionary processes; tunnels running away from the vein instead of toward it; costly shafts sunk just where they should not have been; an ideal plant built to crush and treat the ore before its sufficient existence was proven: all these things go to demonstrate the difference in the man. For, after all, as in nearly everything else, the question comes down to what kind of a man is at the head of the project. If he has knowledge, judgment and skill he can make money develop a profitable payer. If he knows nothing except from books, or if he has a scorn of anything in books his self-sufficiency may waste investors' money and throw himself into the ranks of the unsuccessful.

◆

Some splendid specimens of printing are regularly received in the shape of catalogues sent by enterprising makers of and dealers in all kinds of machinery. Many of them are valuable trade treatises, full of fine description of appliances and devices for economical mine work, and are handsomely illustrated. Some of these are rolled and otherwise poorly mailed, which, to the writer, seems a mistake. It is not economy to spend thousands of dollars in preparing a really valuable work and take away from its value to the maker by "saving" a few cents in its proper transmission. A catalogue should not be rolled. It is meant to reach a prospective customer, and should get into his hands in such a shape as to have lost none of its attractiveness. It is good business to put out a good catalogue, but it is poor economy to roll it tight and put on a flimsy wrapper in sending it out. Next to a good advertisement, in the paper seen by the men most likely to be buyers of what is advertised, a good catalogue is a trade getter, but it should be put out in good shape.

Commendable Work.

The receipt of a monograph, "Geology of the Little Belt Mountains, Montana," an extract from the twentieth annual report of the U. S. Geological Survey, is a good example of the fine work that branch of the public service is doing. The U. S. Geological Survey is of great and constant aid to the mining industry, and of late years is paying back in some degree the debt that geologists owe to the miner, for to mining more than to anything else is geology indebted for its present advanced position. Thus the matter is one of reciprocity, and in this regard is to be noted and commended the policy of Director Walcott in his zealous and successful effort to give timely and accurate knowledge of requisite facts. Recognizing the requirements of practical, up-to-date information, has been adopted the policy of making almost immediate reports of great value to miners concerning newly discovered districts. To the Montana monograph is appended a list of sixty-two geologic folios now ready for public distribution, to be furnished to any applicant on payment of a small fee. When all these folios are furnished they will constitute a geologic atlas of the whole nation.

This work goes steadily on year by year, and the sums appropriated are wisely expended. Not the least of the good resultant or made possible is the kindly co-operation of the Federal survey with the several State surveys, and continued co-operation wherever practicable. The U. S. Geological Survey, as at present conducted, recognizes that were it not for the mining industry there would be little practical need for its existence, and the broad policy of its officers and attaches is commensurate with the area and industry they attempt to cover.

In this regard it is to be regretted that the several States are so backward in taking advantage of their possibilities in State geologic survey work. The U. S. Geological Survey is empowered to undertake topographic mapping in any State where it is asked for by the State, the expense to be divided equally between the State and Federal government. The functions of the U. S. Geological Survey and those of any State geological survey are different, and are so recognized, but, while each has its sphere of action, co-operation can be secured entailing increased benefit to the very ones all this is intended to benefit—the miner and, indirectly, the mining industry.

◆

The origin of ore deposits is an interesting and practical subject of discussion, and one that has had considerable of value contributed by men who have given the vast subject careful study. The subject is one of scientific inquiry and of immediate practical value to metal miners everywhere. It is, of course, easy to say: "We don't care how the ore originated. The question for us is where is it and how can it be best reached and most economically treated?" Yet a satisfactory solution of the more abstract scientific inquiry will aid in answering the concrete practical requirements of the miner. This last fact gives great importance to the contributions of geologists and scientists during the past twenty years, the result being that the matter is emerging from the shadowy domain of theory and hypothesis, and is assuming the nature of an exact problem which admits of definite and satisfactory solution. In the last few months have been received several excellent monographs on the subject of the genesis of ore deposits, and another is promised. The requirements are recognized as embracing a scheme acceptable to geologists and of practical aid to the miner, and it is along these lines that present advance is being made.

Concentrates.

Revenue stamps are not required on location certificates.

The Almaden, Spain, quicksilver mines annually produce about 50,000 flasks of 76½ pounds each.

The Selby Smelting & Lead Works, San Francisco, Cal., buy gold-zinc slimes on their assay value.

There is little market for California chrome ore, and none for any carrying less than 40% chromic acid.

As a water column 1 foot high exerts a pressure of .43 pounds per sq. in., a pressure of 3.97 pounds per sq. in. represents a head of 9.2 feet.

With exceptional transportation advantages a 10% lead ore if free from zinc might be mined at a profit, but not in southwestern Nevada.

The highest point reached by any railway in the world is at the Galera tunnel—15,678 feet—on the line from Lima to Oroya, Peru, South America.

Melville Attwood, who died April 25, 1898, is credited in California with having invented and introduced the blanket system of amalgamation.

Chemically pure tin can be had from Jno. Taylor & Co., San Francisco, Cal.; F. W. Braun & Co., Los Angeles, Cal., or the Roessler & Hasslacher Co., New York City.

Work on the four restraining barriers in the Yuba, Cal., river, for which $500,000 is appropriated and available, will begin when the necessary land is under Federal control.

A Honduras, C. A., subscriber writes, ordering an extra copy of this paper, "that I may cut out the advertisements in answering them and yet preserve one copy intact for binding."

Long-continued experiments in the Bodie, Cal., cyanide works of the Standard Con. Co. tend to totally disprove the idea that wooden leaching vats absorb gold to any appreciable extent.

Manganese steel is of undoubted value, having a combination of hardness and toughness that commends it where grind or wear is severe. For marine or dredge work manufacturers consider it particularly well adapted.

Criticism is constantly invited and correction of any inaccuracy or mistake thankfully received. The idea is to be exact and as near correct in statements as possible, for information is of value in direct proportion to its accuracy.

Where practicable, crude petroleum oil is found preferable to oil for fuel in both roasting and smelting furnaces, it being essential to maintain in each case an oxidizing atmosphere, which can be steadily maintained by oil or gas fuel, but not by coal.

It being presumed that every locator of a mining claim in this country is a U. S. citizen, it is unnecessary to mention the matter of citizenship in a location notice. If the locator be an alien, the initiative in dispossessing him must be taken by the Federal Government.

An engine of 180 H. P., burning three and one-half tons of coal in ten hours, ought to be able, with proper accompanying appliance, to dredge and elevate about 350 cu. yds. of solid material per hour, 40 feet high, or 1000 cu. yds. per ton of coal, reckoning on 50% efficiency.

Hydrogen and oxygen can be produced from water by an electric current, but a cheaper and easier way to produce hydrogen is by the action of hydrochloric or sulphuric acid on zinc; and to "make" oxygen, by heating manganese dioxide and potassium chlorate in a retort.

There is no fixed date for the annual convention of the California State Miners' Association. It is usually held in San Francisco in October or November. There is to be an election this year, and it has been suggested that the convention be held before that event takes place.

Were all the gold mines in the world productive, solely, of free-milling ore, there would, doubtless, be great scope for bromine processes, but the usual presence of other metals for which bromine has a great affinity precludes extensive belief in the universal value of its operation.

A bullet fired at 45° elevation is supposed to travel through the most space—that is, of three of the same weight, fired with the same force and under similar circumstances, one horizontally or any angle but 45°, one perpendicularly and one at 45°, the latter would have the longest trajectory.

Green wood when cut down contains about 45% of its weight in moisture; kept for several years in a dry place it will retain 15%; if thoroughly dried, it will, if exposed to air under ordinary circumstances, absorb 5% of its weight in water the first three days and continue absorption till it reaches about 15%.

Doubtless there will be further development in stamp batteries, probably in the direction of increased adaptation to dry crushing, and the introduction of variable adjustment as will enable any number of stamps in the same battery to crush any kind of ore, the latter presenting the most difficult problem.

There is no law nor statutory provision in California or in any other State against hydraulic mining. In California a decree of a court and injunctions under that decree have interfered with hydraulic mining operations, but Congress some years ago passed a law under which hydraulic mining may be carried on. That law, known as the Caminetti Act, has been declared to be constitutional, in a case where its constitutionality was attacked by a California hydraulic mining company at North Bloomfield, Cal.

Permanganate of potash is an antidote for the bite of a rattlesnake or other venomous reptile. To use it the wound should first be enlarged and then saturated with the drug, after having first tied a shoestring, suspender or some handy ligature around the limb, as the leg or arm is usually the point attacked.

The term "lode" is more general and all-embracing than "vein." There may be several "veins" in a "lode." The latter term includes everything between the hanging and the foot wall, and if beyond those there be an impregnation of country rock of equal value to that in the fissure, that, also, would be considered as part of the "lode."

There are abundance of quartz and placer gold mining properties in the island of Borneo, but no one should think of going there unless with abundant capital, credentials and intimate acquaintance with all the conditions and requirements. Chinese and Dyaks work these mines, and, if clever, can earn as much as 7 pence per day, English money.

If exhaust steam be used direct for heating water passed over amalgamator plates, it is liable to contain sufficient oil in solution to form a coating on the surface of the quicksilver and thus prevent complete amalgamation. Where exhaust steam is thus utilized, none of it or of the condensed water should be allowed to come in contact with the plates.

The swindler and bogus mine promoter prefers the newest mining fields as affording less likelihood of immediate discovery of fraud, it being sometimes difficult to get reliable information about a property in a new district. Some of the prospectuses are wonderful illustrations of the possibilities of language when used by men in ignorance or defiance of the facts.

In measuring a miner's inch of water, the surface of the water is to be exactly 6 inches above the center of the discharge. If the aperture be 2 inches in height, each sq. in. of the opening in the plank (1½ inches thick) will discharge a "miner's inch" = .02499 cu. ft. per second, 1.4994 cu. ft. per minute, 89.964 cu. ft. per hour, 2159.146 cu. ft. per day of twenty-four hours.

The Union Iron Works of San Francisco, Cal., has a device intended to increase the capacity of the stamp mill, being the placing of a small fine crusher between the ore feeder and the mortar. The feeder is located above the battery floor, is operated from the stamp, and automatically feeds the ore into the crusher, which, in turn, delivers it in ¼-inch cubes to the stamp.

That a steam boiler explodes because of gases generated in the boiler is only an unproven hypothesis. A boiler explosion is because some part of it is too weak for the pressure. The weakness may be due to poor workmanship, design, material or defect. Nor is there any "accident" about such explosion. It is the result of the action of exact law, and is no more "accidental" than the phases of the moon.

In the case of Hartman vs. Smith, 7 Montana, 19, the court held that "all that is necessary to make the claim of a mill site by the owner of a non-contiguous mining claim valid is the reasonable use and occupation thereof for mining purposes in connection with a mining claim." A mill site may be patented by compliance with the same requirements regarding survey and notice as are applicable to veins or lodes.

The Copper King property is 27 miles from Fresno, Cal. Four reports were made by mining engineers upon it in 1898. The last of the four was made by F. O. Harvey, Dec. 2, 1898, who estimated that there were "60,000 tons ore in sight of 9½% copper ore, wet assay 4 dwts. gold, 4 ounces silver; ore at surface, 7000 tons 9¼% copper, 4 dwts. gold, 3½ ounces silver; 3600 tons 3½% copper, 3 dwts. gold, 3 ounces silver."

The Mauser rifle is not considered equal to the Krag-Jorgensen. The main difference between the two is that while both are bolt guns, the Krag has a magazine which, filled with five cartridges, can be cut off so as to make the rifle practically a single shooter; the Mauser's magazine can not be so cut off. Then, in the Krag, the bolt is opened and closed by the action of cams; in the Mauser the user has to compress the main spring by direct force.

In Tarapaca and Atacama, Chile, S. A., nitrate of soda is found in horizontal or slightly inclined beds or strata 6 feet from the surface, mixed with sand and pebbles. This substance, locally called "caliche," is blasted out and hauled to a maquina, where it is lixiviated and rudely refined, the tailings, or ripios, often containing from 5% to 15% nitrate of soda. The deposit is from 1 to 2 feet in thickness and is indurated something like the cement gravel of the California drift mines.

The temperature of steam in contact with water depends upon the pressure under which it is generated. At the ordinary atmospheric pressure (14.7 lbs. per sq. in.) its temperature is 212° F. As the pressure is increased, as by the steam being generated in a closed vessel, its temperature and that of the water in its presence increases. Saturated steam is steam of the temperature due to its pressure—not superheated. Superheated steam is steam heated to a temperature above that due to its pressure. Dry steam is steam which contains no moisture. It may be either saturated or superheated. Wet steam is steam containing intermingled moisture, mist or spray. It has the same temperature as dry saturated steam of the same pressure.

South African Rand mine managers figure that they can resume their former output within six months after cessation of hostilities. There are a good many things in the way. Were peace proclaimed to-morrow, the force of native workers is so scattered and demoralized that the question depends as much upon the possibilities of obtaining native manual labor as upon replacing the machinery of the mines. They also figure that there may be an opportunity to reduce the salaries of the natives and thus render practicable the working of mines which produce in small quality.

Under Colorado State law a company when incorporating must pay to the Secretary of State $10 for the first $50,000 of capitalization, or fraction thereof, and 15 cents for each additional $1000 capital stock. A $2,000,000 capitalization would have to pay the Secretary of State $302.50. The present war tax requires 5 cents on each $100 face value of each original issue of certificates of stock in any company or corporation. On the capital stock named this would mean $1000 more, federal revenue tax. The county clerk would charge about $2.50 for filing the articles of incorporation.

The profession of mining engineer is a good one for a competent young man to embrace, and, properly equipped mentally and physically, he should be of value to himself and others therein. A certain amount of bodily strength and activity is necessary. No business makes greater demands on the constitution, and without a vigorous physique the utmost meed of success could not be attained. The editorial on the opposite page contains additional suggestions on this topic. There are many excellent mining schools in this country in which a thorough training for actual work can be had at comparatively small cost.

There are several processes of electrolytic extraction of zinc from its ores, all resembling each other to some extent, the ore being crushed, roasted and leached with suitable solutions of acid or salt, by means of which the zinc is dissolved out. A current of electricity is then passed through the solution, when the zinc is deposited at the cathode, and the exhausted effluent is returned to the leaching vats to be renewed by passing through a fresh charge of the prepared ore. In the Siemens & Halske process zinc sulphide is employed to liberate the zinc; in the Dieffenbach process zinc is produced by electrolysis of a zinc chloride solution.

The old laws on the flow of water have been entirely discarded and the literature on that subject as applied to mining has been entirely rewritten. Books and articles in technical papers of a few years ago are back numbers, and are as out of present use as the almanacs of the years in which they were written. The same remark applies in a modified degree to pumping machinery and the application of electricity to mining. The science of mining is progressive, and the rate has been a rapid one in the past ten years. The best way to keep up is to weekly get some technical mining paper in touch with the times and with the mining men now on earth.

To prepare a blasting charge, cut a piece of safety fuse to the right length and carefully insert the fresh-cut end in a blasting cap. See that the cap is free from any particle of sawdust before inserting the fuse. Press the fuse gently into the cap as far as it will go. Crimp the open end of the cap tightly around the fuse with a pair of cap nippers, but under no condition disturb the fulminate or filling in the cap. Then open one end of the cartridge carefully, and with a sharpened lead pencil or pointed wooden stick make a hole in the powder, insert the cap end of the fuse, being careful to see that at least ½ inch of the cap remains out of the powder. Then draw the paper closely about the fuse and tie it with a strong cord. Another way to prepare or charge a hole is mostly used in dry mines, uppers, etc. For instance, if three sticks of powder are used for a blast, place two and one-half sticks in a hole, then put in fuse with cap on end, let down to powder, keep fuse on side of hole, then slit the paper on powder three or four times lengthwise and drop in hole, ram or tamp carefully at start, then tamp as usual. Never allow smoking or fire of any description near the powder nor leave any loose caps or fuse in the vicinity of the powder.

The pressure of the atmosphere is about 14.7 lbs. per sq. in.; with a perfect vacuum it would sustain a column 33.9 feet high. The height that a pump will lift water depends on atmospheric pressure, which decreases as altitude increases: about ½ lb. per sq. in. for every 1000 feet ascent. Thus the altitude being 4500 feet the pressure of the atmosphere is 2¼ lbs. less than at sea level, or, approximately, 12½ lbs. per sq. in. The moisture in the air makes a difference in the pressure. The readings of a barometer indicate both of these. A barometer reading 28 inches would indicate a pressure per sq. in. of 13.74; 28¼, 13.86; 28½, 13.98; 28¾, 14.11; 29, 14.23; 29¼, 14.35; 29½, 14.47; 29¾, 14.60; 30, 14.72; 30¼, 14.84; 30½, 14.96; 30¾, 15.09; 31, 15.21. One pound per sq. in. corresponds to a head of 2.30947 feet of water; so, to find the lift of a pump, multiply the pressure per sq. in. by 2.30947. If the barometer stands at 28, the corresponding pressure = 13.74 lbs. per sq. in.: 13.74 × 2.30947 = 31.73 feet = "lift" of water. Of course, the pump would not lift this height, as it can not produce a perfect vacuum, and even if it could, there must be enough difference between the pressure in the pump chamber and the atmosphere, not only to sustain the height of the column, but to overcome its friction.

Silver Smelting in Mexico

NUMBER I.

Before the London Institution of Mining and Metallurgy was recently read a paper by Otto H. Hahn, "On the Development of Silver Smelting in Mexico," which, among other things, goes into minute detail and criticism of the method in operation at the time the article was prepared, at Smelter No. 3 of M. Guggenheim's Sons at Monterey, Mexico.

Much of it is of general interest, and a free condensation of the paper so far as it applies to that particular smelter is herewith published. After some preliminary history and description of the power plant, Mr. Hahn passes to the sampling department. He says (much condensed):

The sample mill is a most important part of a custom smelter, for, on the assay results of the samples taken from the ores, the settlements are made. A mistake in sampling may entail serious monetary losses upon the smelter by basing the purchase of an ore on false values and the slag calculations on wrong analysis of the earthy ingredients. It is therefore conventional between smelter and ore vendor for the latter to have a representative on the ground to watch all the operations an ore has to go through from the time of its arrival at the weigh bridge till the final sample is turned out. Since all ore is received in railway cars, the smelter is advised of its shipment by having bill of lading mailed to him; and, being in most instances conversant with its character, the official in charge of the sample mill will know how to dispose of it according to instructions he has received from his superiors. After the ore is weighed, the first thing to do is to take moisture samples. The man entrusted with this work has a number of pans ready with tags in them, specifying mark of ore, number of car and day of arrival. He is also provided with a trowel to dig up the ore and a hammer to break up lumps, for it is necessary to get a fair proportion of both fine and coarse ore. The moisture samples are immediately taken to the office at the sample mill, where an even number of grams—say 500—is weighed up on a small platform scale made for this purpose. The samples are then put on the drier—a coil of iron pipe of sufficient length—through which steam is allowed to circulate. The next day these samples are reweighed, and the result is recorded in the moisture book. Ores are divided into parcels or lots of a certain number of tons, according to agreement between purchaser and vendor. Low-grade ores of a uniform character are usually divided into 100-ton lots or more. When a lot is closed, the net weight of each carload is multiplied by the moisture factor, and then the average moisture of the whole lot is computed.

Since a considerable proportion of the ores received arrives in sacks, these are cut open in the car and emptied right there; or, if the ore is rich, they are taken to the sample mill, reweighed on a movable platform scale and emptied on the floor. The moisture sample is then taken as usual. It is a matter of course that the sacks have to be turned inside out and shaken to free them from ore dust before they are weighed and returned to their owners.

The iron ores and other ores of little silver value are unloaded in the open air, while lead ores and high-grade silver ores are put into the covered ore shed between the sample mill and the blast-furnace shed. The roasting ores are unloaded into bins near the calciners, if they are fine, or on a platform adjoining the sample mill if they need crushing.

Ores of the same class are "bedded," that is, spread out in horizontal layers of the same thickness, one above the other. If another lot follows, the previous one has to be leveled off before putting the new one on the bed. The size of the beds is limited by the space available, the height and the time when they are wanted. So of iron ores, beds of 2000 tons are made up, of lead ores from 800 to 1000 tons, and of silver ores less. Of course, these beds are numbered, and a strict record must be kept of the lots composing them and of their weights. If the samples of any of these lots are put on another bed, their weights must be deducted from the weights of the lot. The numbers of the beds must be set up on top of them and marked on material indestructible by the weather. Big lumps are broken with a hammer and the fragments are distribted evenly over the surface of the bed.

During the unloading process samples are taken by throwing the twentieth, tenth, fifth or third shovel—according to richness of ore—into a wheelbarrow, which, when full, is wheeled to a platform adjoining the sample mill and piled up there. The sample is marked by sticking a peg, with a card attached to it containing the description of the ore, into the top of the pile. Samples of concentrates of rich ores are preserved in numbered bins erected opposite the sample mill, and their tags are nailed on the doorposts of the bins. Samples from wheelbarrows which have been upset must not go to the sample pile, but must be rejected. After a car is unloaded its floor must be kept clean, and also the track, and the sweepings are thrown on the bed.

If a lot of ore is closed which is marked on the bill of lading or ordered by the consignor, the sample is made by spreading it out in a flat, circular pile, breaking up the lumps with a hammer and quartering it down to convenient size. If the ore is hard and tough, the whole sample must be passed through a crusher previous to quartering it down. The reduced sample is then taken to a pair of rolls in the sample mill, and, after crushing it to pea size, quartered down again to about five pounds. This further reduced sample is dried at a temperature of 212° F. on the dryer and then put through the sample grinder. The material from the sample grinder is passed through a 120-mesh brass wire screen, and the remainder is ground by hand on a bucking-board till it is fine enough to pass also through the same sieve. The powder or "pulp" so obtained is now thoroughly mixed on a piece of oilcloth, and from it four bags of stout Manila paper, 6½x3½ inches, holding about eight ounces, are filled. In the United States glass bottles are preferred, and they are certainly much better suited to guard against contamination of the sample, but, as they can not be transmitted through the Mexican mails, and express offices are not plentiful in Mexico, and, finally, because glass is dear, paper bags have become the rule. Three samples are sent to the assay office of the works, and one is given to the representative of the ore vendor. Of the samples sent to the assay office one is destined for the use of the assayer, one for the chemist and the third one for the umpire. The latter and the ore vendor's samples are sealed. After use, the samples pertaining to the works are preserved until the ore has been settled for and gone through the furnaces. Umpire samples are kept longer, unless required to settle differences between purchaser and vendor, in which case the assayer elected by both as umpire receives them.

But it is not the ores alone which the sampler has to look after; there are other materials and secondary products which require sampling—coal, coke, limestone, iron ore, matte, speiss and barrings (furnace accretions)—and bullion purchased from small smelters.

Coal is only sampled when a new kind is received, or when a deterioration in quality is suspected or confirmed; it is analyzed for carbon, ash and volatile matter.

Coke is sampled regularly, moisture samples and laboratory samples being taken from every car arriving at the works. When the last of a shipload has come in, the coke sample is cut down like that of an ore and analyzed for volatile matter, fixed carbon and ash. Sulphur is usually not determined, as the small quantities present in coke do not affect either the smelting process or the product. The volatile matter, however, is supposed to have an important bearing upon the reducing power of coke. Some metallurgists condemn a coke containing over 2% of gaseous matter.

Limestone is sampled and analyzed only once in a great while, or, if a new kind is received which should be unloaded by itself.

Iron ore, pure and simple, was used only in blowing in to the extent of less than a ton. Its contents in iron and silica are known.

Matte is weighed and sampled every month while being run through the mill preparatory to the roasting operation, and again after coming out of the roasters. The matte is designated by the name of the month in which it is produced.

Speiss is weighed for the purpose of the monthly cut-off or inventory taking, but sampled and assayed only when produced in quantity. Its contents do not vary much in one and the same place.

Barrings, after picking out coke, large lumps of limestone and firebrick, are weighed, sampled and thrown on a lead ore bed. The sample is analyzed and assayed the same as an ore.

The sample mill occupies a space of 89 feet in width by 149 feet in length between two sets of tracks, but is hardly large enough for the constantly growing business. It is a double building, covered with an M roof, and has a double wooden floor inside, with steel plate around the crushers and rolls. The tracks along the sides of the building are also planked between the rails, so as to be able to recover any spilled ore.

A narrow part of the gable end facing toward the weigh bridge is partitioned off into five compartments, the first of which contains the motive power; a second the drying oven; a third the bucking room with the sample grinder; a fourth the office of the foreman in charge; and the fifth an area or hall between the latter two. This area is used by the representatives of the ore vendors to look at the final proceedings with their samples, through a window in the partition. Admittance to the bucking room is denied them and all unauthorized persons, to preclude the possibility of tampering with the samples. In the sample mill building there are two 7x10-inch crushers set at convenient distances; and in front of each, facing toward the ore shed, one pair of rolls, 10x16 inches, and another pair 10x20 inches. At the gable end, facing the roasters, there is a set of machinery constituting the "sulphide mill." It consists of a 7x10-inch crusher, a pair of rolls, 14x30 inches, and two cup elevators, one of which lifts the coarse material from the crusher into the hopper of the rolls and the other lifts the fine stuff from under the rolls into a storage bin.

This machinery makes so much dust that it is but seldom used, and then only for ore and tough material. It has no business in a sample mill, but should be in a place entirely by itself.

For matte crushing a ball mill is used, erected next to the sulphide mill on the outside of the building. A machine with 120 steel balls pulverizes from 80 to 100 tons of weathered matte in ten hours fine enough to roast well. With the toughness of the material the efficiency of the mill decreases; of copper matte, with 30% copper, only one ton per hour would go through. Speiss can not be pulverized in it at all; it is simply converted into ellipsoidal balls which revolve like steel balls, and are merely polished, not crushed.

(TO BE CONTINUED.)

An Old Bell.

In the office of C. T. Brown, of the Buckeye M. Co., with office at Socorro, is found what is alleged to be the oldest bell in the United States. This historic bell was made in 1549. In 1680 the church was destroyed by the Indians. In 1734 the bell was dug out of the ruins of an old church at Gran Quivera, an old pueblo and Spanish city, said by several Spanish historians to have exceeded 20,000 in population. From Gran Quivera the bell was brought back to Socorro and hung in the old San Miguel church.

In 1781 this church at Socorro was destroyed by Indians and the people driven south to Isleta, near El Paso. In 1806 a colony of seventy families came from Belen, on the Rio Grande, and resettled Socorro and repaired the old church, which stands to this day. This old bell was again resurrected and placed in the church. The bell weighs 461 pounds. The metal used in it came from a mine in Grant county, called the Santa Rita de Copie. The women added all their jewelry of silver and gold to it. Chippings from the old bell have been assayed and it is found that it is worth over $400 in gold and silver.

This bell was the first to ring on the American continent, and that on the banks of the Rio Grande. Seventy years before the Mayflower sailed into Boston harbor this old bell, with its clear tone, was calling together a brave little band of worshipers with their weapons of defense in one hand and the cross in the other.—New Mexican.

Structural Steel Consolidation.

The organization of the American Bridge Co., with offices in New York City, effects the consolidation of the following concerns who do structural steel work: Berlin Iron & Bridge Co., East Berlin, Conn.; Buffalo Bridge & Iron Works, Buffalo, N. Y.; Detroit Bridge & Iron Co., Detroit, Mich.; Edgemoore Bridge Works, Wilmington, Del.; Elmira Bridge Co., Elmira, N. Y.; Gillette–Herzog Mfg. Co., Minneapolis, Minn.; Groton Bridge Mfg. Co., Groton, N. Y.; Hilton Bridge Construction Co., Albany, N. Y.; Horseheads Bridge Co., Horseheads, N. Y.; Koken Iron Works, St. Louis, Mo.; Keystone Bridge Co., Pittsburg, Pa.; La Fayette Bridge Co., La Fayette, Ind.; Lassig Bridge Works, Chicago, Ill.; American Bridge Works, Chicago, Ill.; New Jersey Steel & Iron Co., Trenton, N. J.; New Columbus Bridge Co., Columbus, O.; Post & McCord, Brooklyn, N. Y.; Pittsburg Bridge Co., Pittsburg, Pa.; A. & P. Roberts, Pencoyd, Pa.; Rochester Bridge & Iron Works, Rochester, N. Y.; Shiffter Bridge & Iron Works, Pittsburg, Pa.; Union Bridge Co., Athens, Pa.; Wrought Iron Bridge Co., Canton, O.; Youngstown Bridge Co., Youngstown, O.; Milwaukee Bridge Co., Milwaukee, Wis. Percival Roberts Jr. is president; Chas. McDonald, vice-president; with Frank Conger, Wm. H. McCord, Chas. M. Jarvis, C. C. Snyder, James Christie, Wm. H. Connell, Chas. C. Price and F. W. Heisler at the head of various departments.

Triplex Electric Sinking Pump.

The new triplex electric sinking pump, illustrated on page 89, produced by the Jeanesville Iron Works Co., Jeanesville, Pa., is claimed by its manufacturers to be satisfactorily susceptible of operation by an electric current direct from a water power situated miles from the point of application; that it produces no heating effect in the shaft, the steam pipe being entirely eliminated, and when the pump is stopped there is no waste of current, and when in use current is consumed in the exact proportion to the work performed.

The design contemplates three single-acting plungers operating from common crank shaft with crank pins placed 120° apart, the resultant action of these three plungers being to produce a continuous and constant stream to the column pipe and tend to reduce to a minimum the shock and jar thereon.

The steel crank shaft is driven by two gears fitted over the discs which form the outside cheeks of the two end cranks, thus designed to relieve the shaft of one-half the strain that would be brought upon it if driven by a single gear at one end.

The motor is on top of the pump frame and connects the crank shaft by gearing to give the desired speed to pump. The pump frame is made to receive any make of motor which is adapted to this kind of work, either direct or three-phase current.

The Cripple Creek Volcano.*

NUMBER III.—CONCLUDED.

Eventually (it may have been several thousand years after the first manifestation of activity) the volcanic energies became wearied, and lava ceased to appear at the surface. The readjustment of the earth's crust, at this particular locality, had been accomplished, and a condition of equilibrium supervened. The lava sank beneath the level of the crater, and. on cooling, plugged up the conduit. Those who are engaged in mining at Cripple Creek are aware of the existence of numerous large cavities underground, particularly in the southern part of Bull bill and the northwestern portion of Battle mountain. In the Logan mine the orifice of a very large cavity was recently encountered while sinking the shaft. The sudden flows of water which have embarrassed some of the mines are due to the unexpected drainage of such openings. It is worthy of note that these especially characterize the trachyte-phonolite and those rock masses which represent the lavas extruded last.

After the volcanic energies had declined, there followed a long period of smothered activity, evidenced by geysers and hot springs. Steam continued to escape, but gently. There was none of the violence of the earlier period. Heated water accompanied the steam, instead of fused rock. The hot lava still existing at greater depth served to give expansive force to the surface waters which found their way, by seepage, through the overlying deposits of volcanic material. The steam and hot water now emitted, at some spots quietly as a thermal spring and elsewhere intermittently as a geyser, probably carried a good deal of mineral matter in solution. A wonderful work is accomplished in this quiet way, because such activities extend over enormous periods of time. Prof. Judd has shown that the hot spring at Bath, England, although an apparently unimportant geological agent, brings daily to the surface 180,000 gallons of water at a constant temperature of 120° F. This spring was doing its duty at the time of the Roman invasion of England, and it is estimated that since that time it has brought up, in solution, enough material to form a good sized volcanic cone.

The Cripple Creek district exhibits abundant evidence of hydrothermal action. This is particularly the case in the northwestern part of the mining area. The breccia of the upper parts of Globe and Ironclad hills, penetrated by the workings of the Deerhorn, Summit, South Park, Plymouth Rock and other mines, is much decomposed, and has a loose, crumbly character. It is seamed to an unusual degree with irregular fractures, lined with secondary minerals, among which crystalline gypsum and amorphous kaolin are the most common. In the Deerhorn shaft there is evidence of a more definite kind. At a depth of 240 feet the shaft cuts into a mass of gypsum, and from that point to the bottom, 575 feet below the surface, it has been sunk in the midst of what appears to be a series of extinct thermal springs.

The workings are very extensive and connect with the adjoining mines. Breccia and tuff compose the prevailing rock. No distinct dikes are visible near the Deerhorn shaft; it is probable, judging from the composition of the breccia at several points, that several intrusions do exist, but that they have been so shattered in place as to be scarcely distinguishable from the original breccia which surrounds them. At the third level, and at the succeeding levels, there are three distinct narrow-pointed cones of compact white gypsum which, at 15 to 25 feet from their apex, graduate into chimney-like masses of breccia cemented by crystalline gypsum. At the sixth level there is a fourth of these occurrences. Others, which do not happen to have been intercepted by the workings of the mine, may exist in the vicinity.

Iron pyrites is found in the gypsum; it occurs as a scattering of coarse crystals in the upper portion, and finely disseminated lower down. The white gypsum carries patches which are stained pink by fluorite. The surrounding breccia is everywhere traversed by color bands due to layers of gypsum, manganese oxides, and iron ocher. Scattered through the vicinity, but parallel to the group of columns above described, there are patches, as well as seams, of fluorite sand, consisting of particles of crystalline silica stained purple by admixture with fluorspar. The upper levels also show bands of a white unctuous clay, named "Chinese talc" by the miners. This is pure kaolin, derived from the decomposition of the feldspar in the andesite fragments composing the bulk of the breccia. The latter is in a crumbly condition, its character being suggested by the fact that in driving the levels only a pick is needed, the ground requiring no blasting. Beyond the central portion, which has structural lines sympathetic to the arrangement of the columns of gypsum, the breccia is still stained and disintegrated for a great distance, and in places exhibits suggestions of the neighborhood of other thermal conduits.

There can be no doubt as to the nature of these masses of gypsum. Thermal springs which have become extinguished are marked by just such accumulations of lime, although the carbonate is, under such circumstances, more common than the sulphate. The flows of hot water encountered in the deep workings of the Comstock carried a notable percentage of gypsum. Last April, while examining certain copper mines near Hawthorne, in Nevada, the writer came across a group of similar vents, marking the site of former thermal springs. The conduits, in this case, occurred in lime shales, and were still open to a considerable depth, as was proved by dropping stones into them. They were surrounded by a compact chimney of carbonate of lime, which had also overspread the enclosing rock.

Recurring to the conditions observed in the Deerhorn shaft, it would seem that the rising hot waters, in their approach to the surface, were unable to maintain a defined channel through the breccia higher than the level marked by the tops of the cones of gypsum. This might be caused, first, by the fact that the vapors ascending above the subterranean springs disintegrated the breccia so as to destroy its cohesion, and changed it from a compact rock to loose material. The most potent factor, however, was probably the diffusion of the ascending waters into the drainage of the surface, the effect of which would be encountered at this horizon. The condition of the breccia and the wide area which has undergone disintegration favor this view.

It is in accord with facts observed in other regions that the vents which permitted the emission of lava flows should be in one part of the volcanic area (in this case the southern portion) while the escape of hot waters which marked the time when the volcanic energies were waning should have occurred in another part, in this case the northern and northeastern. The lava had healed lines of weakness; it had cemented the fractures produced by the earlier paroxysmal efforts of the volcano; and therefore the thermal waters found a better chance of exit elsewhere. With the hot waters which found their way to the surface during the closing period of the volcanic cycle there were emanations of gas. Sulphuretted hydrogen was probably emitted, sulphurous acid gas, and, in all likelihood, carbonic acid gas, at one place or at one time. The volcano had now reached the "solfatara" stage. These acid gases played an important part in altering the volcanic rocks, and were, possibly, a factor in the process of ore deposition which was beginning. The vapor of hydrofluoric acid was also among the agencies at work. This is inferred from the large amount of fluorite, the fluoride of calcium, which occurs all over the district, and more especially in the gold-bearing lodes. Fluorite is not found in the lava of Vesuvius. The action of hydrofluoric acid on feldspars containing lime would form fluorite. It would also convert gypsum in a similar way. Fouque has shown that the action of hydrofluoric acid in the liquid state is to decompose, first, uncrystalline silicates or glasses, then fieldspar and other acid silicates, then quartz, and lastly, basic silicates. Whether the vapor of hydrofluoric acid would act in the same way is uncertain, although it is possible that in this case quartz might be attacked in preference to the feldspar. This is a matter of interest, because in examining specimens of granite which have been converted into ore (by the addition of gold-bearing tellurides) it is observable that the original quartz of the granite has been attacked while the orthoclase remains comparatively fresh.

This last stage of the Cripple Creek volcano is of great importance to the mining geology of the region. It extended over an enormous period, coinciding, roughly speaking, with that which is ascribed the first evidence of the existence of the human genus, and it afforded, to an unusual degree, those particular conditions which are considered to favor the deposition of precious ores. During this time, also, the breccia, with its finer portions, the tuff, became solidified. The pressure of the overlying masses of lava which at one time covered it, and the chemical solutions, which deposited fresh crystalline substances in the interspaces, converted the scoriaceous material into a compact mass, which eventually became solid rock as we now see it. The cooling of the intrusive bodies of lava caused them to contract, and thus developed lines of weakness along which the energies of the volcanic center developed fractures permitting the subsequent prolonged circulation of underground waters. The readjustment of this particular portion of the earth's exterior, which followed the cessation of volcanic eruptions, and the partial settling of the entire mass forming the Cripple Creek volcano, must have formed an extensive system of ruptures, which afforded lines of maximum porosity along which the gold-bearing solutions found passageways. Thus the hot waters which are supposed to dissolve out the metals from the deep-seated rocks were permitted to ascend toward the surface, where the release from pressure and the lowering of temperature forced them to precipitate their contents.

The activity of the geysers ceased; the warmth of the water bubbling from the springs gradually diminished; and at length the last vestige of the volcanic fires passed away. The mountain became as cold as the snow which mantled it each winter, and as still as the darkness enshrouding it nightly.

A Note on Hand Concentration Tests.*

By WALTER McDERMOTT.

In making a hand concentration test a good deal of skill is required to obtain a clean separation of mineral from gangue. The nearest to perfect work in this line is done by Cornish tin dressers on a vanning shovel, but few engineers have the practice and skill to obtain equally good results. Granting that the necessary knack is attained of throwing up the coarser particles of mineral from the waste, and of washing the latter back from the finest slime mineral, the difficulty remains of a practical separation of the two products for weighing and assaying. It is usual to wash the light waste off the shovel, placque, pan, batea or other surface employed, and it is here that special skill is required to prevent loss of fine mineral, and a consequent necessity for treating and retreating the tailings. To remove the concentrate from the waste in anything like a clean condition is still more difficult by any of the means usually employed, but Prof. Threlfall has lately called my attention to an exceedingly simple and effective method of doing this. An ordinary glass pipette is drawn down to a fine point, and fitted at the other end with a short piece of rubber tubing, to be held in the mouth, and so allow freedom of motion of the pipette. Having formed a head of mineral, this is sucked up into the pipette through the fine point (while the mineral is kept covered with water), and is then blown out into a separate dish. The operation of forming a fresh head of mineral and removing it by the pipette is repeated, until no more concentration can be effected. An extremely fine line of

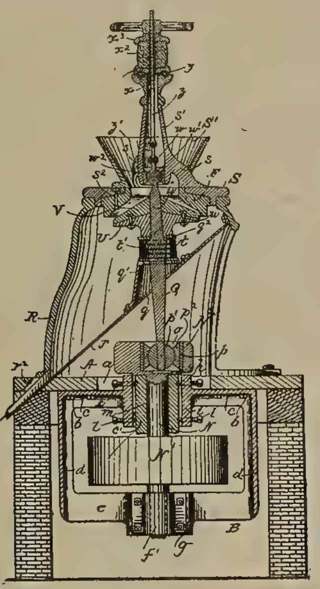
slime mineral can be thus picked up from the waste. The small quantity of waste which will be sucked up with the mineral in removing this can again be readily taken from the concentrates by shaking the latter up with a little water, washing back the waste, and using the pipette on this.

Mining and Metallurgical Patents.

Patents Issued July 17, 1900.

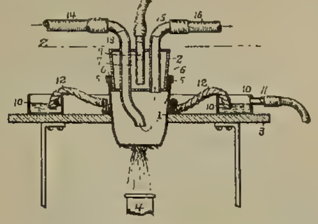
Specially Reported for the MINING AND SCIENTIFIC PRESS.

MACHINE FOR CRUSHING ORES.—No. 653,679; S. W. Kimble, New York, N. Y.



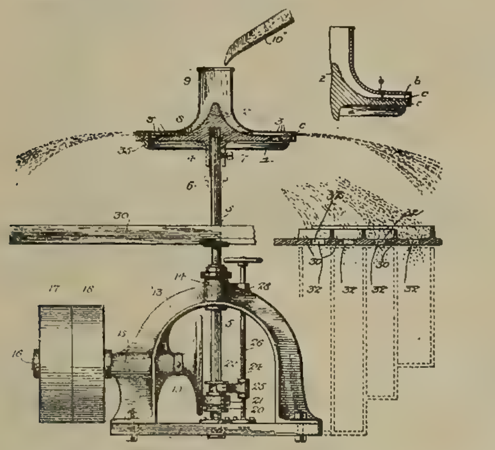
In a crushing machine, a muller crushing face which is of comparatively slight convexity, overhanging inverted mortar whose crushing face is of somewhat greater concavity, intermediate space between crushing faces diminishing in width as it recedes from center, muller shaft yieldingly supported from above and fulcrumed at upper end, means at lower end of shaft for imparting movement of nutation thereto.

COMBUSTION CRUCIBLE.—No. 653,823; P. W. Shimer, Easton, Pa.



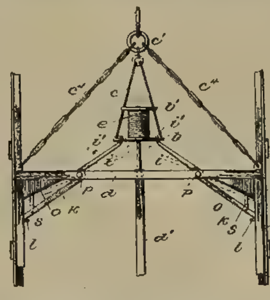
The combination with crucible 1, of stopper 2 closing the mouth of the crucible and bearing inlet and outlet tubes 8, 9, for the circulation of a cooling medium through the stopper, gasket 6 between the stopper and crucible, trough 10 for containing a cooling medium, and wick 12 leading therefrom and passing around the crucible.

CENTRIFUGAL ORE SEPARATOR.—No. 653,792; A. Dasconaguerre, Mexico, Mexico.



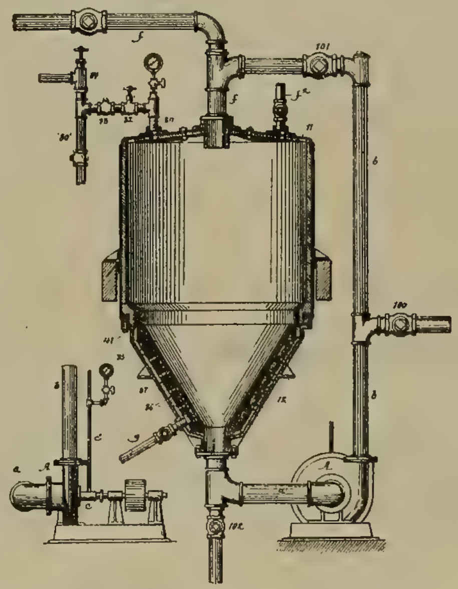
Centrifugal ore separator and concentrator, comprising revolving working surface, having central deflecting portion 2, and plane outer portion 3, in which are sunken tangentially disposed grooves a, thereby forming plane "lands" b on outer portion between grooves; and hood, having inlet, and disposed in proximity to working surface, but out of contact therewith, and conforming in its proximate side substantially to profile of working surface, thereby forming centrifugal air passage c above walls of grooves for blast of air induced by tangentially disposed grooves.

CLUTCH MECHANISM FOR MINE CAGES OR LIFTS.—No. 653,940; R. Schulz, Herne, Germany.



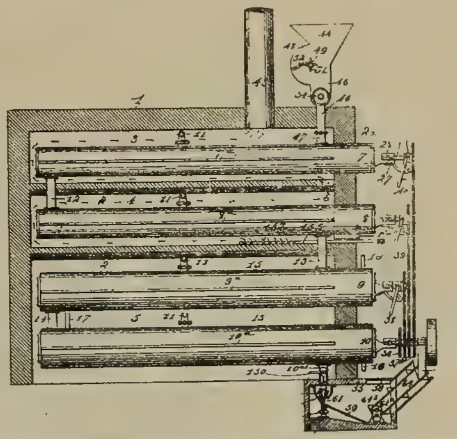
Combination, with cage or lift of corner pockets, hinged flaps beneath corner pockets, buffers located in corner pockets, central pockets, hinged flaps beneath central pockets, buffers located in central pockets and clutch levers pivoted to cage or lift having lower arms adapted to bear against flaps of corner pockets, and an angular crossbar adapted to bear upwardly against hinged flaps.

METALLURGICAL FILTER.—No. 653,684; F. H. Long, Chicago, Ill.



Combination with closed vessel having filter septum and regulated outlet port for filtrate beyond septum, of wash water pipe connected in hydrostatic column with vessel and external centrifugal pump joined at separate sides in closed union with opposite ends of vessel; journal box for pump axle furnished with water column pipe to counterbalance hydrostatic pressure at vessel.

RETORT FURNACE.—No. 654,066; R. E. Lauck, Kansas City, Mo.



Retort furnace, having front end projecting through furnace wall, comprising casing, having inlet port near front end of furnace, and outlet port at rear end, provided with internal bearing socket at rear end and bearing head provided with stuffing box at its front end, provided also with internal stationary comb, partition 21 forward of inlet port, nonconductor of heat filling casing forward of partition, shaft extending through partition and journaled in bearing head, and at its rear end in bearing socket, and provided with skeleton spiral conveyor, teeth of which pass between those of comb, and means to rotate shaft.

Stoping With Machine Drills.

In the issue of September 30, 1899, appeared a paper with the above title, read at the California meeting of the American Institute of Mining Engineers by B. L. Thane, Sumdum, Alaska.

In a communication to the secretary, discussing the paper, V. G. Hills of Cripple Creek, Colo., says: In continuation of the subject of the performance of "baby machine drills," presented by Mr. Thane, I submit the following records of work done with these drills in the Cripple Creek district of Colorado.

Two years ago the Anchoria–Leland mine began to use baby drills, and, to make the experiment more complete, began by purchasing two machines, of the same size, but of different make. The little drills were first used for stoping and upraising, in which they achieved at once an unqualified success. Soon after they began to be used for the smaller branch drifts and prospecting crosscuts, while the large two-man drills were still used for the main drifts. Now they have almost entirely superseded the large drills, since it has been found that they will do any ordinary work in the mine at less cost, both for labor and for powder, per ton of rock broken. The large drills, of course, make more rapid progress; but it is only where time is a specially important factor that they are now used.

The Portland mine, where, until within a year, only the large machines were used, is now using some small drills for stoping, and also for drifting.

Mr. Thane speaks of having two men to operate a baby drill, but in this district the baby machine is always worked by one man without help. Again, in Prof. Christy's postscript, the quoted extract from a letter of Mr. L. T. Seymour, the South African engineer, mentions a "2½-inch Little Giant," as though that were the smallest machine used in that region. These statements leave some doubt as to just what Mr. Thane means by "baby drill." To avoid any such uncertainty as to the present communication, I will say that the large or two-man drill in common use at Cripple Creek has a 3⅛-inch cylinder, while a few mines employ a 3-inch, and a few, in running large tunnels, a 3½-inch drill. What we call a baby drill here has a 2-inch cylinder and uses ⅞-inch steel for "starters" and ¾-inch for the long drills. Such a machine will handle drills 8 feet long, but holes are usually from 4 to 5 feet, and seldom more than 6 feet deep.

In this district these drills are always used with a bar, are commonly spoken of as "one-man drills," and are operated strictly as such. That is to say, the machine man has no help, either to set up or run his drill, does his own loading and blasting, and has to shovel away his own waste sufficiently to make room for his next set-up.

It is with such a drill, thus operated, that the following records were made: Total length of holes drilled in one shift of eight hours, 35 to 45 feet; average, 39 feet.

Of course, the amount of ore broken or the length of level driven in a given time or at a given cost depends on the thickness of vein or the size of headings, as well as the character of rock; and, therefore, the length of the drill holes in a given rock is the only fair test of the efficiency of the drill. But some additional particulars may be interesting. A man driving a drift or crosscut, 4 by 7 feet in section, puts in nine to twelve holes for his shift's work. Records by the month, without any allowance for breakdowns, sickness, holidays, etc., show an average of 4.3 feet to 4.7 feet per day with two shifts. A man frequently makes 3 feet a shift for many days in succession. In making an upraise 4 feet wide by 8 feet long a man averages 2 feet per shift, doing his own temporary timbering. Regular timbermen follow, 10 to 15 feet behind, providing a safe place to store the machine, hose, etc., at blasting time.

Shaft sinking with these little drills is illustrated by the following record: Size of shaft, 17.1 by 8.2 feet; depth of working, 900 to 1000 feet; no water. Two baby drills sank the shaft 5 feet every two days, the machine men working only one and one-half shifts in forty-eight hours, and an equal amount of time being required to remove the waste and put in a 5-foot set of timbers. Five "muckers," working one shift, are required to remove the waste. If any one knows of a record for cheaper sinking in a shaft of that size and depth, I should like to have it reported.

A company furnishing compressed air for general distribution in this district charges $2 per large drill per shift, where only a small number of drills are used. I understand that there is a considerable discount to mines using a large number. By actual test at the Anchoria–Leland mine we have found that a small compressor, which would just operate two 3⅛-inch drills, will run five 2-inch drills. Coal costs from $4.50 to $6 per ton, according to quality.

From the above data the cost of air for drills of different sizes and under different conditions may be estimated.

For intelligent comparison of results in mine working, something of the quality of rock and other conditions must be known. The rock in which the above work was done is a highly indurated and, in general, comparatively seamless andesitic breccia, hardness 6 to 7, specific gravity 2.4 to 2.7. Eight hours is a day's work for miners in the Cripple Creek district.

A Desert Gold Mine.

The Free Gold group, formerly the Golden Cross, is in Cargo Muchacho mountains, 25 miles northwest of Yuma, 14 miles west of the Colorado river in the extreme southeastern corner of California. The group consists of thirty claims; four are being worked—Golden Cross, Golden Crown, Golden Queen and the General Miles. The mines are in the surrounding mountains, the reduction works and the town of Hedges are in a valley 250 yards wide in the form of an amphitheater, opening toward the west and debouching on the Colorado desert. The mountains are of igneous origin, and while not high, present a rugged and serrated outline against the sky. These mines were discovered by Mr. Walters in 1885. Eight years afterward they were owned by Messrs. Young and Johnson, who sold them to the Golden Cross M. Co. for $40,000. The company erected a 40-stamp mill and worked on ore from the Golden Queen with good results. In 1895 the company completed a new 100-stamp mill and enlarged the pipe line which supplies water from the Colorado river. In 1897 the Free Gold M. Co. purchased the property for $1,000,000 and remodeled machinery, etc.

Every mining district has its peculiarities, and this one is not an exception to the general rule. There is but little quartz and the gold is found in micaceous and hornblendic schists and in pegmatite (graphic granite). There is also more or less orthoclase, syenite, diorite, chrysocolla, gneiss, epidote, common granitic rocks, etc., found in connection with the schists and pegmatite, and nearly all carrying some gold. The seams of pegmatite present a peculiar appearance as they traverse, in almost every direction, the dark hornblendic and micaceous formation. Instead of quartz-filled fissures the gold-bearing rock is in large deposits and in some places is quarried. On the day previous to my visit a blast of nearly two tons of powder was discharged which brought down about 150,000 tons of rock from the side of the mountain, which was being reduced in the 100-stamp mill at the rate of 500 tons a day. Owing to the comparative softness of the rock it is rapidly reduced, and it yields an average of $3.10 per ton and at a cost all told of 73 cents. The proprietors claim to be able to manipulate $1 ore at a profit.

The tailings have been accumulating from the time of the erecting of the first stamp mill, and are now estimated at nearly 1,000,000 tons. From the 100-stamp mill they have accumulated to a depth of from 40 to 60 feet. The cyanide plant consists of five percolating tanks, 45 feet diameter, 5 feet deep, each holding 320 tons; two stock tanks for solution, two gold tanks and two sump tanks used for the final deposit for solutions. There are also 200 individual zinc boxes and five pumps. The capacity of the plant is 320 tons daily. The tailings are handled entirely by machinery, are flushed out of the tanks with water and carried outside the camp through pipes. About 500 tons of tailings are deposited daily. By September the company expects to increase the daily capacity of the cyaniding plant to 1000 tons. The tailings from both mills average $3 per ton in value and are cyanided now at a cost of 33 cents, which will be reduced to 30 cents, or less, when the daily capacity is increased to 1000 tons.

There has been much development work done—about 12 miles of shafts, tunnels, drifts, crosscuts, wings, etc. The timbering is square Oregon pine 6x6 and 8x8 inches diameter. In the ledge running northwest and southeast the ore is higher grade than that produced in the other claims, which brings the average to more than $8 per ton; but, owing to the easy method of obtaining the ore, which is now being worked from the south side of the valley, the latter is considered most profitable. The ore is delivered in the mill at a cost of 25 cents per ton; the milling and all further handling costs 48 cents per ton. The output of bullion from these mines, including that produced by the cyaniding plant, is about $70,000 per month. Nearly 170 men are on the payroll, which reaches about $10,000 per month. They are whites, Indians and Mexicans, the latter largely predominating.

The improvements, including buildings, stamp mills, cyaniding plant, engines, crushers, pipe line, machine shops, assay office, etc., cost about $1,000,000. The machinery of nearly all kinds is of the best obtainable. For several years the mines have been in litigation, which it is claimed has cost the company some $400,000, yet these mines have paid all expenses of buildings, machinery, litigation, etc., and are now practically out of debt.

Well-equipped shops for doing all kinds of work needed about the mines are found here, with skilled workmen to conduct them. They include machine shop for repairs, blacksmith shop, carpenter shop, mine-timbering shop where all mine timbers are framed by machinery, driven by steam; all kinds of needed work in wood and iron is done here except castings. A dynamo, capacity 500 fifty-candle power, supplies electric lights for the mines, reduction works and wherever else needed.

The company owns ten engines, one crusher of 1000 tons capacity and two crushers of 200 tons capacity. They also have a complete pumping station at the Colorado river, where a 175 H. P. Corliss engine forces the water through 14 miles of pipe to a reservoir which holds 300,000 gallons, 100 feet above the town. Owing to its extreme dryness, the ore requires about 1000 gallons per ton in reducing it. Wood is used for fuel and is bought by the ton. It is palo fierro or iron wood, procured on the desert. It is as hard and as heavy as lignum vitæ and looks like that wood. It is delivered at the mines for $3.75 a ton.

The stamp mills are among the best and the largest in number of stamps of any in the State. The 100-stamp mill runs day and night. It is said to have lost but eighteen hours in three years. The stamps have 6½ inches drop and crush five tons of ore each per day of twenty-four hours. They are driven by a compound Corliss marine engine of 400 H. P., with four 100 H. P. boilers; an air compressor furnishes power for the drills. The 40-stamp mill has been idle for a time awaiting the removal of the accumulated tailings, when it will be started up again, and the company has in contemplation the addition of another 100-stamp mill, making 240 stamps in all.—Condensed from article by S. Bowers in Los Angeles Herald.

Copper Alloy for Amalgamating Surface.

At the California meeting of the American Association of Mining Engineers a paper was read on "Plate Amalgamation," by A. J. Clark of Lead, S. D. In discussion of the subject, H. Van F. Furman of Denver, Colo., in a communication to the secretary, says that, in the papers and discussions on copper-plate amalgamation and the accumulation of amalgam on copper plates, he has noted nothing regarding the efficiency of copper alloys as amalgamating surfaces.

He then quotes from T. K. Rose, who has suggested an alloy to be used for amalgamating plates, consisting of copper 60%, zinc 40%. Dr. Rose asserts that this alloy catches the gold well as soon as the plate is amalgamated, not requiring to be covered with gold, or silver, amalgam, before beginning to do good work; that the amalgamated surface is superficial; the mercury does not sink in so far as into the pure copper plate, with the result that it is easier to clean up; but pointing out that, as the alloy holds little mercury, it can not absorb much gold and must be frequently cleaned. Note is made that the mercury on such a plate does not "sicken," which may be due to the electrolytic action of the copper-zinc couple which sets free nascent hydrogen, reducing the compounds of mercury and other metals which have been formed, which would seem to make such a plate suitable for ores containing large amounts of heavy sulphides or arsenides. Claim is made that the verdigris formed on copper plates when grease or other impurities are present in the battery water do not appear when this alloy is used, and that such discolorations as may occur thereon can be better removed by a dilute sulphuric acid than by potassium cyanide. Dr. Rose cites the case of the Saxon Mill, New Zealand, where the copper plates formerly required seven pounds of cyanide, costing $2.80 per month, to keep them clean; while the alloy plates, by which they were replaced, were kept clean by five pounds of sulphuric acid per month, costing 50 cents. He notes, however, that in the treatment of the highly acid ores, which, having been weathered, contain large quantities of soluble sulphates, or, where the battery water contained acids, that the regular copper plate is less affected than the alloy, over which a scum is rapidly formed in such a case. In dressing the new alloy plates the following method is adopted in New Zealand: The surface of the plate is scoured with fine, clean sand; then it is rinsed with water and washed with a dilute (1 to 6) solution of sulphuric acid. Mercury is then applied and rubbed in with a flannel mop, until it wets the surface of the plate (i. e., amalgamates with it) in one or more places, after which the mop is given a circular movement, passing through these spots until the amalgamation of the surface spreads from them over the whole plate.

(TO BE CONTINUED.)

California Petroleum.

At a recent meeting of the Pacific Coast Gas Association in San Francisco, State Mineralogist Cooper contributed a paper on California petroleum, that, in addition to the articles furnished by him to the Mining and Scientific Press on the same subject, contains practical information of general value. In this last paper Mr. Cooper directs attention to the fact that petroleum oils from different oil fields of California differ widely in physical characteristics and chemical composition. They may contain, chemically combined, sulphur, oxygen and nitrogen, and in widely varying amounts, while in some rare instances these elements may be absent. Oils in the same stratum and a short distance apart may vary greatly. Frequently a well when it first yields will give an oil of a lighter gravity than that which it will yield when it has been pumped for some time. We may, therefore, look upon California petroleum as containing carbon hydrogen, sulphur, oxygen, nitrogen and other substances in minute quantities; these combinations being great in number and complex. The boiling points and melting points of the bitumens are altered very considerably by the presence of sulphur, oxygen and nitrogen.

California petroleum is a mixture of a large number of hydrocarbons, and a large number of compounds containing hydrocarbons combined with sulphur, oxygen, nitrogen and other elements.

All the hydrocarbons and their compounds with other elements in California crude petroleum are volatile, some such as benzine extremely so, while asphaltum volatilizes with great slowness. Natural gas is a volatile part of petroleum. Like coal, the bitumens, oils and asphaltum, through decomposition, are constantly giving off carbureted hydrogen.

One of the reasons why California petroleum has such a high gravity is because the formation in which it occurs is tilted and broken, permitting the escape of the gases.

When California petroleum is evaporated by atmospheric influences, the sulphur, oxygen and nitrogen compounds remain and are concentrated, and, if the process is continued long enough, solid asphaltum is formed. After asphaltum is formed evaporation takes place with exceeding slowness. Heat accelerates evaporation. The evaporation from an oil tank built under ground and kept at a temperature of 60° Fahr., is far less than from a tank built above the ground and exposed to the sun's rays, which may often reach a temperature of 130° Fahr.

Advantage is taken of the fact that asphaltum is nearly an unalterable gum to make many constructions in which a plastic and unalterable cement is required. Usually California petroleum contains from 5% to 9% of sulphur.

Some wells in California produce oils containing paraffine and are valuable for producing illuminating oil.

On the Laguna Extension, or Zaca rancho, in Santa Barbara county, there are large deposits of bituminous sand exposed upon the surface. On any one of several 20-acre tracts at this place the dimensions of the exposures of the bituminized sand would show that it contains 8,000,000 barrels of heavy petroleum of the consistency of molasses.

To make one barrel of that material must have taken eight barrels of ordinary petroleum before evaporation; so that on each 20-acre tract is now the remains of 64,000,000 barrels of petroleum oil. In California, as elsewhere, there are probabilities of a very small territory producing great quantities of oil.

Unaltered rocks of California cover an area of over 40,000 square miles. Bitumens occur in all geological formations, from the plutonic, metamorphic, or igneous rocks, up to and including the quatenary. It is found saturating strata of sand and seamed shale, and as many as ten beds of shale can be seen on the eroded sides of some of the anticlinal ridges of the Coast Range. These sand beds are very irregular as regards their thickness and the distance intervening between them. Some are a few feet in thickness, while others exceed 400 feet, and the shales are from a few feet to over 500 feet in thickness.

When several sands are to be seen on the side of a mountain, or when they can be traced upon the surface of the earth by their outcrop, if bituminized at all, the bitumen will generally be in the geologically lower beds, and when a sand contains bitumen the underlying sand beds are also liable to contain bitumen.

At the present time nearly all the wells that are being bored are in the vicinity of surface indications, to wit: oil seepages, outcrops of bituminous rock and gas blow-holes, all of which are signs that the reservoirs of petroleum are leaking, owing to insufficient cover. At present the wells are generally shallow, but they will increase in depth in time, as they have done in other fields. The day is not far distant when oil territory will be selected by geologists on account of favorable structure and position, irrespective of surface bitumens. The wells in this territory will have to be drilled to a greater depth, but, when productive, will yield light oil.

The large area and the thickness of the unaltered rock and the great thickness and number of the oil sands in California causes Mr. Cooper to express the belief that the yield of oil in California in future years will be enormous.

A comparison of the consumption of fuel oil with that of coal shows 3.33 barrels of fuel oil to be equivalent to one ton of good imported coal. Figuring oil at $1.40 per barrel and coal at $7.50 per ton in San Francisco, it shows the cost of oil to be $4.66 as against $7.50 for its equivalent in coal. Moreover, the labor required to operate with coal is far greater than with oil, in many instances being nearly double.

The perfect cleanliness of fuel oil and the ease and simplicity of supply and regulation, makes it a most desirable substitute for coal. As long as coal remains at $7.50 per ton in California, it can not be expected that oil will fall below its present price; not, at least, for some time to come.

In the year 1899 there were 1,740,027 tons of coal imported into the State of California; to supplant this 5,792,238 barrels of oil will be required. As the supply becomes more permanent the uses of fuel oil will multiply.

The removal of the gasoline, benzine and illuminating oil leaves an oil with a high flashing point, which would be less dangerous to use in a locomotive and otherwise than a fuel oil of low flashing point. The removal of the water also improves the oil for fuel purposes, as it does not have to be evaporated by the fire.

At present the market value of asphaltum is too high for it to be economically used for either the manufacture of gas or for fuel purposes. The large percentage of sulphur in natural asphaltum or in that obtained as a residue in the distillation of crude petroleum, make them an undesirable fuel. During combustion with oxygen the sulphur combines with the oxygen to form sulphur dioxide. Sulphur dioxide, in absorbing water or the vapor of water, changes to sulphurous acid. By oxidation the sulphurous acid is changed to sulphuric acid, which may lodge on the surface of the boiler and attack the iron, forming sulphate of iron. Through this action the sulphur contained in the asphalt is a cause of corrosion in boilers.

Owing to the presence of sulphur, the fuel value of asphaltum is small when compared with the other hydrocarbons contained in crude petroleum. The laboratory and practice show that the distilling, manipulating and purifying of crude California oil must be totally dissimilar and different from the methods in use in Pennsylvania, Canada and elsewhere. Most of the crude California oil should be distilled twice. From experiments made it would appear that the vapors of the lower hydrocarbons during distillation are contaminated by the decomposition of the sulphur contained in the higher hydrocarbons, such decompositions being caused by heat.

The asphalts obtained by the distillation of California petroleum contain from 4% to 7% of sulphur.

California crude petroleum is composed of a number of hydrocarbons and hydrocarbon compounds mutually dissolved one within the other and having different boiling points. Owing to this they can be fractionally distilled so as to separate them into fractions having the following commercial names and physical characteristics:

Crude California Oil 26° Baume. Distillates Commercial Name.	Approximate Baume.	Specific gravity.	Weight of one gallon in pounds.	Percentage Obtained.
Gasoline	75	0.6820	5.69	3
Benzine	63	0.7253	6.04	4
Illuminating	45	0.8000	6.66	13
Mineral sperm	38	0.8333	5.94	8
Gas distillate	28	0.8860	7.38	21
Light lubricating	26	0.8974	7.48	8
Neutral	23	0.9150	7.62	10
Heavy lubricating	21	0.9271	7.72	5
Valve lubricating	15	0.9655	8.04	4
Asphalt		......	....	11
Loss		......	....	13
Total				100

The following are the percentages of distillates obtained by the first distillation from any crude California oils:

	Per Cent.	Per Cent.
Naphtha	Traces	15.
Illuminating	6	27.
Gas distillate	16	30.
Lubricating	20	52.
Asphalt and loss	7	25.

In the first distillation the following are the temperatures at which the following distillates are distilled:

Crude naphtha	Traces	150° C.
Iluminating distillate	150°	300° C.
Gas distillate	300°	350° C.
Lubricating	350°	....

Owing to the highly complex composition and great diversity of California oils, the above figures are to be considered only suggestive.

Fifty H. P. "Union" Hoist.

The illustration on page 89 shows the latest improved 50 H. P. double-cylinder, single-drum mining hoist made by the Union Gas Engine Co. of San Francisco. One of this size was installed at the Pacific Coast Borax Works near Daggett, Cal., last February, and a duplicate of it has been shipped to the same party, making nine "Union" hoists on their property, the first of which was installed in 1889, is still in use, and is said to have been the first gasoline mining hoist ever built. During the past week a 50 H. P. "Union" hoist was shipped to the Ophir Mining & Milling Co., Stateline, Utah, and one of 25 H. P. to the Vulcan Copper Co., Siegliton, Nev. The new premises of the company at the corner of First and Clementina streets, San Francisco, are already taxed to their utmost capacity by the demand for the "Union" engines for all purposes.

Vaporizing Attachment for Economical Water Supply for Water Jackets of Smelting Furnaces.

Two engravings on page 89 accompany this description of a rectangular and round smelting furnace, respectively, fitted with Nesmith's patent water vaporizing attachment for the economical use of jacket water for smelting furnaces. This appliance was designed originally for a plant that was to operate in a district where great scarcity of water prevailed, and its success from the start for the purpose for which it was made, and the improvement in the even working of the furnace, led to its further advancement. It is manufactured by the Colorado Iron Works Co. of Denver, Colo., who indorse and recommend it for all classes of water-jacketed furnaces, regardless of water supply.

Advantage is taken of the latent heat of steam, which is 966 heat units, 1 pound of water at 212° F. absorbing 966 heat units in vaporizing to steam at 212° F. This data is for sea level. Water at the altitude of 1 mile boils at 202° F. Allowing water to be supplied to the jackets at 62° and discharged at 202°, there has been absorbed by each pound of water but 140° of heat units, which is all that it is possible to get where water instead of steam is discharged from the jackets. If vaporized to steam from initial temperature of 62°, there is for 1 pound of water 140 units to boiling, plus 966 units to steam at 202° indicated temperature, equaling 1106 heat units, carrying off 966 units of heat in steam from each pound of water, without making the jackets any hotter than if they were discharging boiling water, the proportion of gain or water saved thus being 966 heat units: $966 + 140 = 1106 \div 140 = 7.9+$, thus using 7.9 times as much water if discharged boiling from the jackets as would be used if vaporized and discharged as steam, the jacket no hotter in vaporizing the water to steam than by simply discharging boiling water from it, using about one-eighth the amount of water by vaporizing it than would have been used by discharging it boiling from the jackets; and as water is seldom discharged so hot as 202°, the amount required for vaporization will fall below one-eighth that usually used for cooling, and will have kept the jackets at the same temperature in the one case as in the other.

Instead of taking water direct from source of supply direct into jackets, a large circular pipe or tank surrounds the furnace, in connection with or independent of the bustle pipe, which receives the entire supply near its bottom. The lower jackets are connected in their respective positions from the bottom of this tank; the jackets are connected with each other — top, bottom and sides—and the water is discharged from the top of upper jackets into the circular tank at a point about its center and just below the overflow standpipe inside, the tank being three-fifths full of water all the time. The bottom of this tank is above the highest water jacket, making perfect the circulation of water in jackets. A large pipe is open to the atmosphere, through which the steam from the tank is exhausted. The overflow pipe from tank is trapped to prevent the escape of steam on furnace floor, from which a very small stream is allowed to run to waste, visible at all times to workmen as evidence that a sufficient supply of water is being received into the furnace, and also that the appliance is working satisfactorily. A regular water glass indicator is also placed on the tank, showing the water level at top of standpipe overflow inside as a secondary precaution.

This appliance is considered by its makers to demonstrate that about nine-tenths or more of the water usually used in a furnace can be dispensed with, and still further great advantage derived from the uniform, even temperature of the jackets at all times and the diminished liability of their cracking by reason of cold water being discharged into them. The evenness of the working of the furnace under these conditions is marked. The jackets are always full of water at boiling point, but steam is made only in the vaporizing tank, from which it is discharged into a tank for condensation and further use, or to the atmosphere, and which, if the water supply valve is properly adjusted, need be the only water used. Pumping expense is thereby greatly reduced.

In the case of the round furnace, from which one of the engravings is made, the supply water is that only which comes through the cooling chamber of a 44 H. P. gasoline engine, and is received into the tank and thence to furnace at practically the boiling point. The apparatus is considered an important improvement to any class of water-jacketed furnaces.

MINING SUMMARY.

ARIZONA.

MARICOPA COUNTY.

At Kelvin has been made a successful trial test of the Ray Copper Co.'s mill; the concentrates run from 35% to 50%. The railroad is bringing down 300 tons of ore daily.

At the Phœnix mine, near Phœnix, S. Huntington will put in a cyanide plant to consist of two separator tanks and four leaching tanks 30 feet in diameter, having a daily capacity of 125 tons of ore. The ore having passed through the mill will be pumped into the separator tanks by a sand pump. The water will run back to be used again in milling operations, and the contents of the separator tanks will be removed from them at the bottom and carried by means of a car over the leaching tanks and dumped into them.

MOJAVE COUNTY.

(Special Correspondence).—The Tennessee mine is pushing its shaft as fast as possible, hoping to get the mill running as soon as completed and connection made with the main shaft.

Report is that the O'Connor and Minnesota mines and mill, owned by John Barry, which have been large producers and shippers of ores and concentrates, have changed hands.

The Silver Age, operated by Mr. Loy, is reported in ore.

The present month will be the banner month for the Lucky Boy. The whim is in place and the mine is getting ahead of present facilities for packing ore down the mountain.

Mr. McDuffy is getting out ore from the Rainbow for shipment.

Fergusson, Flynn & Fergusson are taking out ore from the Redemption for shipment to the smelter. The ore carries fair values in copper, gold and silver. Fergusson & Sons are the owners of this property, also of the Clyde south extension of same, which they have leased to others, and work will soon begin.

The Watchman Bros. have made a shipment from their property to Kingman. Results were very meager on account of charges on medium-grade ores. They are now preparing to ship in carload lots.

There are other properties working in a small way which may turn out mines in the future. What is wanted here is mining capital, not ranchers, who are afraid to develop unless a prospect gives two dollars for one invested.

Chloride, July 23.

YAVAPAI COUNTY.

The miners employed by the United Verde Co. are preparing to organize a miners' union.

The hours in the United Verde mine, Jerome, have been cut down from ten to eight for all men working underground.

CALIFORNIA.

AMADOR COUNTY.

The Kennedy M. & M. Co. have secured a reduction from the assessment of $169,000 placed upon it by the assessor of $50,000.

Dispatch: At the Mutual mine, between Sutter Creek and Amador City, the shaft is 450 feet deep. A drift is being run to tap the ledge 125 feet farther. ——At the Oneida mine the old and new shafts are connected by a 350-foot upraise. It is thought the stamps will be dropping in the new mill by September. ——W. A. Knapp, Supt. Hepburn or Bellwether mine, expects to soon resume work.

BUTTE COUNTY.

At Forbestown the Gold Bank M. Co. is increasing the mill capacity from forty to sixty stamps. Seventy-six men are employed. Supt. Stow tells the Mercury that to operate the increased mill will require only eighteen more men than now employed and the cost of milling will be reduced 35 cents per ton.

Eastern men have the Miller mine, 2 miles south of Forbestown; superintendent, George Shkoff. A new three-compartment shaft, $4\frac{1}{2}$x$12\frac{1}{2}$ feet, will be sunk 230 feet and drifts run at that depth. He expects to have a 20-stamp mill running within a few months.

CALAVERAS COUNTY.

The Demarest mine at Fourth Crossing is closed till the rains come again.

A strike of unusually rich gold ore is reported at the Angels mine last Wednesday below the 700 level. The ledge is 18 inches wide.

The Del Monte group of mines, recently incorporated, is near Railroad Flat. The group consists of six claims and mill site, equipped with a 10-stamp mill, of which five stamps are in place and have been in operation during the past year. There are five veins crossing this group, showing a width of from 12 inches to 4 feet. The principal work has been done on the Del Monte or Old Prussian Hill claims. The main tunnel is 900 feet in quartz.

EL DORADO COUNTY.

(Special Correspondence). — A recent item got the Union and Schoolgirl mines mixed. The facts are that the Union G. M. Co. owns a large territory—about twelve full mining locations. On the extreme northwest of this property a large and very promising lode or vein of pay ore was discovered last year. It was opened and developed and a 20-stamp mill was erected thereon by the Union Co. It was one-quarter of this property, incorporated as the Schoolgirl mine, that was sold by the Union Co. to Messrs. Williams, Burns & Bixler. It has no connection whatever with the Union mine or its 20-stamp mill.

Placerville, July 25.

The Table Rock mine, on the American river, is being unwatered and reopened by Fuller & Stephens.

The mill at the Boulder has shut down, owing to a scarcity of water.

The shaft at the Mt. Pleasant is unwatered to the 600 level.

At the Omo mine the 10-stamp mill is running. The mine is being developed by tunnels.

The Richmond mine, situated at the forks of the Cosumnes, has suspended operation.

At the Little Gem mine, near Volcanoville, three eight-hour shifts are driving the tunnel on the ledge from the 200-foot level.

On the Alpine, near Georgetown, the shaft is over 120 feet in depth.

The Mt. Pleasant mine, near Grizzly Flats, recently purchased by Brown Bros. of Oleta, is now free of water to the 600-foot level.

At the Clark gravel mine, near Placerville, preparations are being made for a new mill.

Work has been entirely suspended at the Esperanza mine, near Garden Valley, the property of the Garden Valley G. M. Co., the mine filling with water. The company is selling the machinery.

GLENN COUNTY.

One hundred and eighteen oil claims have been filed by the Great Northern Oil Co. in the Stony creek mineral district.

HUMBOLDT COUNTY.

The Sugar Bowl mine, near Hoopa, is sold by J. W. Humphreys to Douglas Bros.

KERN COUNTY.

In J. B. Treadwell's well No. 10, section 3, township 29 south, range 28 east, the drill has struck a flow of gas and oil which shot 70 feet into the air, reaching the top of the derrick.

At Johannesburg ore from the Little Butte mine (twenty tons) gave $2400.

LOS ANGELES COUNTY.

The Los Angeles Land Office reports large numbers of scrip locations being filed since the recent decision of U. S. Circuit Judge Ross favoring that class of locations. The scrippers are filing over lands in the various oil districts where placer oil locations have been made.

MONO COUNTY.

At Bodie the Standard Con. M. Co. has bought the Bodie T. & M. Co.'s property, which includes a 10-stamp mill.

Miner-Index: The bullion yield of the Standard Con. mine of Bodie for the past fiscal month was the largest of any previous month for about three years. The net proceeds in gold coin from the sale of the bullion last month were $45,794.55; expenses, $30,878.88; net profits, $14,915.67. The surplus now on hand in the treasury of the company and invested in U. S. bonds amounts to $158,930.57.

NEVADA COUNTY.

J. E. Doolittle has sued the Gold Run Gravel Co. and had an attachment levied on the company's property for $10,880.59.

The Champion M. Co. of Nevada City will build a new sand plant below its mines at Deer creek under the direction of O. Brown.

In Grass Valley the Tulle Belle is to be developed. J. R. Tyrrell is Sec'y and A. Blackburn Supt. Sinking has begun on a two-compartment shaft.

Union: Haskins and Eldridge have begun work on the Franklin, Lone Star and Goose Neck mines in Willow valley. From a reservoir on the hill above the Franklin water will be conveyed 2000 feet through pipes to the mine. They have the machinery on the old Fountain Head gravel mine on the Washington ridge, which will be used at the Franklin.

PLACER COUNTY.

The R. A. Watson quartz mine at Shady Run has been bonded by a Stockton company and the work of sinking 100 feet begun.

SAN BERNARDINO COUNTY.

Mining Review: Work of every kind at the Copper World mines, the property of the Ivanpah Smelting Co. near Manvel, has been stopped and the men paid off and discharged. J. D. Hanbury, the president of the company, tells the Review that the stoppage is but temporary.

At a recent meeting of the Southwestern Miners' Association in Los Angeles the necessity for the placing of signboards on the roads on the desert, so that the miner, prospector and traveler can tell when he is on the right road, caused a decision to take steps to provide a system of signboards at road crossings, road forks and other points, giving brief directions as to both roads and water.

SAN DIEGO COUNTY.

At a depth of 600 feet the Monarch Oil Co. has found drops of oil on the water brought to the surface with the sand bucket. The drill is still working in a blue shale.

The Owens mine, Julian district, is reported shut down and owners to settle their differences by going to law.

SHASTA COUNTY.

The Mountain Copper Co. will burn crude oil at its Keswick smelting plant. Two carloads have already been received from southern California.

Manager McDermott of the Afterthought mine will put in new pumps and cages at Furnaceville. The shaft is down 200 feet.

SIERRA COUNTY.

Notice of location of water rights is recorded in the recorder's office, in which 20,000 inches of the waters of the North Yuba river are claimed, to be diverted at a point west of Goodyear bar, for domestic use and for generating electric power at Alabama bar, 12 miles below Goodyear bar.

SISKIYOU COUNTY.

R. Van Brunt, near Happy Camp, has made a cleanup of forty days' work and got $8000.

Supt. Josselyn of the Greenhorn Blue Gravel No. 2 mine will soon resume work in the mine. He intends putting in a larger pump.

T. J. Nolton, who has been down at Happy Camp, Seiad and Indian creek, along the lower Klamath, says nothing is doing in the way of mining, all the streams being short of the usual water supply, owing to the slight snowfalls on the mountain summits.

TEHAMA COUNTY.

The Tehama Oil Co. is boring for oil at Red Bluff.

TRINITY COUNTY.

The new works which the Brown Bear Co. are putting up three-quarters of a mile from Deadwood will be in running order by Nov. 15.

TUOLUMNE COUNTY.

Work has been resumed on the dam above Horseshoe Bend, across the Stanislaus river, to turn the water to the flume and ditch to be used by the Melones Co. at their mine 2 miles below.

The assessment of the Columbia Marble Quarry is reduced from $37,500 to $7500.

Independent: On the east belt the Starr King mine is being unwatered; under a $25,000 bond.——The Providence shaft is being sunk from the 700 to the 800 level.——Work is in progress in the Dead Horse mine between the 1400 and 1500 levels on an ore body.——The Seminole property is under a working bond and is a producer.——D. Pennington has bonded his property at the head of the Marlowe diggings to San Francisco men for $18,000. ——At the Blue and White Star mines on the North Fork a tunnel is in 270 feet. The vein is 8 feet wide and averages $9. ——At the Grizzly mine sinking is under contract from the 700 to the 800 level.

YUBA COUNTY.

The Blue Gravel M. & M. Co. has levied an assessment of 5 cents per share, delinquent Aug. 24.

COLORADO.

(Special Correspondence).—A review of the movement of ore during the months of June and July from the various districts of the State, and in the State as a whole, shows a perceptible falling off of shipments, as compared with those of six months ago. The one factor responsible for reduced production in Leadville, Aspen and Creede is the decline in the price of lead. That metal, at the price that prevailed before the decline, constituted the redeeming element in the operation of some of the low-grade properties. In such mines the percentage of silver is low and the recent advance in the price of the latter by no means compensates for the fall in lead. In Aspen district the tonnage has fallen from about 12,000 to a little over 8,000 per month, while in Leadville there is a marked reduction in the tonnage of the siliceous, oxidized and sulphide ores, as well as of zinc-lead sulphides, in which lead values preponderate. About 75,000 to 78,000 tons per month are produced in the latter camp, of which about 30,000 tons are treated by local plants and about 46,000 to 48,000 tons shipped out.

Shipments from the San Juan districts hold very uniform, there being no perceptible falling off from their regular tonnage. The bulk of shipments from that section is in concentrate form, in which lead values are important, but in which gold is chief, as regards the more important producers.

The falling off of Cripple Creek's tonnage of about 33% is due to entirely different causes, as virtually neither lead nor silver are produced there. The smelting ore from that district is now running at the rate of about 8000 or 9000 tons per month, the falling off being due largely to the necessary curtailment on the part of various big mines, pending the installation of new plants of machinery and the delays resulting from various reorganizations and consolidations. The same causes apply to reduced shipments to the chlorination and cyanide plants; and, in addition, it may be cited that, with the rapidly increasing capacity of the mills of that class, miners who have large reserves of milling ore think lower treatment charges and lower freight rates are in sight. WASCOTT.

Denver, July 17.

The Denver & Rio Grande Railway Co. has commenced the construction of a branch from Texas Creek, on main line, 27 miles southward, through West Mountain valley to Silver Cliff, Custer county; thence into Huerfano county. Other branches have been mapped out, which will be built after the completion of the Texas Creek line. A construction company has been organized which will attend to the building of all branch lines of the D. & R. G. system.

CLEAR CREEK COUNTY.

(Special Correspondence).—The ore tonnage shipped from Georgetown is not up to that of a year ago, though the grade continues characteristically high. Information obtained at the samplers indicate that about 700 tons per month are shipped out, which averages about 195 ounces silver, 17% lead and $\frac{16}{100}$ ounce gold. The two distinctly lead mines of the district are the Stevens and the Mendota, the others being more of the nature of gold and silver producers. A recent shipment of Stevens ore ran 73% lead. The Aliunda is keeping up a fair record of lead and silver. The Centennial, a gold, silver, lead and copper property; the Griffith, of same character; Big Indian, silver, gold and copper; Cory City, silver, lead and gold; the Pelican–Dives, Pay Rock, Seven Thirty, Bismarck, Dunderburg and Frosburg, producers of silver, gold and lead, are all operating.

On Democrat mountain the mines working are the Astor–Scepter, Sunburst, Silver Glance, Polar Star, New Boston, Muscovite, Mineral Chief and Smith & Wesson, all silver-lead producers.

In East Argentine district the shippers are gold and silver mines, and comprise the Independence, Johnson, Mendham, Santiago, Commonwealth, Paymaster, World's Fair, Three Nations and Marietta.

In Empire district the Tenth Legion, Gold Dirt, Gold Bug, Conqueror, Gen. Harrison, Empire City, Atlantic and Silver Mountain are active, all shipping at present about 200 tons per month.

At Silver Creek the Jo Reynolds and Nabob yield about fifty tons per month of silver, gold and lead ore.

The Millington, Bellevue–Hudson, Dictator and Lincoln at Lawson ship about fifty tons per month.

Georgetown, July 18.

(Special Correspondence).—The Colorado & California Shareholders' M. & M. Co. now controls several groups of properties, including the Crown Point & Virginia, Franklin and Lady Franklin, as well as the Wilkie mill on Clear creek and the Allen mill on Chicago creek. The Wilkie is operating now at a capacity of about fifty tons per day and the Allen mill will be enlarged to sixty tons, both of which are expected to operate on ores from the group of mines mentioned. The present tonnage handled at the Wilkie mill comes from the Crown Point & Virginia. The lower levels of the latter are expected to be in condition to produce by August. On the Franklin group a tunnel which has been driven 800 feet will be extended 600 feet farther and a shaft will be sunk from the surface. W. H. Knowles is manager of the consolidated mines and mills mentioned.

The following mills are operating near Idaho Springs:

	Tons per day.
Jackson	40
Wilkie	50
Newton	50
Silver Age	30
Elgin (at Freeland)	20
Mattie	15

The new Senator mill near Dumont is well along toward completion. The Mixsell mill will resume operating in a few weeks, or as soon as the dam shall have been rebuilt. The latter was washed out two months ago. WASCOTT.

Idaho Springs, July 19.

EAGLE COUNTY.

The Beldin mine, Battle mountain, above Red Cliff, is to be started up; C. F. Bedell, Supt.

GILPIN COUNTY.

Register-Call: At the Perigo property, operated by the T. L. & M. Co., employment is given to sixty men. Eighty tons of ore are daily treated at the new rapid-drop stamp mill; E. M. Messiter, Supt.——Supt. Bowden has twenty men at the Gold Dirt mine; daily shipments of mill ore to the Peterson mill at Gilpin, twenty-five tons.——H. P. Lowe of Denver has a lease and bond on the National mine, Quartz hill. The shaft, 400 feet deep, will be sunk 200 feet deeper.

GUNNISON COUNTY.

At the Black Copper mine the shaft is to be sunk 200 feet; the vein is 20 feet wide and the ore is silver-bearing gray copper. Manager Young has men developing it.

HINSDALE COUNTY.

Near Lake City the Hiwasse Co. has leased the site of the old Crook smelter and will build a mill thereon, capacity sixty-five tons, and a bucket tramway over 3 miles long.

D. A. Farrell will put a six-drill air compressor in the Lellie mine.

LAKE COUNTY.

(Special Correspondence).—The Rock Hill Con. M. Co. management is drifting from the shaft northwesterly toward the grounds of the Royalty Co., driving into a streak of lead-carbonate ore 15 inches wide.

The Valentine M. Co. work struck porphyry in shaft at 300 feet depth; a drill was sunk from bottom of shaft 150 feet deeper, cutting into lime. The shaft will be sunk to the lime stratum. A third of the stock issue of this company was sold in Leadville for $75,000. They have a five years' lease on about 60 acres on Rock Hill.

The Royalty Co. are pushing work at the two Revenue shafts. At No. 1 drifting goes on and at No. 2 they are sinking.

The Neusitz shaft, near High School building, has reached 150 feet depth, being at present in lake-bedding rock.

The Home Extension M. Co., which has acquired mineral rights of various lot owners to grounds under Harrison avenue, are to sink a shaft on Oak street, between Second and Third streets. It is understood they paid at the rate of $8000 per acre for the mineral rights to the grounds thus located.

Leadville, July 21.

RIO BLANCO COUNTY.

Reports from the gilsonite claims, recently bought by Eastern men from Utah people, are that they have been "jumped," under the contention that they were originally located as placer claims, when in reality the gilsonite is deposited in well-defined fissures. Messrs. McManus of Maine are said to have paid $100,000.

SAGUACHE COUNTY.

Near Crestone, Mgr. Granville of the San Isabel Co. will have the 50-ton mill in operation by Aug. 15. He has men building a tram to carry ore from the mines to the mill. He has on the ground a 6-drill compressor.

SAN MIGUEL COUNTY.

In Telluride district, at the Smuggler mills both plants have a daily capacity of 300 tons.

At the Four Metals M. Co., Turkey Creek basin, Manager Shockley is doing considerable development work and is making good headway in the matter of bringing the property up to its best efforts this season.

D. Scott built a small cyanide plant near Telluride to test the values of the placer ground there.

At the Peck cyanide plant six new tanks of 100 tons capacity each will double the capacity of the plant, giving it 200 tons; thirty-five men are employed.

The Pennsylvania tunnel, driven by the Smuggler-Union, is now in nearly 2000 feet.

The Liberty Bell is employing sixty-five men at the mine; 300 tons ore can be daily treated.

TELLER COUNTY.

The Rocky Mountain G. M. Co. has let a contract for an additional 100 feet of sinking.

The June output of the Independence mine was $500,000.

The Victor G. M. Co. has leased the Victor mine to F. Y. Osgood. He has twenty-five men at work. Since the inception of the mine dividends amounting to $1,155,000 have been paid by the company. The property adjoins the Isabella.

Near Victor the Strong property is having a large gallows-frame put up. The corner posts measure 16 inches by 60 feet. The boiler house is 70 by 100 feet. A 170-foot stack is in place; the single reel is ready to receive a flat cable 2000 feet in length. A 10-inch pump column will be built. The shaft will be sunk from the 800 to the 1000 foot level under Supt. McDonald, Foreman Atkinson and F. Lambert, master mechanic.

The Portland G. M. Co. is now credited with intention to make its latest purchase, the Thomas ranch on the line of the Cripple Creek railroad, a site for the new smelter, the first cost to be $500,000.

The Anchoria-Leland is crosscutting at a depth of 1000 feet.

IDAHO.

BLAINE COUNTY.

By the payment of $4639.47 by Arthur Brown of Salt Lake, Utah, he becomes sole owner of the Red Elephant and all the property of the late G. V. B. Co.

CASSIA COUNTY.

The Black Pine M. Co., 100,000 shares, par value 25 cents, has incorporated. The property consists of the Hatfield group of ten claims in Black Pine district.

IDAHO COUNTY.

The Little Giant property is being worked by its new owners, the Idaho L. G. M. Co. W. H. Hill is general manager, J. J. Bennett Supt. Ten stamps are dropping at the mine. The force is to be increased to thirty-five.

The Silver King is being worked by a Philadelphia company, employing ten men.

The Buffalo Hump Syndicate owns nearly all of a strip of ground, 3500 feet wide, beginning at the head of Lake creek and extending 4 miles down the stream. The syndicate controls the townsite and is doing most of the work. It employs fourteen teams and 220 men. Of the employes 130 are building roads, 30 are carpenters, 40 miners and 20 around the sawmill and at other work. Wages paid are $3 for ordinary, $4 for carpenters and $3.50 to $4 for miners. Board is furnished at $1 a day. A scarcity of men is claimed in all lines of work.

OWYHEE COUNTY.

The DeLamar M. Co.'s annual report for the year ending March 31, 1900, shows:

Amount realized from ore crushed	$466,126 00
Amount realized from shipping ore, mill residues and miscellaneous sources	22,174 00
Total receipts	$488,300 00
Totol working expenses, including mill tunnel cost	301,659 98
Net profit	$96,730 02

The tabulated results of nine years' working since the property was taken over by the company show: Number of tons treated, 345,914; ounces of gold produced, 191,897; ounces of silver, 2,646,743; value of shipping ore sold, $752,722; total receipts from the mines, $6,738,490; amount of dividends paid, $2,352,000; amount of undivided capital, $175,621. The amount paid out in mine expenses during the nine years, $3,847,827.50.

SHOSHONE COUNTY.

Spokane employment agencies say that miners are wanted in the Cœur d'Alenes.

WASHINGTON COUNTY.

F. J. French, manager Blue Jacket, Seven Devils, is shipping copper ore to Salt Lake.

Caswell Bros., on Thunder mountain, in a run of seventy-two hours, with hydraulic power, took out twenty-nine pounds of gold, avoirdupois weight, worth $13 an ounce. They worked an area of 75 feet square and a depth of 3 feet. The material is dug out and slacks, after which it is washed. Below a depth of 3 feet it is too hard to work by this method, but carries as much gold as from the surface to that depth. The extent of this auriferous porphyry is not known. Three tons were crushed in a mill at Warren and yielded $31.10; that amount was taken from the plates.

MONTANA.

MADISON COUNTY.

Near Virginia City the Kearsarge mine is being examined by Butte men.

At Alder Gulch men are working over the old placer tailings. Three steam dredgers are also at work.

The Easton, owned by H. Elling, has about 5000 tons of ore on the dump ready for shipment.

C. D. McLure has twelve patented claims at the head of Alder gulch.

The Bedford mine is being exploited by M. B. Davis.

TETON COUNTY.

A. D. Macdonald of the M. & M. M. Co. says of the copper properties on the ceded strip that Mgr. Essler, operating the property, will have the 100-ton mill running Sept. 1. The property is 50 miles from the Great Northern at Blackfoot station.

NEVADA.

ELKO COUNTY.

A new cyanide plant is to be built at the Murphy group of mines at Bull Run, north of Tuscarora. H. C. Missimer expects to have the crushers going in September. A. H. Smith is local manager of the mines, and has blocked out considerable ore.

ESMERALDA COUNTY.

V. S. Hauser of San Francisco is examining the tailings of the Mt. Diablo and Holmes Cos. with the view of cyaniding the same.

HUMBOLDT COUNTY.

Silver State: The mines of the Glasgow & Western Co. at Copper canyon, Copper basin and Chery creek have been closed down. The company's smelters and mines at Golconda having also been shut down a few days ago, everything indicates that the company has ceased operations in this State indefinitely.

LANDER COUNTY.

C. Gardanier, manager Nevada M. Co., at Galena, has samples from the 150-foot level showing crystalilzed lead and considerable chloride of silver.

LINCOLN COUNTY.

From Stateline the Tribune hears that the mill with which the ores of the McCune properties at Fay are to be cyanided is nearing completion. In the Horseshoe group all the men for whom elbow-room can be found are being employed. The suspension of work at the Homestake group has rendered Deer Lodge almost lifeless; the buildings have been nearly all torn down and rebuilt at Fay. At Stateline the new hoist will soon be placed on the Ophir. Sinking at the Johnny is resumed. Work has been resumed on the Jumbo tunnel, which is to be driven 1000 feet.

J. B. DeLamar will build a plant at DeLamar to treat the 400,000 tons of tailings at the DeLamar mine.

WASHOE COUNTY.

Fifty pounds of ore from the Reno M. Co.'s property, White hill, assayed $83 in gold and two ounces in silver. The Journal reports activity in the prospecting line around Steamboat and on Granite hill. Mgr. Hillhouse of the Reno M. & S. Co. expects his plant by Aug. 15.

NEW MEXICO.

TAOS COUNTY.

Judge A. Royal of Pueblo, Colo., of the Whale mine, near Tres Piedras, has assays in gold and six ounces silver. The Strawberry mine, adjoining the Whale, owned by a Wisconsin company, is milling ore running $8.65 gold per ton.

Six miles east of Bromide prospectors have located a large deposit of asbestos. Thirty miles south of Bromide large mica deposits are being worked by a Cleveland company who are employing forty men.

SIERRA COUNTY.

The Oohoo M. Co. has completed an ore crusher, capacity ten tons daily, operated in connection with a lead jig.

OREGON.

BAKER COUNTY.

The Gold Boy, Black Hawk, Eclipse, Oregon and Keystone-Bell mines are to be consolidated under the management of the Keystone-Bell Con. M. Co., Baker City. The Gold Boy is owned and worked by F. J. Conroy.

GRANT COUNTY.

Granite reports that the Richmond M. & M. Co., owning claims in the Geiser district, has, through E. D. LeClare, manager, bought the 10-stamp mill now on the Don Juan property to be removed to its own property.

The G. C. P. & D. Co. of Colorado Springs and Boston has an option on mines in the Malone district.

JOSEPHINE COUNTY.

At the Elder copper mine, near Waldo, the company is running two tunnels, the lower one of which is expected to tap the lode at a depth of 200 feet. They have six teams hauling ore to Grant's Pass and have sent four carloads to the Selby Smelting Works, Vallejo, Cal.

The Alexander & Bent placer mine on Rogue river, 25 miles below Grants Pass, containing 510 acres of land and extending 3½ miles along an ancient channel, is reported sold to Chicago men for $100,000. The A. & B. mine has been operated at a profit for years. It was described and illustrated at great length in the issue of April 21, 1900. Its water supply is taken out of the west fork of Galice creek, in a 7-mile ditch, and gives a pressure of 350 to 400 feet at the mine. The bank is 80 to 150 feet high, the gold being principally in a stratum of blue gravel at the bedrock, 6 to 12 feet deep. The mine is well equipped with pipe and giants, a sawmill furnishing the necessary flume lumber.

UNION COUNTY.

The Tallmadge placers at Sparta are being worked. There are two giants in operation and eighteen men employed.

SOUTH DAKOTA.

LAWRENCE COUNTY.

From west of Greenmont station gold ore is being shipped by the Portland M. Co. of Deadwood to Kansas City.

G. D. Waugh of the Portland M. Co., Deadwood, has "a new secret process" and is going to "revolutionize the whole mining interests of the Black Hills" therewith.

UTAH.

SALT LAKE COUNTY.

The Highland Boy at Bingham has shipped copper, gold and silver bullion to the refinery at Perth Amboy, New Jersey, since June 13, 1899, a total of about 700,000 pounds. Assuming that this has brought the company an average of 16 cents a pound, the Tribune figures the gross earning of the Highland Boy Co. during the past thirteen months to have reached a total of over $1,100,000, or an average of $90,000 per month. Jos. Dederich has the contract for the erection of the steel structure, this part of the enlargement alone requiring nearly 1,000,000 pounds of steel, the delivery of which is promised in September.

TOOELE COUNTY.

The Mercur and Golden Gate consolidated on the 21st under the laws of New Jersey; H. A. Cohen, president and general manager; J. Dern, vice-president; G. Dern, treasurer; W. H. Cunningham, secretary.

WASHINGTON.

OKANOGAN COUNTY.

In Loomis the Black Bear keeps five stamps going; the fifteen additional stamps now on the ground will be put in place. A wire tram from mine to mill is projected.

The Palmer Mountain Tunnel Co. is taking ore from vein No. 20½, showing free gold.

At Silver the American Flag mine is hauling ore to the Red Shirt mill to ascertain the kind of material best adapted to treat the ore. Manager Stewart says that as soon as this question is determined a mill will be put in.

SNOHOMISH COUNTY.

A construction train on the Everett & Monte Cristo Railroad is at Monte Cristo, taking in supplies and machinery to be used in repairing the concentrator. Shipments from Monte Cristo will begin about Aug. 15

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The Anderderson Lake or McGillvery Creek mining camp, on the northwest side of Anderson lake, 10 miles from its eastern end, in Lillooet district, is a promising quartz mining section. (See map, page 93.) Many claims have been located and much prospecting work done, principally by local men, who are trying to cover too much ground for the capital at their disposal. The Anderson Lake M. Co.'s property is opened by tunnels, the lower tunnel in over 300 feet. The ledge averages 10 feet wide. There are two upraises, one 100 feet, the other 150 feet, both in pay ore; 250 feet higher up the mountain is tunnel No. 2, and 250 feet higher tunnel No. 3. Fifty feet below the level of the lower or main tunnel is a ditch, furnishing water power for a 10-stamp mill. The rock is delivered from the cars in the lower tunnel into an ore bin, thence by the tramway in self-dumping cars onto the grizzly and to the rock crusher and ore bin at the mill, thence by automatic ore feeders to the mortars and out over 4x16-foot silvered copper amalgamation plates. There are no concentrators in yet. The building is large enough for twenty stamps. Ten stamps are now dropping; mortar blocks are set for ten more, and the power, rock crusher, etc., of sufficient capacity to run the additional stamps, so that the cost of doubling the capacity of the mill will not be great. Two and one-half tons per stamp are worked daily. The altitude of the mill is 3400 feet; lower tunnel of mine, 3850 feet—3100 feet above the lake. The mine is reached from the lake by a zigzag sled trail, 4½ miles long. All machinery and supplies have to be sledded or packed up this trail. The average temperature in the mill in daytime during June was 47° F., and much cooler at night. The temperature of the water used in the mill is 45° F. The company has engaged a superintendent from Butte, Montana. The lakes are about 1 mile wide and over 20 miles long each. The banks are mountains 5000 or 6000 feet high, almost vertical in places, here and there ribbed with dashing, foaming streams coming from the snow, looking like ribbons 1 foot wide, where they first appear high up on the mountain sides. There are quartz claims in the vertical cliffs along the lakes that can only be reached by boats. This is the Yosemite of the North.

Anderson Lake, July 10.

The Britannia copper property on Howe sound, operated by H. C. Walters, is bonded by the B. A. Corporation, which owns the Le Roi and War Eagle mines. The figure of purchase is placed at $1,500,000; first payment of $50,000 falls due August 17th, and on the 17th days of each month thereafter for six months $50,000 is to be paid. For the next succeeding three months the payments will be $100,000 each. At the expiration of twelve months the bond will be cancelled by the payment of the remaining $900,000. Until the 17th of August the B. A. Corporation has merely an option upon the property, the bond not being a working one. Upon the payment of the first $50,000 the sale will be practically completed. Meanwhile the engineers of the B. A. Corporation will examine the property.

H. W. C. Jackson of the Rossland board of trade says the mines of Rossland at the present time are giving employment to 1200 men (eight-hour shifts) at an average wage of nearly $100 per month, and the shipments of ore are averaging over 4500 tons per week, of an average value of $16.50 per ton, at an average profit, clear of all expenses, including development, of $8.50 per ton. By the first of December he estimates that about 2500 men will be employed in the mines of Rossland and the average shipment 14,000 tons per week. The present population of Rossland is about 8000.

NEW ZEALAND.

A gold dredging boom is reported. Many claims on the West Coast have been floated; the yield of 1187 ounces for a week reported by one dredger company will give further impetus to speculation.

SOUTH AFRICA.

There were 12,314 white mining employes in the Transvaal in 1898. The average salary paid amounted to £321 11s, or £26 10s a month. The average includes the higher salaries paid. A report by the State mining engineer for 1898 gives the following averages as the monthly payments in that year for the various classes specified:

	Average Monthly Salary.		
	£	s	d
General managers.......	96	7	0
Mine "	41	18	0
Battery "	41	16	0
Mechanical engineers....	43	3	0
Surveyors (mine)........	31	0	0
Draughtsmen...........	28	2	0
Electricians.............	26	9	0
Secretaries..............	36	3	0
Mine clerks.............	22	3	0
Miners and trammers...	22	13	0
Foremen................	30	9	0
Pitmen..................	19	5	0
Engine drivers..........	29	6	0
Fitters..................	26	3	0
Assayers................	28	9	0
Amalgamators..........	23	14	0
Cyanide men............	24	7	0

It is thought that by Jan. 1, 1901, work will be resumed. This is a sanguine view. There will be less difficulty in securing white labor than in getting native black labor, the war having demoralized all existing arrangements.

SPAIN.

The Spanish Council has approved the contract with the Rothschilds for the sale of the product of the Almaden quicksilver mines on commission for ten years—1.25% on the sale price above £8 sterling per flask, instead of 2% on the sale price above £6 sterling.

THE KLONDIKE.

The steamship Amur, from the Klondike, brought nearly $1,000,000 in gold dust and ninety passengers, some of whom estimate the year's output of the Klondike at $25,000,000. The claims are now being worked summer and winter. There is still some grumbling over the 10% royalty, which the miners say makes it impossible to work some of the richest claims at a profit.

Obituary.

H. G. BLASDEL, the first Governor of the State of Nevada, died at his residence in Oakland, Cal., on the 26th inst., in the 75th year of his age. Deceased was a pioneer on this coast, a man of unusual ability, of herculean stature and great vitality. He was known and respected by many who admired him for his sterling qualities. He was not great, but good; not fast, but sure; not brilliant, but solid. He was a good citizen, a faithful officer, an honest trustee and a true friend, whether in the shadow of struggle or the sunshine of victory.

Personal.

J. P. EVANS of the Colorado Iron Works is in Arizona.

P. A. MCKENZIE succeeds R. G. Legg as Supt. Dexter G. M. Co., Tuscarora, Nevada.

W. B. SHORT is the new superintendent of the smelter for the Dyer Co. near Vernal, Utah.

VICTOR M. CLEMENT has established his permanent headquarters at Salt Lake City, Utah.

W. S. KEYES has returned to San Francisco from a professional visit to British Columbia and Utah.

R. G. DAVIDSON is manager Buena Vista mine, Sonora, Mexico, operated by an English company.

CALIFORNIA STATE MINERALOGIST COOPER has returned to San Francisco from southern California.

A. C. STOCK has been appointed manager of the Rhodes Marsh Salt & Borax Works, Hawthorne, Nevada.

E. M. BIND of San Francisco has gone to Durango, Mexico, where he reports having secured some good properties.

H. P. WATERMAN of the Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., recently returned from California.

THEO. F. VAN WAGENEN has returned to Denver, Colo., from an extended itinerary through Arizona and southern California.

GEO. H. KISLINGBURY of Berkeley, Cal., goes to Mexico to examine mining property. He is credited with having been tendered a position near Paris, France, by J. B. DeLamar.

D. E. BIGELOW has returned to San Francisco from Weaver, Arizona, where he put in a 40-stamp mill built by the Union Iron Works for the Octave M. Co. The entire establishment cost $125,000.

N. C. RAY of Coulterville, Cal., is talked of there for the legislature. Though unacquainted with his politics, which is immaterial, the fact that he is a prominent mining engineer makes this paper suggest that members of that profession in the California legislature would be good for the mining industry, and, possibly, good for the legislature.

Commercial Paragraphs.

THE Crown G. M. Co.'s new process for sizing and concentrating dry ores can be seen at the works, No. 23 Stevenson street, San Francisco. This is a new and scientific system for handling dry and refractory ores that deserves the careful attention of practical mining men. An inspection is invited.

THE plant of the Colorado Iron Works at Denver, Colo., was considerably damaged by fire on the 15th inst.; but, with the exception of the steam hammer and forging department, work was not seriously interrupted. President Nesmith states that the steam hammer and forging equipment will be thoroughly replaced by August and that a steel and brick fireproof building will at once replace the wooden building destroyed.

THE Gillette-Herzog Mfg. Co., now a part of the American Bridge Co. consolidation, have the contract to furnish and erect the structural steel for the smelter of the Santa Fe G. & C. Co. at San Pedro, N. M., which will include a power-house and blower-house. The same company also have contracts for similar work for the Rocky Mountain smelter at Florence, Colo. Their Denver representative also reports the erection of a steel gallows-frame for the Copper Queen Co. at Bisbee, Ariz.

GEO. W. PENNINGTON & SONS, manufacturers of the Pennington steel shoes and dies, are now in their new works at the corner of Montgomery and Chestnut Sts., San Francisco, Cal. They have put in two of the largest steam hammers west of the Rocky mountains and several of smaller size. This more than doubles their former capacity and also enables them to handle a larger class of forgings than heretofore. The steel shoes and dies made by this firm are of high quality and in extensive use. The old works at 218–220 Folsom St. are retained as a branch of the new works.

THE Thornton N. Motley Co. of 43 St. John St., New York City, licensees for eastern United States and foreign countries for the manufacture and sale of the Jackson hand-power rock drill, report orders booked week before last for drills from France, Nova Scotia, Mexico and two South American countries. Recent foreign sales include the following: Bogota, Colombia, two drills; Santiago, Cuba, one drill; Brussels, Belgium, one drill; Paris, France, one drill; Progresso, Mexico, one drill; Perth, West Australia, one drill; Tegucigalpa, Honduras, one drill. One drill was also shipped to each of the following points: Thomas, W. Va.; Buffalo, N. Y.; Dayton, Tenn.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING JULY 17, 1900.

653,838.—EDUCATIONAL DEVICE—L. G. Belond, Stockton, Cal.

653,653.—REIN HOLDER—M. Bohnert, San Diego, Cal.

653,839.—IRONING BOARD—Wm. O. Bowman, Fairfield, Cal.

853,842.—SYRINGE—A. J. Brown, Oakland, Cal.

653,859.—PACKING—M. Bulkley, Oakland, Cal.

653,860.—PUPPET VALVE—M. Bulkley, Oakland, Cal.

653,861.—SHIP'S ANCHOR—J. Callow, New Kamilchi, Wash.

653,661.—ROPE FASTENING—C. A. Conger, Oakland, Cal.

653,800.—COLLAR STIFFENER—E. R. Gould, Spokane, Wash.

653,772.—TACK DRIVER—G. W. Hobbs, Los Angeles, Cal.

653,817.—HARVESTER LOCK—M. G. Morgan, Dixon, Cal.

654,078.—WINDOW SHADE HANGER—H. H. Stratton, S. F.

653,833.—SEEDER—A. V. Wilbur, Stockton, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TRAVELING HARVESTER.—No. 653,465. July 10, 1900. Daniel Best, San Leandro, Cal. The object of this invention is to provide improvements in that class of machines known as traveling harvesters, in which the grain is cut, delivered to the thrashing cylinder, thrashed, separated and cleaned in continuous operations. The ininvention consists in improved means for connecting the header portion with the thrashing machine frame, and in means for transmitting power from the driving parts of a thrashing machine portion to drive the sickle carrying belt or draper reel and various parts of the header mechanism. The connection between the header frame and the thrashing machine frame is effected by means of hooks upon one part and pins upon the adjacent part with which they engage and means for retaining them normally in position, but by which they can be easily released to disengage and separate the parts. In order to transmit power from the thrashing machine portion to the header to drive the sickle reel belts, etc., I employ a flexible belt or chain transmission with suitable guide and direction pulleys or sprockets so that whatever the change is in position between the two parts of the machine, the power will always be properly transmitted from one part to the other.

SAFETY LOCK FOR HARVESTERS.—No. 653,817. July 17, 1900. M. G. Morgan, Dixon, Cal. The object of this invention is to render harvesters and like large traveling machinery safe against accidents by reason of runaways. The invention consists of shoes with devices by which they are normally suspended in front of the main bearing wheels. A lever or like mechanism is connected with the suspending devices, so that if the team attempts to run away or the machine becomes unmanageable, these shoes may be dropped upon the ground in front of the wheels which run up on the shoes, so that the whole machine is supported upon the shoes and the wheels cannot revolve. In order to hold the shoes in place beneath the wheels they are connected with some part of the frame by stout chains which are only long enough to allow the wheels to roll up on the shoes where the latter are held in place.

Latest Market Reports.

SAN FRANCISCO, July 26, 1900.

SILVER—Per oz., Troy: London, 27¾d (standard ounce, 925 fine); New York, bar silver, 60¼c (1000 fine); San Francisco, 60¼c; Mexican dollars, 49c.

The Secretary of the Treasury has issued an order authorizing the mint at San Francisco and the assay office at Seattle to pay all depositors of gold bullion who desire it by drafts on Chicago or New York. It is thought that $20,000,000 will be so paid during the remainder of the year.

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.35; carload lots, 16.12½; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.00; Salt Lake City, 3.87½; St. Louis, $3.95; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 12s 6d = 3.82½c per ℔.

The prices of the American Smelting & Refining Co., for shipment before August 1, seller's option, 50-ton lots, are:

Delivered.	Desilverized.	Corroding.
St. Louis	$3 95	$4 05
Chicago	3 95	4 05
Cincinnati	4 00	4 10
Pittsburg........	4 05	4 15
Philadelphia.....	4 05	4 15
New York........	4 00	4 15
Boston	4 07½	4 17½

On carload lots 5c. per 100 ℔s. higher.

SPELTER. — New York, $4.30; St. Louis, $4.20; San Francisco, ton lots, 5c; 100-lb lots, 5¼c.

ANTIMONY. — New York, 10c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, pig, No. 2, foundry, $16.00; gray forge, $15.00; San Francisco, bar, per lb., 3c. in small quantities.

STEEL. — Billets, Pittsburg, $21.50; bars, 1.25; San Francisco, bar, 8c to 15c per lb.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $51.00 ꝑ flask of 76½ ℔s.; Export, $47.

MAGNESIUM.—New York, $3.00 ꝑ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21½c; San Francisco, Plumbers', 100-℔. lots, 18¼c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $32.75; San Francisco, ton lots, 34c; 1000 ℔s., 32c; 500 ℔s., 35c; less, 36c; bar tin, ꝑ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ꝑ ℔.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.— San Francisco, crude, $17 ꝑ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ꝑ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ꝑ ℔.

TUNGSTEN.—New York, ꝑ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $88.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ꝑ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ꝑ ℔.; soda ash, $1.60 ꝑ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ꝑ ℔.; blue vitriol, 5½@6c ꝑ ℔.; borax, concentrated, 7@8c ꝑ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ꝑ ℔.; caustic soda, in drums, 3@4c ꝑ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ꝑ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 79c; cs., 84c; raw, bbl., 77c; cs., 82c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

Catalogues Received.

THE S. H. Supply Co., Denver, Colo., have issued a carefully prepared catalogue (No. 27) giving cuts, descriptions and prices of machines, tools and supplies which they have for sale, and which pertain mainly to mine and mill equipment.

THE 1900 "catalog" of the Keystone Driller Co., received this week, is in reality a treatise on drilling, in plain language, well illustrated, and so put before the reader as to thoroughly convince him that the people who put out that "catalog" know what they are talking about, and, probably, know something about how a good drilling machine should be made. In several ways this "catalog" is the best trade treatise received at this office this month. In some regards it is a model. Anyone who has any notion of drilling a hole in the ground for any purpose would do well to send for a copy to the Keystone Driller Co., Beaver Falls, Pa.

Recently Declared Mining Dividends.

SITUATIONS WANTED.

WANTED.—A SITUATION BY A COMPETENT Assayer, Surveyor, Draughtsman and Bookkeeper, with good references. Address L. R., this office.

ASSAYER – CHEMIST desires appointment. Four years chief assayer in present situation—one of the largest gold-silver mines. Highest testimonials. Address Assayer, Mining and Scientific Press.

Experienced Assayer, Cyanide Operator, Surveyor, and generally experienced around mine, is open for engagement. Also A1 Bookkeeper. Address S. W. T., this office.

Chemist and Metallurgist, engaged exclusively in cyanide since 1891, is open to engagement. Address H. B., care of Mining and Scientific Press.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

Engineer and Metallurgist, graduate Freiberg, with years of experience in mining, smelting, exploration and ore treatment methods, with most exceptional references, seeks position. No objection to go anywhere. Speaks five languages. Fearless, energetic and temperate. Mexico, Alaska, or South America. Address MINERO, this office.

An Experienced, Aggressive Mining Engineer and Metallurgist, technical graduate, eighteen years' practical experience in the United States and Canada as manager and consulting engineer of mines and mills, is open to engagement as manager, superintendent or chemist. Thoroughly understands economic mining and reduction of gold and silver ores. Not afraid of a hard proposition. Can leave present position with month's notice. Correspondence solicited and references exchanged. Address KARL NEITZEL, Camp McKinney, B. C.

CYANIDING.

Have had charge of five mills and worked in every part of process from shoveling to laboratory work. Test ores and outline process for treating them. For three years treated SLIMES successfully. Wish a position after July 10. Have studied to excel. References as to character and ability.

Address K. C. N., Boise, Idaho, Box 3.

WANTED.

WANTED.—A CHEMIST AND ASSAYER FULLY conversant with the latest and most economical methods of cyaniding; also an Assistant Assayer and Chemist. State salary expected and forward testimonials. Address "Extraction," care of Mining and Scientific Press.

WANTED--A Developed Low Grade Free Milling Proposition.

Address, with full particulars and terms, B. W., Box 82, Buena Vista, Colorado.

TO MINING EXPERTS.

WANTED.—A proposition containing magnetic pyrites (Fe_7 S_8 to Fe_{11} to S_{12}).

Address THOS. L. NEAL, Attorney, Lankershim Block, Los Angeles, Cal.

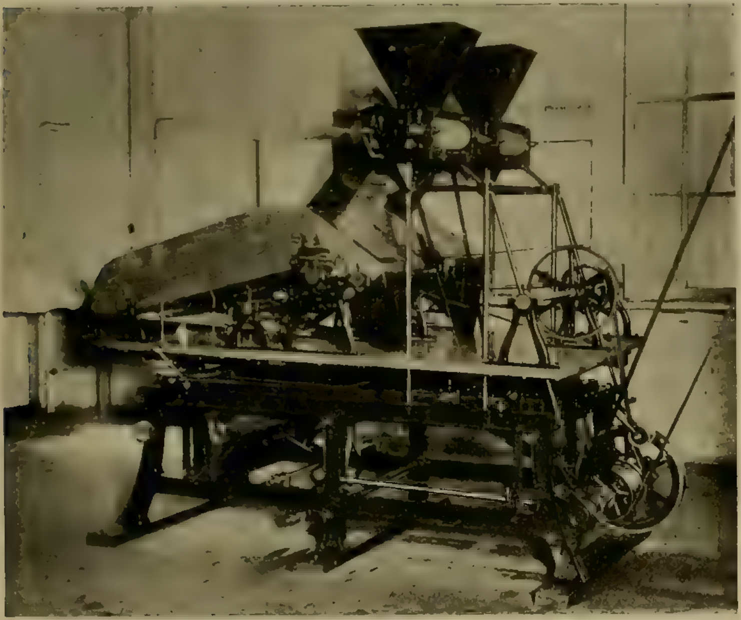
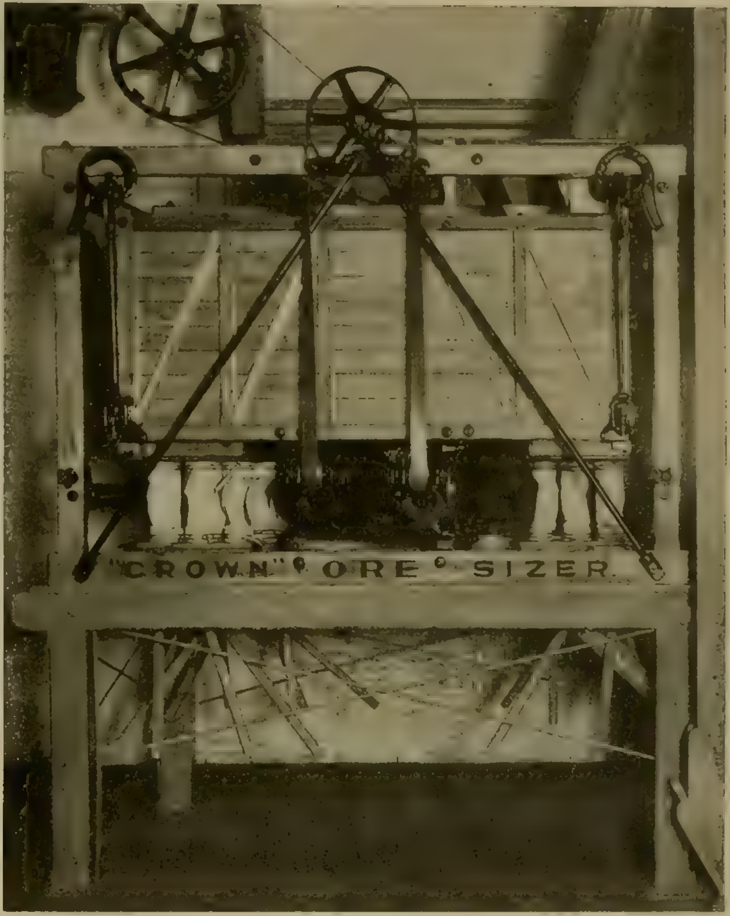
CROWN GOLD MILLING CO.

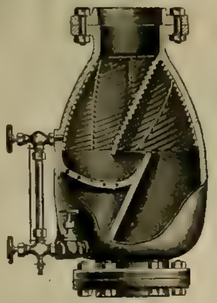
Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

☞ The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.





Works, 23 Stevenson St. Office, 230 Post St. SAN FRANCISCO, CAL.



Ever Know an Engine Has Lungs?

The cylinder of an engine corresponds with lung action and in some ways is afflicted with lung trouble. For instance, too much moisture in the steam cylinder will cause more trouble than a damp atmosphere to a consumptive.

Vertical. Sizes 1½ to 12 in. AUSTIN Separators **Horizontal. Sizes 1½ to 12 in.**

Are the proper medicine. They eliminate all moisture and ensure the greatest efficiency to the engine. Shipped on 30 days' trial to responsible parties anywhere in the United States and freight paid both ways if not satisfactory.

SEND FOR OUR NEW CATALOGUE.

SMOOTH-ON TRADE MARK CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

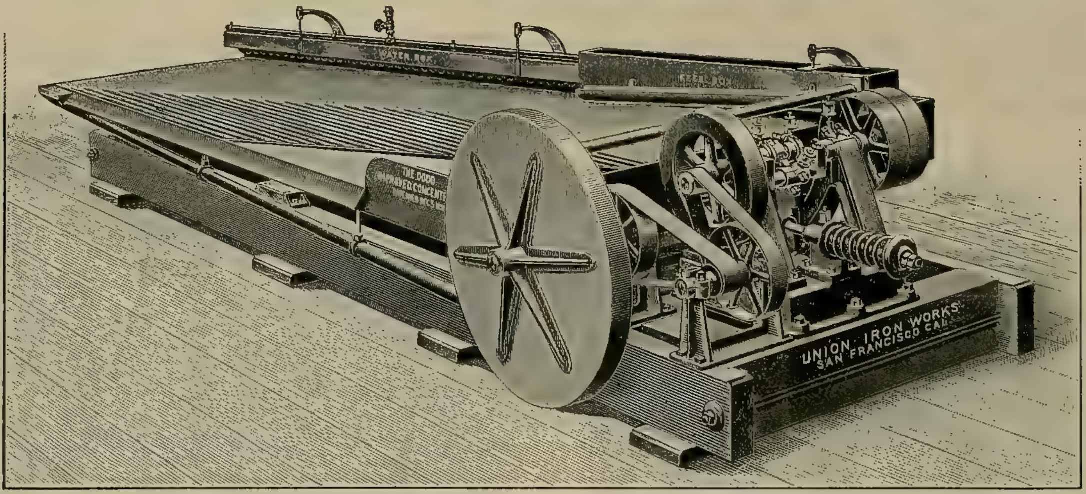
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

NO TROUBLE TO OPERATE--A BOY COULD RUN IT.

TO ASSAYERS:

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

OF EVERY DESCRIPTION.
All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of

Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

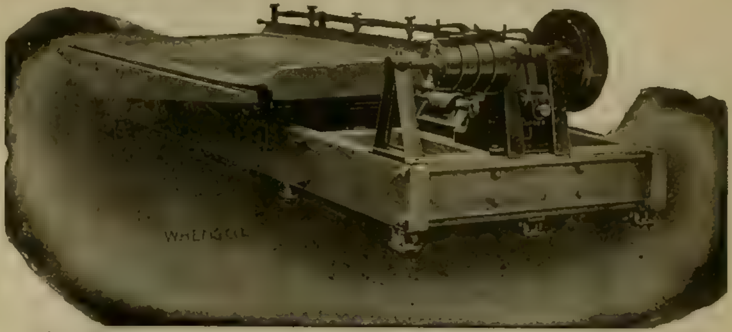
THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post**, July 15th, 1900

* * * "Now about concentrating tables. Here's a fellow who says there's nothing equal to the Wilfley, and I am trying to convince him that old man Woodbury over in California makes the finest table in the world." "No, sir," said his comrade, "you're way off. I've tried the CAMMETT too thoroughly to believe there's anything made to equal it."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,
30th and Blake Streets, - - - - DENVER, COLORADO.

CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

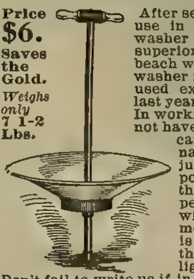
THE LITTLE ALASKA GOLD WASHER.
Price $6.
Saves the Gold.
Weighs only 7 1-2 Lbs.



After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

A MODERN COPPER SMELTER.

THE COLORADO IRON WORKS CO.

ESTABLISHED 1860. DENVER, COLO.

—MANUFACTURERS OF—

Smelting Furnaces and Equipments

: : : FOR THE TREATMENT OF : : :

Gold, Silver, Lead and Copper Ores.

We build furnaces to drawings and specifications, and furnish drawings and full instructions for erecting.

We erect all furnaces at our works and carefully mark every piece before shipping. By this means, trouble in erecting at the smelting plant is entirely avoided.

We contract to build and equip smelting plants complete, of any required tonnage capacity above forty tons per day, at any desired location and put them into successful operation under guarantee. We contract to smelt a thousand tons of ore, more or less, before turning the plant over as completed under the guarantee

We have in the past built more Blast Furnaces for smelting the ores of the valuable and the precious metals—gold, silver, lead and copper—than any other manufacturing concern on the American continent, and in the past year of 1899 we built more such furnaces than all others combined.

Notice of Application for Dissolution.

In the Superior Court in and for the City and County of San Francisco, State of California.

In the Matter of the Voluntary Dissolution of the South Paloma Gold Mining Company, Limited. (a corporation.)

Notice is hereby given that the South Paloma Gold Mining Company, Limited, a corporation created and existing under the laws of the State of California, has presented to the Superior Court of the City and County of San Francisco, State of California, a petition praying for a judgment and decree declaring the said corporation dissolved according to law; and that said application will be heard on TUESDAY, the 31st day of July, 1900, at 10 o'clock of said day, or as soon thereafter as counsel can be heard, at the court room of said Superior Court, Department No. 3 thereof, at the New City Hall, in the city and county aforesaid.

Witness my hand and the seal of said Court the 25th day of June, A. D. 1900.

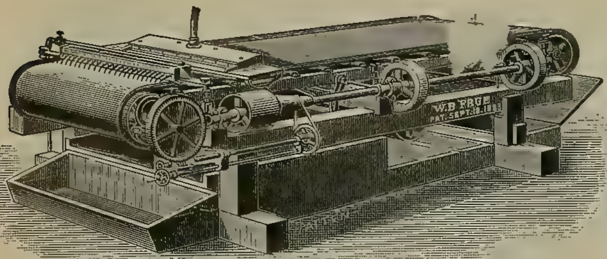
FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

J. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.,
132 MARKET STREET, (Successor to Adams & Carter.) SAN FRANCISCO, CAL.

GEO. E. DOW PUMPING ENGINE CO.

(Successors to DOW STEAM PUMP WORKS.)

108-120 BEALE ST., - - SAN FRANCISCO, CAL.

MANUFACTURERS OF

DOW PUMPS

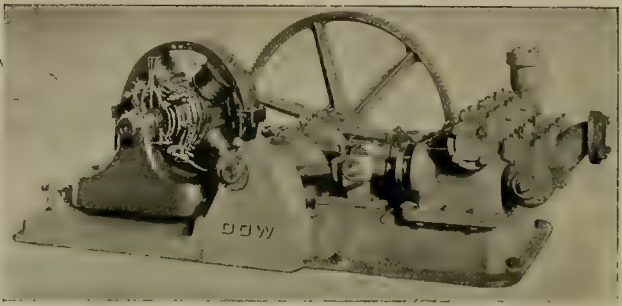
FOR MINING PURPOSES,

Operated by STEAM, AIR, ELECTRIC or WATER POWER.

VERTICAL SINKING PUMPS, BUCKET OR DOUBLE PLUNGER PATTERN.

DEEP MINE STATION PUMPS.

PUMPING MACHINERY FOR EVERY POSSIBLE DUTY.



HOR. TRIPLEX MINE STATION PUMP WITH ELECTRIC MOTOR.

THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

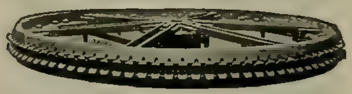
Cableways, Transmission by Wire Ropes,
Incline Planes, Cable Grips,
Logging by Cables, Automatic Loaders,

PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

Improved GRIP PULLEY.

Patents Nos. 483,442; 610,353.



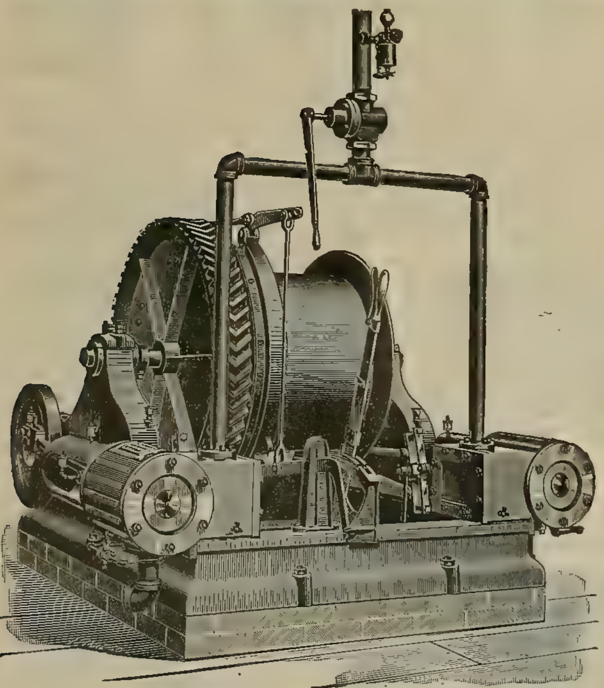
EFFECTIVE, SIMPLE, AUTOMATIC.

Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet.

Correspondence Solicited.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.



FIXED DRUM ENGINE.

PARKE & LACY CO.,

21 and 23 FREMONT STREET, SAN FRANCISCO, CAL.

Hoisting and Pumping Machinery

...FOR...

MINE PROSPECTING AND DEVELOPMENT.

SOLE AGENT FOR THE

Ingersoll-Sergeant Rock Drills and Air Compressors.

LICENSEE FOR THE MANUFACTURE AND SALE OF THE

Ropp Straight Line Furnace for Roasting, Chlorinating and Desulphurizing Ores.

Huntington Centrifugal Roller Quartz Mill,

Simmons Ball-Bearing Hydraulic Giants, Paul Ball Mill.

WE CARRY IN STOCK

Horizontal, Vertical and Portable Engines and Boilers,
Rock Breakers, Cornish Rolls, Pulverizers, Concentrators, Ore Feeders,
Hoisting Engines, Horse Power Hoisting Whims, Water Wheels, Steam Pumps, Ore Cars, Wire Rope, Ore Buckets, Water Buckets, Skips,
Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR

Manganese Steel Shoes and Dies. Bullock Diamond Drills.

KNOWLES PUMPS AND PULSOMETER PUMPS.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrating and Stamp Mills.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

For Eastern Readers.

With the exception of the Comstock shares there is little public buying or selling of mining stock in California. Ordinarily, men work the mines instead of the street. Inquiries received from Eastern investors indicate that considerable quiet traffic is going on in mining stock in sundry localities east of the Missouri river. So much has been said herein on this subject that nothing can be added that would be new, but there is a point raised in a recent inquiry that deserves notice. The question asked is as to the relative value of investment in mining stock as compared with stock in a manufacturing or similar industrial enterprise.

Cleaning Up in Mill, Empire Mine, Grass Valley, Nevada County, Cal.—(See page 120.)

Ordinarily, the difference is in the fact that, as the term is generally used, mining stock does not "earn" money as stock investment in other industrial enterprises. A mining investment differs from any other in having its profits derived from what is really its capital—the ore in the mine. Dividend-paying shares in a railroad, a factory, a bank, a mercantile concern or any other similar form of corporate business draw their profits from the proceeds or result of the operations of the business, and, without reference to the capital itself, which is assumed to remain intact, and, with due allowance for contingencies and deterioration, can so continue on indefinitely. In a mine every dollar of profit represents so much taken from the mine itself, which practically represents the capital of the concern. The earning power of an industrial enterprise may be perpetual. When the mine gives out, its capital is exhausted; and as it is only from this source that dividends can be paid, they cease with the working out of the mine.

"Ore Train," Empire Mine, Grass Valley, Nevada County, Cal.—(See page 120.)

There are many mines that may be considered as good permanent dividend-paying investments as can be found, and furnishing far better and higher dividends on the amount invested than could be secured by the placing of a similar sum in any other way; but the stock in those mines is not ordinarily for sale, and, when a block is sold, there is considerable publicity over it.

Little attention is to be paid to prospectuses in daily papers, or to specious statements of what is "going" to be done. There is generally likelihood of making a good mine by honest and intelligent development of a good prospect, and some of the best dividend-paying mines in the country have been developed by the co-operative purchase of mining stock. Under certain circumstances nothing is a better or surer investment; but the Eastern investor or inquirer, for whose benefit this is written, should distinguish between business investment and heedless speculation.

Oil Fuel for Locomotives.

Petroleum possesses superior advantages for locomotive fuel compared with coal on the Pacific coast. For some time the engines on the Southern California R. R. have used oil fuel, and now the C. P. Ry. engines between San Francisco and Ogden, Utah, are to be fitted for oil burning. Locality and cost of the two fuels determine economic value. Some of the railroads east of the Missouri river get bituminous coal for $1 per ton. The S. P. Co. pays about $5 per ton and the S. C. R. R. has paid $8. Some extensive railway experiments indicate that one pound of oil used as fuel is equivalent to two pounds of coal; and that with oil costing 3½ cents per gallon, it was equal in cost to coal at $4 per ton. According to such test, oil at that price is the cheaper fuel where coal costs more than $4 per ton and the dearer where it costs less. On some roads a fuel is used consisting of oil gas tar, coal gas tar, creosote oils and petroleum residues, the engines being fitted to burn either the above mixture or coal as desired. For such oil use each injector has two steam supplies—one to an internal annular jet, which injects the oil fuel in the form of finely atomized spray through the nozzle, and at the same time exhausts air through a central tube, either from the main automatic vacuum brake pipe or through a series of air heating tubes placed round the interior of the smoke-box. The second steam supply is delivered to a ring-blower arranged at the front of each injector, from which it escapes in small jets, inducing in regular quantity additional atmospheric air to insure perfect combustion, and at the same time atomizing the stream of liquid fuel issuing from the nozzle. These jets also distribute the gases over all parts of the firebox, and so equalize the flame, without the aid of firebrick erections, in former systems, that were preventive of alternate use of a coal fire. Taking a month's average run of 3000 miles, the fuel consumption of an engine so fitted was 11.5 pounds liquid fuel and 11.8 pounds coal per mile; with coal used exclusively, 35.4 pounds per mile.

The Santa Fe Co. is now arranging to use liquid fuel on its locomotives between San Francisco and the Arizona line.

Several California manufacturing establishments are also fitting their stationary engines for oil fuel. Coal has been costing San Francisco steam users about $6 per ton, and it is figured that with oil delivered at $1.43 per barrel considerable saving will be effected.

More About Mining Experts.

Some remarks in last week's issue on mining experts and expert evidence appear to deserve elaboration. What was said last week is so. The suggestion that the court have an expert of its own is considered in line with present requirements.

The custom or practice of admitting expert testimony is not so ancient as to be endowed with the traditionary homage accorded to precedent, and even if it were, we, here, in the west half of America, who believe that the law was made for man and not man for the law, could abolish or change the present system to the more equitable one of having the court and not the lawyers or litigants furnish expert testimony.

Everywhere are being tried cases between mining companies, sometimes involving millions, before courts where may be called in two, ofttimes antagonistic, sets of expert statements by mining engineers and experts and some who can lay no just claim to either title. Some of these experts seem to go on the stand feeling that they have been retained by their employers and that, like other men, their first duty is to earn their fee and give value received for the retainer. That frame of mind, however satisfactory to the employer, is not ordinarily conducive to a fair or impartial statement of the entire truth, no matter if, as last week suggested, the expert does not desire to confuse nor confound the facts and wants to state the truth as it appears to him.

On the part of the lawyers their efforts seem, sometimes, to be to try to prove that the expert retained by their side knows all about it, and the expert retained by the other side knows nothing concerning the matter, each side expecting to grill the other in cross-examination, and if they can confuse or mislead the judge or the jury so much the better—or the worse. Where the expert does not want to state the truth or is incapacitated by reason of nature, education or knowledge of doing so, it makes it worse still, as in that celebrated mining case told of in Denver where the expert had prepared a map of the underground workings of the property in dispute, and, having submitted it to the attorneys on the side for which he was employed, was told by them that its use would tend to destroy their case, and gave it as their opinion that his own map would help to establish the theories and claims of the other side. "That can easily be fixed," was his alleged answer, and fixed it was, as the story goes. He sat up all night, made a new map locating the vein and its direction differently from what it really was, and next day when he went into court swore to its correctness. This is unaccompanied by affidavit and probably is an exaggeration.

Such stories may be circulated against any class, no matter how honored or honorable; but anyone who has had anything to do with mine litigation can tell how near true it may be in some cases coming under his personal observation or experience. Indeed, it is the case that some mining engineers decline to appear as experts, not desiring to have their motives impugned or their honesty decried. The expert is not to blame; he goes on the stand and frequently is not given a free head, but has to answer nothing but cleverly concocted questions, and, as in all such cases, the environment goes largely toward determining what is and what is not admitted as testimony. It is not the expert but the system which is at fault.

The object of all courts and legal procedure is to obtain justice, and justice demands that the whole truth be honestly brought out. It is in order that where mining litigation comes before the court, that it be the province and the duty of the judge to determine upon evidence and inquiry whether a mining expert offering to testify is so fitted, and, if he be, that he be not considered or selected as the witness of the one party or the other, but go as an arbitrator or commissioner; a technical adviser of the court itself; a guide for the court and the jury in forming correct judgment in the case. What he might be called would be a secondary matter; if desired he could continue to be designated a witness, but the suggestion that that class of information be selected by the court itself will probably meet the approval of many mining experts everywhere who have felt at times that they were placed in a false position and who, while as men of honor desired to place the real facts of the case before the judge or the jury, found themselves stultified or restricted by the surrounding circumstances. For compensation for his services the mining expert could be paid by the court out of the public treasury or have his fee charged to the expense of the trial, as part of the costs of the case, to be met by both parties as common expense. This may seem radical suggestion, but it is our belief that what is here proposed is what will ultimately come to pass, to the advancement of justice, decrease in costs of mining litigation, at least equal recompense to mining experts as under the present system of fees, and increased satisfaction to any mine owners or workers who find themselves required to resort to litigation.

Holding a Mining Claim.

The locator of a mining claim who fails to do the required annual assessment, but who resumes work upon the claim before any other party has made a location on the same claim, has been given by the courts a quasi title in cases where another party had located upon the claim subsequent to the resumption of work by the original locator. The most recent decision on that question that we call to mind was by Judge Hallett of Colorado. He decided a case involving that principle in favor of the original locator. He held that the second locator acquired no rights by filing on the claim after the first claimant had recommenced work; that any rights a "jumper" might have would begin only with the first stroke of his pick, and could not be based upon any alleged neglect or lapse of the previous locator, provided that such previous locator had resumed work before the jumper had made his location. Judge Hallett's decision has not been reversed by any higher court. His decision in effect is that the annual assessment work required by law is not for the purpose of keeping alive the title to the claim, but to prevent such title from collapse; that it made no difference whether the annual work in question was done or not, so long as the first locator had asserted his rights in the following year before any attempt had been made to relocate the claim. That is, if a man did not do the required amount of work up to a certain time his claim lapsed; but if, however, he began work on the claim during the following year, before another locator had intervened, he re-established his rights, his location then being practically an original location, and no other locator could claim title by relating back any lapse of which the first locator had not taken advantage in time. The action of the original locator in such cases is risky and he is liable to have trouble. If he fail to perform the necessary assessment work his claim is jumpable under the law, and it were better to take no such chances as those taken in the case in question. The matter is here referred to in answer to sundry inquiries on the subject.

Increased Gold Production.

An official report from the Bureau of Statistics, Washington, D. C., shows that the increase in gold production in this country and elsewhere during the past few years makes the total gold product of the half century now ending $6,665,631,000. This is more than twice as much as during the entire 350 years preceding the half century now closing. The gold production of the world from 1492 to 1850 amounted to $3,129,720,000, that of the period 1851–1899 was $6,665,631,000.

The following table, compiled from the estimates of Adolph Soetbeer and the Director of the U. S. Mint, shows the gold production of the world by half century periods from the year 1500 down to the present time:

Period.	Amount produced.
1501–1550	$225,580,000
1551–1600	245,580,000
1601–1650	281,840,000
1651–1700	324,440,000
1701–1750	587,580,000
1751–1800	677,240,000
1801–1850	787,460,000
1851–1899	6,665,631,000

The additions to the world's supply of gold during the past four years have been as follows:

Date.	Gold production in United States.	Total gold production in the world.
1896	$53,088,000	$202,251,000
1897	57,363,000	238,812,000
1898	64,463,000	287,428,000
1899	72,500,000	315,000,000
Total	$247,414,000	$1,043,491,000

Concentrates.

UNTIL a U. S. patent is obtained the owner of a mining claim is never certain of his title.

THE largest stamp mill in Canada is probably the one at the Ymir mine, Nelson district, B. C., eighty stamps now crushing $10 ore.

A DELINQUENT co-owner of a mining claim has 180 days from the beginning of the publication of notice of delinquency in which to pay up.

IT is not unusual to work a continuous telegraphic circuit of 6000 miles for hours at a time by the Associated Press in sending daily press report.

SILVER, in the form of coin, is at a premium at Cape Nome, Alaska, by reason of its scarcity, a $20 gold piece being exchangeable for only $18 in silver.

THE California Debris Commission since its organization has received 481 applications for mining permits, of which 371 have been granted: of these 145 have been revoked.

MINING beach sands has had many columns of description herein. An illustrated article in the issue of May 15, 1897, is among such valuable information furnished in former years.

AN aperture 12 inches by 12¾ inches wide, through a 1½-inch plank, with a head 6 inches above the top of the opening, will discharge 200 miner's inches per minute, or about 300 cubic feet.

TALC is composed of 63.5% silica, 31.7% magnesia, 4.8% water. It is a greasy mineral with a pearly luster, color white to apple green. An inferior quality of coarser structure is called soapstone.

THE Congress mine, Arizona, was originally worked for the copper. Depth made a gold mine of it. The Congress is now working on the 2700-foot level and the ore taken from the bottom of the incline shaft is reported rich as ever.

SO FAR as known, the biggest mine blast in California was fired in 1878, in the Dardanelles mine, Placer county, moving 500,000 cubic yards gravel; nineteen tons Judson powder were used—equivalent to about 75,000 pounds black powder.

WHEN petroleum is talked of, a "barrel" is understood to mean 42 gallons. A wine barrel contains 31½ gallons and is the standard used when capacity of cisterns or tanks is given in barrels. Petroleum will weigh 6½ pounds per gallon.

SOUTH DAKOTA law requires that every corporation doing business in that State must make an annual public statement of its affairs through an advertisement in some newspaper published in that State; but no attention is paid to such singular statute.

THE Wetherill magnetic separator is considered a valuable appliance. It is in successful operation in the works of the New Jersey Zinc Co. at Franklin, N. J., and is being given experimental operation at Denver, Colo., in the separation of black sand.

IN law a "known" mine is deemed synonymous with an operated mine. The existence of a mine is not "known" until ore has been extracted or shown to exist in sufficient quantity and value to warrant extraction within the boundaries of the claim located.

IN March, 1881, the California Legislature passed a bill providing for a State hospital and asylum for miners, and the Governor signed it. The intent was to establish a hospital for disabled miners; but no subsequent Legislature has made any appropriation therefor.

RESULTS alone determine the value of a mine. A property producing $500,000 per year and paying $50,000 annual dividends, with an annual investment of $25,000 in machinery, is not as valuable as one producing $250,000 per year, with annual dividends aggregating $75,000.

GAS ENGINE efficiency might be theoretically increased by complicating the construction of the machine, but the increased friction therein involved would probably in practice tend to lower the efficiency. The aim of gas engine builders is to average all efficiencies and to build as simply as possible without sacrificing essential features.

IN COLORADO, so far as known, the Merryweather mine, on Irwin's peak, Clear Creek Co., at an altitude of 14,405 feet, is the highest in the State. The Sierra Blanca mine, near Garland, is 14,400 feet above the sea. The May Lundy mine, Mono Co., at an elevation of 11,108 feet, is probably the highest mine now being worked in California.

BEFORE putting in an electric lighting plant, a town should first find from other towns' experience how the municipal ownership idea worked. Usually it works unfavorably. It is not a question of honesty, but inability. No town can ordinarily install and continuously run an electric lighting plant as cheaply as under competent private ownership.

ZINC is now low in price and but little Colorado zinc ore is being shipped abroad. Ores under 45% zinc have little or no commercial value, and do not pay to ship foreign. While there have been some shipments made to foreign smelters, the returns are not reported satisfactory, and the quantity shipped has been largely overstated. The foreign smelters are no better equipped for treating zincy ores than are the United States smelters, but their coal, labor and supplies cost only about one-half what they cost in the United States; hence they are able to apply treatment which would be out of the question in this country. Freight rates have been obtained as low as $9 from Leadville to Swansea and Antwerp; consequently, the Colorado market is open to them with little freight discrimination.

THE miners of any locality in California have a right to organize a mining district and adopt rules and regulations not in conflict with the State or federal law. They have the right to create the office of mining recorder for such district and file location notices in his office. The policy of such action is not under discussion, but the right to so legally act exists.

A DOUBLE BELT having an arc of contact of 180° will give an effective pull of thirty-five pounds per inch width for an oak-tanned fulled belt and thirty pounds for other leather belts and six to seven ply rubber belts; or 950 feet per minute of 1-inch wide oak-tanned and fulled belt will transmit 1 H. P. and 1100 feet per minute of other leather belting and six to seven ply rubber.

AN air-tight suction pipe for a pump can be produced from ordinary iron pipe with screwed joints. Use graphite on the threads, screw them together tightly, cover the joints with a mixture of melted tallow and resin, of such proportion that it will not be brittle when it cools. It should be put on very hot. When ready for use plug the end of the pipe, apply a water pressure of 100 pounds, if possible maintaining it for two hours, and look for leaks.

CARBONATE OF LIME will not dissolve in water that has no carbonic acid in it, but will precipitate. If the feed water be highly heated in a heater and purifier (by exhaust steam, for instance), the carbonic acid can be removed and any carbonate of lime in the water will be deposited in the purifier, instead of in the boiler, thus avoiding incrustation of the latter. Sulphate of lime, however, can not be got rid of in this way, as it will not precipitate below 300° F.

ONE BARREL unslaked lime weighing 220 pounds will make 2½ barrels stiff lime paste, equal to 0.3 cubic yard. One barrel of lime paste and three barrels of sand will make three barrels of mortar, equal to 0.4 cubic yard. One barrel of unslaked lime will make 6.75 barrels mortar one part lime, three parts sand. Cement weighs 400 pounds gross per barrel, 375 pounds net. One cubic foot dry cement shaken down weighs 100 pounds and makes 0.63 cubic foot stiff paste, when mixed with 25% to 30% water.

THERE are three theories as to the origin of petroleum—that it is of animal, vegetable and mineral origin, the adherents of each theory adducing what they consider proofs. Opponents of the animal origin theory have claimed that, if so, nitrogen compounds would be found therein; and now that asphalt from near the Red Sea has yielded 2% nitrogen, advocates of the animal origin theory feel more positive than ever. Meanwhile those who may uphold the combined vegetable and mineral origin of the oil may be considered nearest the truth.

THE height of a reservoir bank above the highest water level is usually 4 feet for low and 6 feet for high reservoirs. When the depth of water at the side of the embankment does not exceed 30 feet the top of the bank may generally be 4 feet above the top water level. With a depth of from 30 to 50 feet the height should be 5 feet; and when the depth is 60 feet or over the height should be 6 feet. Trautwine suggests that the top width be 2 feet plus twice the square root of the height in feet. The inner slope should be 2½ base to 1 height, and the outer slope 1½ base to 1 height.

CONCERNING the "power" of a steam boiler, the word in that connection is not correctly applied, but is used because of a custom. The rating of a steam boiler is expressed in terms of its ability to evaporate a certain quantity of water into dry steam in a given time. Simply to say that a boiler has 10 sq. ft. of heating surface to a horse power, tells nothing and means nothing as to its evaporative effect. A single engine, having a single cylinder, should produce a "horse power" upon 30 lbs. of water evaporated into steam of 70 lbs. gauge pressure; a compound engine, having two cylinders and working at from 6 to 10 expansions, will produce a horse power for an expenditure of 20 lbs. of water; and a triple-cylinder engine, working at 16 to 30 expansions, should give one horse power for every 15 lbs. of water evaporated into steam per hour, in all of the above citations. The "power" of a boiler begins and ends with its ability to evaporate certain quantities of water in a given time.

OF the substances familiar to everybody, some occur, under ordinary conditions, in the three states of gas, liquid and solid. Water, for example, under the usual pressure of the atmosphere, passes into steam at 100° C., or 212° F., and freezes at 0° C., or 32° F. If the pressure is increased, the boiling point rises, and if the pressure is lowered the boiling point falls accordingly. The pressure and the temperature must both be taken into account. If the temperature is kept high, as in a steam boiler, a greater pressure must be exerted to maintain the water in a liquid state, and if the ordinary temperature were, on the average, 400° C. higher than it is, water would be known to us only as a gas. That is, steam at a temperature above 358° C., or about 759° F., cannot be changed to liquid by any pressure, however great. A similar state of affairs exists for every substance. That is, there is for every substance some point of temperature above which it cannot become liquid, and this point is called the critical temperature. Any gas will be easy or difficult to liquefy, according as its critical temperature is high or low. Oxygen, whose critical temperature is 118° below zero, resisted all efforts at liquefaction for many years; nitrogen, with a critical temperature of —146° C., was still more refractory, and hydrogen, whose critical temperature has not been exactly determined, had to be cooled to about 235°, or more, below the zero of the Centigrade scale before it yielded.

THE theoretical velocity with which water flows under a given head is 8.03 times the square root of the head. To find the pressure in pounds per square inch of a column of water, multiply the height of the column in feet by .434, approximately; consider that every foot elevation is equal to ½ pound pressure per square inch; this allows for ordinary friction. To find diameter of pump cylinder to move a given quantity of water per minute (100 feet of piston being the standard of speed), divide number of gallons by 4; square root of quotient will be diameter (in inches) of the pump cylinder. To find quantity of water elevated in one minute, running at 100 feet of piston speed per minute, square diameter of the water cylinder in inches and multiply by 4. To find the theoretical horse power necessary to elevate water to a given height, multiply total weight of the water in pounds by the height in feet; divide the product by 33,000; (an allowance of 25% should be added for water friction, and a further allowance of 25% for loss in steam cylinder.)

THE rate of combustion in a furnace is computed by the pounds of fuel consumed per square foot of grate per hour. In general practice the rate for a natural draught is: for anthracite coal, from 7 to 16 pounds; for bituminous, from 10 to 25 pounds; and with artificial or forced draught, as by a blower, exhaust blast or steam jet, the rate may be increased from 30 to 120 pounds. The dimensions or size of coal must be reduced and the depth of the fire increased directly, as the intensity of the draught is increased. Temperature of gases at base of chimney or pipe should be 600°, and fractional resistance of the surface of chimney is as the square of velocity of current of gases. Ordinarily from 20% to 30% of total heat of combustion is expended in the production of the chimney draught in a marine boiler, to which is to be added the losses by incomplete combustion of the gaseous portion of the fuel and the dilution of the gases by an excess of air, making a total of fully 60%. Temperature of a furnace is assumed to range from 1500° to 2000°, and volume of air required for combustion of one pound of bituminous coal, together with products of combustion, is 154.81 cubic feet, which, when exposed to above temperature, makes the volume of heated air at bridge wall from 600 to 750 cubic feet for each pound of coal consumed upon grate. One square foot of grate will consume on an average twelve pounds of coal per hour. In calculating horse power of steam boilers allow for: tubular boilers, 15 square feet of heating surface equivalent to 1 H. P.; flue boilers, 12 square feet; cylinder boilers, 10 square feet. Consumption of fuel averages 7½ pounds, or 15 pounds dry pine wood for every cubic foot of water evaporated. The Centennial standard is thirty pounds of water evaporated per hour from 100° F. at seventy pounds pressure.

CHLORIDE OF GOLD is readily decomposed by heat, the decomposition beginning at 180° when the monochloride is formed, and being completed with the formation of gold and chlorine at 220° to 230°. Whether dry or in aqueous solution, the trichloride is also decomposed by light, gold being deposited in scales in the latter case. Weak voltaic currents precipitate metallic gold from the solution of trichloride upon the negative pole. The solution of trichloride of gold is also decomposed by many reducing agents, such as organic substances, metals and protosalts; heating the solution in every case hastens the decomposition. Organic matter is sometimes present in considerable quantities in metalliferous veins, sometimes as graphite and anthracite. It also occurs in the coloring matter of fluorspar and smoky quartz. The reduction of organic matter is assisted by the action of light. Alkalies also quicken the action of organic matter. Alkaline carbonates act on hot solutions, half the gold being precipitated as hydrate, while the other half remains in solution in the form of a double chloride of gold and the alkali. Sulphur, selenium, phosphorus and arsenic all precipitate gold on boiling the solution of the trichloride. Many metals reduce chloride of gold, the action being, of course, more rapid in the case of the most highly electro-positive metals, such as zinc and iron. Lead sometimes gives fine dendritic plates of gold. Sulphuretted hydrogen precipitates sulphide of gold from both neutral and acid solutions, while phosphoretted, arseniuretted and antimoniuretted hydrogen all precipitate metallic gold. The lower oxides of nitrogen, nitrous acid, and many other "ous" acids and oxides effect the same decomposition. It is difficult, or, rather, impossible, to say what agents have in any particular instance been the cause of precipitation. In the case, however, of metals and of organic matter some indications occasionally still exist. Peat, for instance, has been found intermingled with small masses of nuggetlike pieces of gold, and in a Dakota mine filaments of gold crystallized on mine timber soaked in acid waters have been discovered. On a larger scale the Transvaal offers illustrations in the form of auriferous veins, the bituminous portions of which are unusually rich in gold. Of metals as the possible cause of auriferous precipitation, iron and copper pyrites, stibnite, galena, etc., when found associated with gold, may be enumerated.

The Empire Mines, Past and Present.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE W. STARR, Resident Manager.

Nestled in the foothills of the Sierra Nevada mountains, at an elevation of 2400 feet, the oldest and best known mining town in the United States—Grass Valley—flourishes with the vigor of pioneer days, tempered by a growth of fifty years. Grass Valley, now a prosperous city of neat homes, gardens, orchards and vineyards, is surrounded by beautiful drives and walks, shaded by magnificent native pines, oaks, maples and spruces, while the alder, dogwood, shrubbery and vines along the banks of its many brooks help to complete nature's dower to the place where gold in the quartz was first discovered in California.

About to Blast: Spitting the Fuse, Empire Mine, Grass Valley, Nevada County, Cal.

In the autumn of 1849 placers were discovered, followed by the discovery of quartz in June, 1850, which created no excitement until a man named McKnight, who had come from Newtown, camped on the summit of Gold hill, overlooking Boston ravine (now a portion of Grass Valley), and there discovered the Gold Hill ledge (October, 1850), the quartz of which, at its outcrop, was literally filled with gold, demonstrating clearly the source of the rich placers.

This discovery set the camp into the wildest excitement and was immediately followed by the discovery of quartz ledges on Massachusetts hill, Ophir hill and Rich hill (October, 1850). Other discoveries followed in rapid succession and many people rushed to Grass Valley to "peg out" a quartz mining claim, which was originally 30x40 feet.

What is supposed to be the first quartz mill was built by two Germans in November, 1850. The stamps were tree trunks shod with pieces of iron. This was followed by the Gold Hill mill in 1851. These mills nearly proved failures and in 1853 quartz mining had fallen to a low ebb, rising with the rapid evolution of the stamp mill to a flourishing state in 1857.

In 1867 Grass Valley had thirty stamp mills, 284 stamps and 1600 men working. Among the well-known mines then working were the following: Allison Ranch, Pennsylvania, Norambagua, Gold Hill, Peabody; Eureka–Idaho (now Maryland mine); Lone Jack, Omaha, Homeward Bound (now Omaha Consolidated; North Star, New York Hill, Rocky Bar, Massachusetts Hill (now owned by North Star Mines Co.); Ophir Hill, Rush & Laton, Keefe & Judd, Rich Hill, Magenta, Osborne Hill, Empire, Donahue (now owned by the Empire mines).

From 1867 the mines were supposed to be "petering out" and in 1879 Grass Valley was known as a worked out, dying camp, with but three mines in active operation, the Idaho, New York Hill and Empire, the first in "bonanza" and the other two in "borasco." In May, 1880, the New York Hill (now being reopened by the North Star Mines Co.) closed down, leaving the fate of the camp with the then great Idaho and the struggling old Empire. To the Empire mine Grass Valley owes a debt of lasting gratitude, for in the history of that mine, more than to all other circumstances combined, is due Grass Valley's growth from a temporary mining camp to an attractive city of permanent homes.

In the history of gold mining in California the Empire stands pre-eminent, not alone for its wealth, but for what the mine, above all others, has given in the way of example and earnest, well-applied endeavor. It is the pioneer in deep mining, and the first to regard Grass Valley mining a legitimate business, controlled by the same laws and conditions as should govern a well-managed manufacturing establishment.

The writer, when consulting engineer for Barnato Bros., South Africa, had to refuse many applications for positions. One, more persistent than usual, received a refusal of his application, as follows: "No, of course, I can not get a position. But I will get one yet, for I am going to America, to sleep one night in Grass Valley, that I may be a practical mining engineer." The remark is brought to mind because of the many formerly connected with the Empire mine whose names are household words in the mining world—George D. Roberts, J. W. Gashwiler, William Cliff, Thomas Mein, David Watt, David McKay, John Hays Hammond, Richard Angove, H. A. Tilghman, Cospee Thurston, V. M. Clement and James D. Hague.

What now constitutes the Empire mines is a consolidation into one ownership and management of what was formerly hundreds of claims. The nucleus of this amalgamation was the original Empire mine on Ophir hill, discovered in October, 1850, by George D. Roberts, and sold with adjoining claims in 1851 to Woodbury, Park and others, who owned a quartz mill in Boston ravine known as the Empire mill. In the spring of 1854 the Empire Mining Co. was incorporated, additional territory was purchased and operations commenced on a systematic basis. In 1865–66 new works were erected at an outlay of nearly $200,000, including a 30-stamp mill, then one of the finest in the State. The principal owner and manager at this time was Captain S. W. Lee, who clung to many of his marine ideas. The interior of the new mill was ceiled and painted and the superstructure so designed that it was always known as "the steamboat mill." In September, 1870, this mill was destroyed by fire and replaced by a 20-stamp mill. Mining operations continued until November, 1878, when, all pay ore in sight being extracted, pumping was suspended and the main incline, which had reached a depth of about 1200 feet on the dip of the ledge, was allowed to fill with water. Work was then commenced on a new shaft sunk on a parallel vein, known as Rich Hill ledge, which had been worked through the Ophir shaft. The product in free gold from May, 1854, to this period (no record being obtainable prior to 1854) is as follows:

BULLION PRODUCED FROM EMPIRE MINE, GRASS VALLEY, CAL., FROM MAY 1, 1854, TO OCTOBER, 1878—DERIVED FROM THE BOOKS OF THE COMPANY.

(Six-Stamp Mill, Crushing Ten Tons Daily.)

May 1, 1854, to December 31, 1854	$ 152,887 91
January 1, 1855, to December 31, 1855	192,231 67
January 1, 1856, to October 31, 1856	73,931 38
April 1, 1857, to December 31, 1857	72,654 74
January 1, 1858, to December 31, 1858	112,408 30
January 1, 1859, to December 31, 1859	121,443 44
January 1, 1860, to December 31, 1860	102,759 18
January 1, 1861, to December 31, 1861	72,413 04
January 1, 1862, to December 31, 1862	96,130 31
January 1, 1863, to December 31, 1863	59,374 43
	$1,056,234 40

Estimating the full running time of the mill as equal to an average of 300 days in each year, there are 2810 days, at ten tons daily, or 28,100 tons of quartz, giving as the approximate value of the ore crushed per ton $37.55, exclusive of sulphurets.

April, 1865, to December, 1865	$ 71,780 70
January, 1866, to July, 1866	71,111 31
August, 1866, new mill commenced, 30 stamps	25,367 08
September, 1866	18,727 13
October, 1866	13,814 45
November, 1866	22,025 65
December, 1866, repairing mill and moving hoisting works	4,327 33
January, 1867, to June, 1867 (mill partially idle)	58,927 80
	$ 286,081 45

Oct., 1867, to Oct., 1868	254,000 00
Oct., 1868, to Oct., 1869	178,000 00
Oct., 1869, to Oct., 1870 (mill partially idle)	123,000 00
Oct., 1870, to Oct., 1871 (30-stamp mill destroyed by fire, replaced with 20-stamp mill)	64,000 00
Oct., 1871, to Oct., 1872	110,000 00
Oct., 1872, to Oct., 1873	168,000 00
1874	119,000 00
1875	201,000 00
1876	120,000 00
1877	171,000 00
1878	117,000 00
	$1,625,000 00
	$1,056,234 40
	286,081 45
	1,625,000 00
Total to Oct., 1878	$2,967,315 85

The above statement includes free gold only.

(TO BE CONTINUED.)

Copper Alloy for Amalgamating Surface.

NUMBER II.—CONCLUDED.

It is Dr. Rose's opinion that the discoloration on the alloy plates is prevented by the weak electric current mentioned above. Aaron testifies that the same effect can be had when the usual copper plates are in use by placing them in contact with iron or some other metal which is positive to copper. The strips of iron bolted to the top and sides of the plate are said to be sufficient for the purpose, the copper being in that case unaffected by the acidity of the water, which causes oxidation and dissolution of the iron only.

Mr. Furman goes on to say that any one who visits the stamp mills of Gilpin and Clear Creek counties in Colorado, or other localities where sulphide ores are treated by stamp milling and plate amalgamation, will notice the tendency of the plates to become discolored. He says that his experience with the suggested alloy plate was more satisfactory than with the ordinary ones, and that this led him to experiment with plates consisting of aluminum-copper alloy. "I made three copper-aluminum alloys containing respectively 5%, 10% and 15% of aluminum, which were rolled into plates, amalgamated and subjected to various tests.

"I found that these plates, when immersed in the tailings and water from the creek, suffered practically no discoloration. I tried them also with water and freshly broken pyrites; with water and pyrites which had long been subjected to atmospheric influences, and with water containing small amounts of free acids and free alkalies. In every case they showed practically no discoloration. The plates were examined with a magnifying glass, to see if the gold was readily caught by the amalgamated surface. The results were so satisfactory that I inquired of leading manufacturers of rolled copper whether they could make me a few plates of a copper alloy containing 10% of aluminum. They replied that there was no market for such material, and that they could not undertake its manufacture."

Silver Smelting in Mexico

NUMBER II.

The sample mill is not in operation during the night nor on Sunday, except on the company's private business when it is pressing. The force of the sample mill, which sometimes reaches the number of 200 men and boys, handles 800 tons of ore a day, equivalent to forty cars.

Smelters always buy ores f. o. b. the railway station nearest to the mine and embody the freight in the treatment charge. The reason for this is that the smelter will get reduced rates from the railways according to their volume of business, while a miner or ore broker will not. In illustration of the terms on which ores are purchased at Smelter No. 3, I will here append an open-rate schedule furnished in 1898 to ore sellers shipping from a station on the line of the Mexican International Railway in the State of Durango:

Pay for all the silver contained $36.50 a kilo.

Pay for all the gold contained if not less than 3.43 grams per 1000 kilos. (or one-tenth ounce per 2000-pound ton) 62½ cents U. S. currency per gram.

Pay for 90% of the lead, not under 5%, 5½ centavos per kilo.

Add for excess of iron or manganese over silica 15 centavos per unit.

Deduct 20 centavos for each unit of silica in excess of iron contents.

Deduct 30 centavos for each per cent of sulphur over 3, the maximum charge being $4.50 per metric ton of ore.

Deduct 55 centavos a unit for zinc, if over 8%.

Deduct 55 centavos for each per cent of arsenic, antimony or baryta over 3%, all three added together.

FREIGHT AND TREATMENT CHARGES.

$20 per ton for ores containing 5% of lead.
18 " " " from 5% to 10% of lead.
14 " " " " 10% to 15% "
12 " " " " 15% to 20% "
10 " " " " 20% to 25% "
7 " " " " 25% to 30% "
4½ " " " " 30% to 35% "
2½ " " " " 35% to 40% "
½ " " " " 40% to 45% "

A premium will be accorded of:

$1.50 per ton for ores containing from 45% to 50% of lead.
3.50 " " " " 50% to 55% "
5.50 " " " " 55% to 60% "

Stamp tax has to be paid by the vendor of the ore.

The federal tax of 3% on the gold and silver value in the ore, as well as the mint tax of 2% on the gold, are paid by the ore purchasers.

It is hardly necessary to add that large producers of ore will get much more favorable rates, especially if they enter into long-time contracts.

ROASTING DEPARTMENT.—Ores containing more than 8% of sulphur should be subjected to calcination before smelting, to avoid an excessive production of matte and dragging too much silver into the by-products. Yet it is good policy not to roast ores very high in silver, but to throw them on a bed with only a small amount of sulphur in it, whereby the sulphur contents of the bed are not materially raised. Such a bed must be composed, however, of ores with a loamy gangue, like the ferruginous lead ores from the vicinity of Monterey; ores which would allow the silver ore to sift through the interstices, like quartzose ore, for instance, would not do. Furthermore, there are sulphide ores with coatings of horn silver, like "La Paz," from Matehuala, which should not be roasted, lest chloride of silver be volatilized. The largest portion of the roasting ore handled is concentrates from Pachuca, and tierras (fines) from Angangueo, which have to be crushed to pass through a No. 12 mesh screen. For various reasons, the owners of the smelter do not feel inclined to encumber themselves much with roasting ores. The principal material to be roasted remains, therefore, the matte falling at the blast furnaces. The first matte runs about 23% in sulphur; the concentrated matte less, say, 16% or 18%. There are six long-hearth roasting furnaces (calciners, hand roasters) without fuse box, which receive their charges from above through a hopper in the arch at the flue end and are discharged from opposite sides through two square holes in the floor near the fire bridge end. The roasted ore is raked through these holes into wheelbarrows placed under them.

A long-hearth furnace holds six charges of 4000 pounds of matte, or 3500 pounds of Pachuca concentrates. The reason why there is such a difference made in the weight of these materials is of a two-fold nature. In the first place, the concentrates, being lighter than the matte, reach almost to the crown of the arch when spread out in the furnace, and, secondly, the sulphur contents of the former are higher than those of the latter. The material in the furnace is rabbled every twenty minutes, and a charge is drawn every four hours. No attempt at agglomeration or sintering is made, the material being unsuitable for that operation, and the men not skillful enough to keep their floor clean, if it were done. After a charge has been drawn, the discharge holes are covered with iron plates, and the next charges are moved forward with paddles, when an empty space will be formed at the flue end on which a new charge is dumped from above. The charges are weighed up in trucks at the bins, and raised up on an electric lift to a trestle which runs across the furnaces at the flue end and branches off to the feed floor of a battery of gas producers. In the original roaster building there are five calciners. Each set of furnaces has a separate flue and chimney of ample section and a height of 75 feet. Originally wood was used for heating the furnaces. It is a splendid material for attaining a good roast, on account of its yielding a long flame. But the constant danger of the wood piles being set on fire by sparks from passing locomotives led to the discontinuance of its use. Different coals and different grates were tried without satisfactory results. Three gas producers were erected with the object of disposing of vast accumulations of coke waste, each 7 feet diameter by 16 feet high; cost, $2460 U. S. currency, f. o. b. factory. They are connected with the calciners through branches from an underground main flue, which is curbed with firebrick. The ash pits are laid in cement and are kept filled with water. The steam blast is furnished through a small pipe connected with the main steam pipe in the blast furnace building. The steam is wet, but this is no detriment.

These six furnaces roast seventy-two tons of matte or sixty-three tons of ore in twenty-four hours, hence cost of roasting will be:

	Matte.	Ore.
Labor	$1 07	$1 22
Fuel	1 06	1 21
Totals	$2 13	$2 43

To this must be added the cost of power for electric elevators, electric light, tools, repairs, etc., say, 30 cents. This will bring up the cost to, respectively, $2.43 and $2.73.

After the success of the Taylor producers had been established, three more were put up, making six in all. This number could accommodate twelve calciners, if necessary, yet it would be advisable to have two producers in reserve.

The main flue was entirely rebuilt, enlarged and extended over to the new calciners, at the same time making provision for the probable addition of more calciners.

The roasted material, as drawn from the furnaces, is dumped on a cooling floor paved with hard burned brick and there drenched with water, weighed, sampled and divided into lots, which have to be smelted away as fast as possible, as the cooling floors are limited in size. Roasted matte is used advantageously in replacing part of the iron ore in the blast furnace charge.

The smelting department is separated by a wide passage from the engine and boiler house, and in line with it is the furnace building. In it are ten cupolas, which are distant 25 feet from center to center of each other. This is insufficient for large furnaces, as considerable space between two furnaces is required to stack up the bullion produced during a shift, and sometimes more. The smelting department has undergone many changes and is still in a transition state, as we shall see below. The furnaces are of the side-feed pattern, are operated with a closed breast, and provided with syphon tap, except one which is used for matte smelting. They consist essentially of four parts—the crucible, the water jackets, the shaft and the chimney.

The crucible (hearth, sump, well) is enclosed in a casing formed by eight heavy cast iron plates—the curb plates—standing on a bottom plate of heavy boiler iron, not cast iron, with a rim of angle iron riveted to it, which conforms to the shape of the casing and keeps the plates in position. The casing, and hence the bottom plate, forms an elongated octagon. The curb plates are 3 feet 6 inches high, and consist of the front or dam plate, the back plate, two side plates and four angle plates. They are bolted together through lugs at their sides and are further firmly held together by a set of binders 2½ inches square. In the center of the upper edge of the front plate there is a semicircular cavity in which the slag spout is fitted. In the side plates there is a bowl-shaped projection in which the lead wells are built up. To economize in patterns by making them interchangeable, founders place this projection in the center of the upper edge of the plate. But this is wrong. The lead well should be placed as near the front plate as practicable. I located it at one-third of the distance between front and back plate from the front plate; it should come between two tuyeres. It is also wrong to detach this projection and bolt it on; a great deal of unthought-of trouble will be experienced with such an arrangement.

The crucible is built of firebrick laid in fireclay mortar, and has tapering sides, the dam and long sides having a steep taper, while the back wall slopes gently towards the front, and is even made thicker than the other walls to avoid the necessity of locking up too much bullion. The depth of the crucible may not be over 27 or 30 inches. Contrary to ancient practice, no steep (brasque) is used in shaping the crucible.

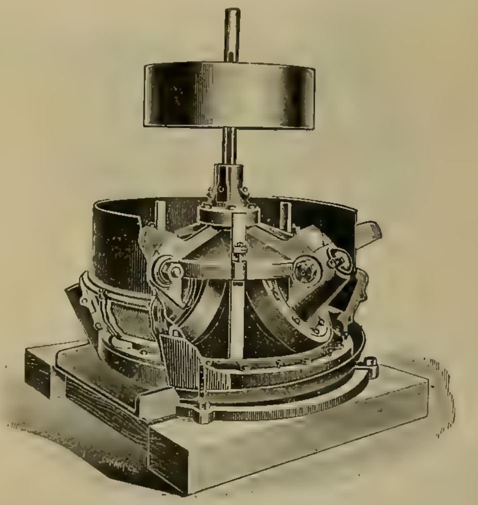
The syphon tap is a channel 6 inches square in section leading from the bottom of the crucible upward to the lead well; it does not go up in a straight line. It is wrong to make the section rectangular, with the long sides upright. In this case matte will invariably enter the lead well and clog it. To guard against the bulging out of the plates by the expansion of the brick walls, a space of 3 inches is left between plate and wall, which is tamped out with sand or a mixture of sand and clay.

The water jackets are resting on the topmost course of the crucible walls. They are made of cast iron in symmetric sections, in order to restrict the patterns to the smallest number. The sides consist of six sections each, the front and back of two each. In the side jackets a tuyere opening is cored out, which is 4⅝ inches in diameter on the outside and 3¾ inches on the inside facing the fire. The center of the tuyere opening is 11 inches above the bottom of the water jackets in the case of the large-sized furnaces, and 13 inches in the case of the smaller-sized ones. The water space of the jackets is 6 inches and the thickness of the wall is ⅝-inch.

(TO BE CONTINUED.)

The Griffin Mill.

On this page is illustrated the Griffin three roller ore mill made by the Bradley Pulverizer Co., 92 State street, Boston, Mass. Of this mill the manufacturers say while it "is a modification of the well-known Chilian mill, the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30°, the rollers themselves also being inclined to the central shaft of the mill, thus using the centrifugal force, as well as the weight of the rollers themselves, as a crushing agent.



Griffin Three Roller Ore Mill.

"The mill consists of a heavy and substantial bed, in which is fixed a crushing ring 5 feet in diameter and 6 inches wide, and inclined inwardly at an angle of about 30°. Above the bed or pan is a conically shaped carrier fastened to the main upright driving shaft. To this carrier are fastened the shafts on which the crushing rollers rotate, being secured thereto by rocking heads and trunnions so that the shafts may move in radial lines.

"The rollers are propelled or driven with an orbital motion, around and upon a crushing ring or die, and not only utilize their full weight in crushing the ore upon the die, but also use all the centrifugal force developed.

"The material to be crushed is fed by an automatic feeder into a feed chute, and is delivered in a channel inside of the die. From this point it is carried around and distributed upon the die by vertical and adjustable distributing bars or plows, while the necessary amount of water is being fed into the mill. The action of the rollers upon the pulp throws it against the screens, the portion which is sufficiently fine passing through into a trough outside, from which it is delivered through the discharge spout.

"The material not fine enough, by action of the mill, falls back and across the face of the die, and is thus brought in a satisfactory manner in front of the crushing rollers.

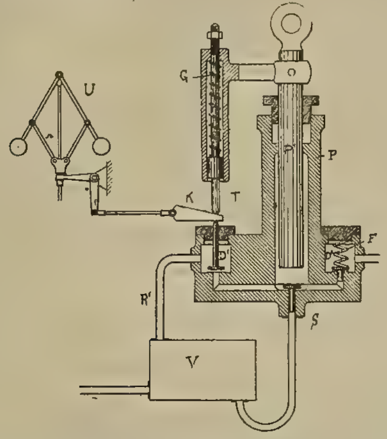
"The fact that the die is inclined inwardly makes it possible to procure a much more even distribution of the material to be crushed than can be done on either a vertical or horizontal die."

Mining and Metallurgical Patents.

Patents Issued July 24, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

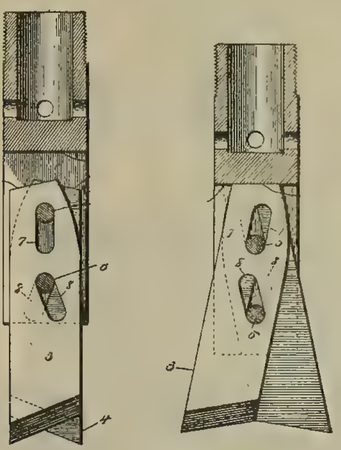
APPARATUS FOR REGULATING FUEL SUPPLY OF INTERNAL COMBUSTION ENGINES.—No. 654,140; R. Diesel, Munich, Germany.



An apparatus for supplying variable quantity of liquid fuel to combustion motor, combination with fuel supply, of pump operated by motor; suction valve connected to pump chamber; ventilating return valve D' located above and connected to top of pump chamber, chamber above valve with ventilating opening at top and return connection R' from beneath top to fuel supply; feed valve D^2, lower face of which, when closed, is at or below top of pump chamber; return valve normally opening at lower pressure than feed valve, and means for closing or throttling feed valve at part of stroke regulated by governor, or by hand.

◆

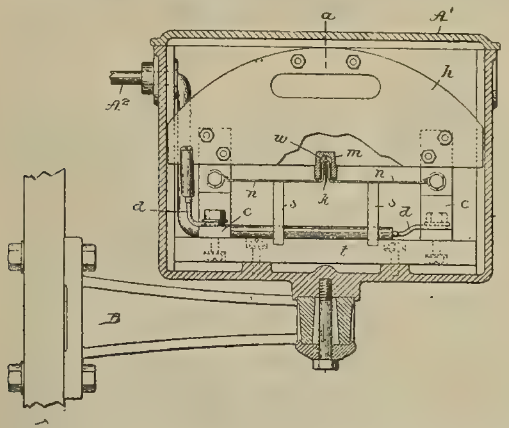
EXPANSION DRILL.—654,164; H. J. Lawrence, Elmore, Minn.



An expansion drill comprising drill stock slotted vertically at its lower end, in combination with overlapping expansible cutters formed with vertical elongated slots and oppositely inclined elongated slots, and having their upper ends oppositely inclined, and securing rivets one of which extends through vertical slots of cutters and the other through oppositely inclined slots thereof.

◆

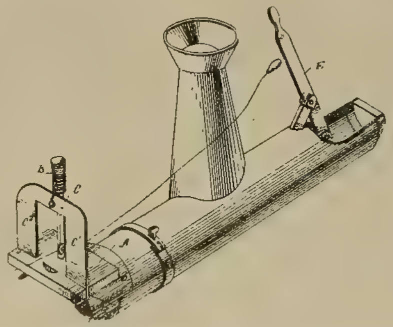
ELECTRICAL SAFETY FUSE.—No. 654,187; A. L. Stevens, New York, N. Y.



Combination with containing vessel, having means for insulated entrance therein of pair of conducting wires, terminal blocks in vessel connecting conducting wires and opposite ends of electrical safety-fuse wire, volume of oil maintained in vessel to submerge terminals and greater portion of fuse wire, fuse block m recessed to form chamber, pair of insulating clamping blocks h h supporting same, and perforated wedge partly filling recess in fuse block, recessed block and wedge operating to maintain section of fuse wire insulated and free from surrounding oil.

◆

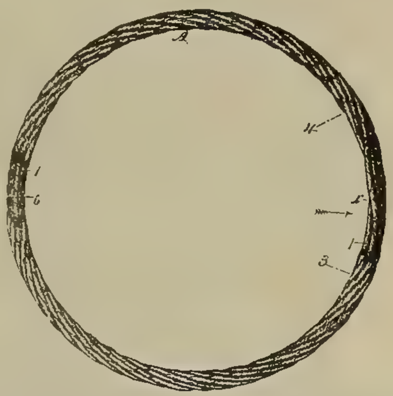
PIPE CUTTING DEVICE.—No. 654,213; J. W. Wilson, Shaner, Okla.



In pipe forming and laying device, combination of baseblock and standard thereon, cutter, spring connecting standard and cutter and normally holding cutter in elevated position, cord secured to cutter adapted to depress same against tension of spring and means for forming pipe.

◆

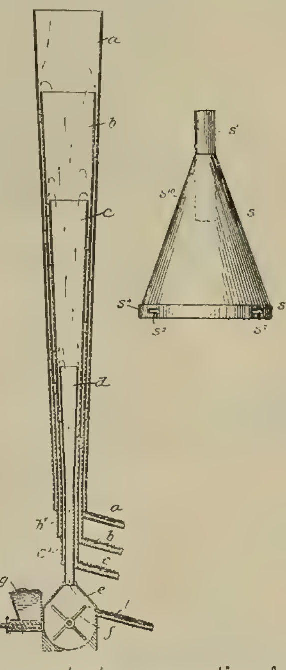
METHOD OF MAKING ENDLESS WIRE ROPES OR CABLES.—No. 654,225; A. D. Carnagy, Trenton, N. J., assignor to the John A. Roebling's Sons Co., same place.



The method of making endless wire rope or cable which consists in making form of article desired, having strands of same size and number as those of the rope or cable to be formed, and substituting for each of the outer form strands in succession, winding of strand from which the wire rope or cable is to be made and finally substituting for the core strand of the form the opposite ends of the strand which has been substituted for the outer form strands.

◆

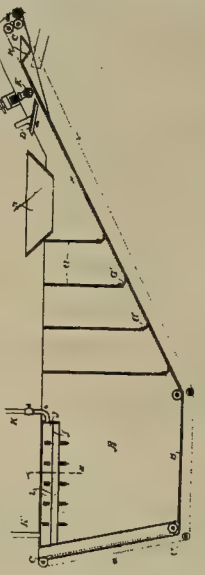
ORE CONCENTRATOR.—No. 654,290; A. H. Stebbins, Little Rock, Ark.



In an ore concentrator, supporting framework, settling chamber, supporting devices connecting framework and settling chamber, latter comprising plurality of similarly shaped separate pipes, and having gradually increasing cross-sectional area from bottom to top, each pipe extending into and part way up its next exterior pipe and below bottom thereof, agitator directly below settling chamber, communicating with central pipe of series, means for feeding ores into agitator, devices for forcing blast of air into and through agitator to lift entire mass of ores directly upward through central pipe into settling chamber.

◆

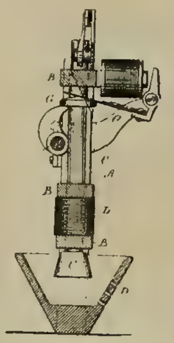
APPARATUS FOR WORKING ORES OF VALUABLE METALS.—No. 654,315; T. E. Leece, Bishop, Cal.



Apparatus for working ores, tank having endless traveling belt and directing rollers by which belt is caused to travel in close proximity with interior ends and bottom and is returned exterior to and beneath bottom of tank, means for supplying material to be operated upon to belt, overflow and separating device consisting of porous or filtered bottomed box with pipes through which vacuum or pressure may be produced within box and transverse supports against which filter or screen surface is supported from opposite sides.

◆

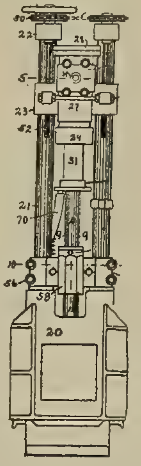
ORE STAMP.—No. 654,420; D. M. and J. E. Smyth, Pasadena, Cal.



Combination with stamp and shaft and cam for raising same, of an electro-magnet, circuit connections and switch actuated immediately before cam separates from stamp, for turning current into electro-magnet and spring intervening between electro-magnet and stamp and acted upon by armature of magnet for applying power of magnet through leverage of spring in accelerating fall of stamp.

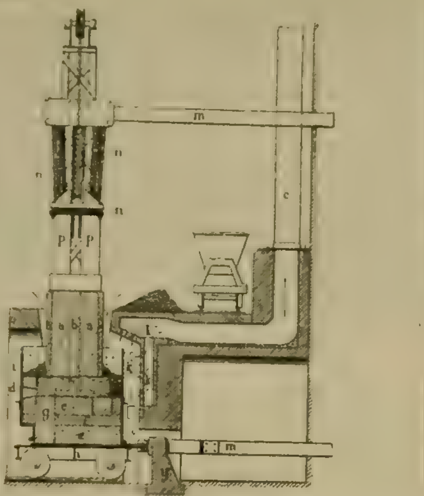
◆

STEAM ENGINE FOR ORE STAMPS.—No. 654,434; J. J. Brewis, Milwaukee, Wis.



Steam stamp, pair of cylindrical standards, bracket mounted on each standard provided with clamping device for securing it at any desired position by frictional contact with cylindrical surface of its standard, screw supported upon and parallel with each standard and engaging screw threads in brackets upon their respective standards, means for causing screws to turn together so as to raise and lower brackets uniformly, and steam cylinder supported by and clamped between brackets.

ELECTRIC FURNACE.—No. 654,463; H. Leleux, Paris, France.



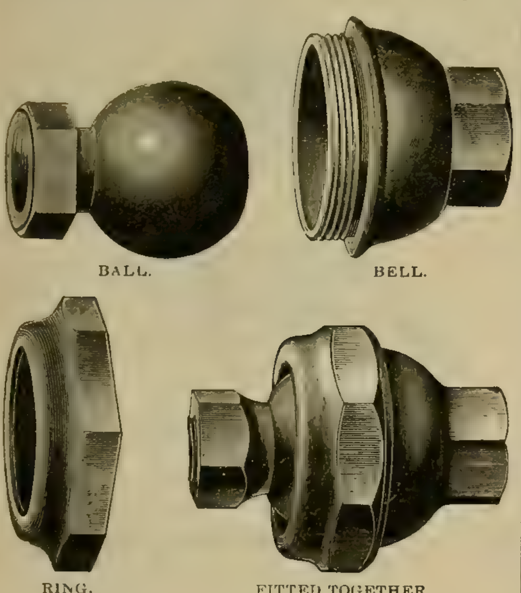
Electric furnace provided with vertically arranged electrode formed by one or more cores of carbon of high conductivity, each core being surrounded by an agglomerated mass of carbon having less high conductivity, each of these cores having its two inner faces provided with electric pad to provide large surface of contact between electrode and plates connected to lead, plates being secured against pad by wedges and keys to obtain permanent tightening whatever may be temperature of electrode.

The Moran Flexible Joint.

The accompanying illustrations show the improved Moran flexible joints—both sectional and fitted together. These consist of but three parts—the ring, ball and bell—requiring no springs or packing, and are not liable to get out of order or leak. They are of all-metal construction, flexible, tight and subject to no expense for repairs. They are used in railroad work, steam and water connections between engine and tender and steam heating connections between coaches, in permanent plants, providing for expansion and contraction in long lines of pipe, particularly in main pipe from boiler to overcome vibration or tremor and for pneumatic hoists and traveling crane connections, where either steam or air are employed. The makers consider them adapted for use in connection with compressors and rock drills, making a flexible and durable line of pipe, which will allow of any desired pressure being carried, thereby increasing the capacity of the drill and adding to its life, because of the method of applying the lubricant, viz., by simply placing a sight feed lubricator on the pipe line near the boiler and feed in when required without any stoppage, securing satisfactory result.

For dredging purposes the liquid joint makes a flexible and metallic connection for suction and discharge pipes on dredgers, through which water, sand, gravel or rock may be conveyed.

They are also used in large power plants, temporary steam lines, pumping service in mines, and are applicable to all classes of machinery requiring a flexible conveyor of gas, steam, air or liquid, and because of their compact construction can be employed on the inside of boilers, pipes, etc.



BALL. BELL.

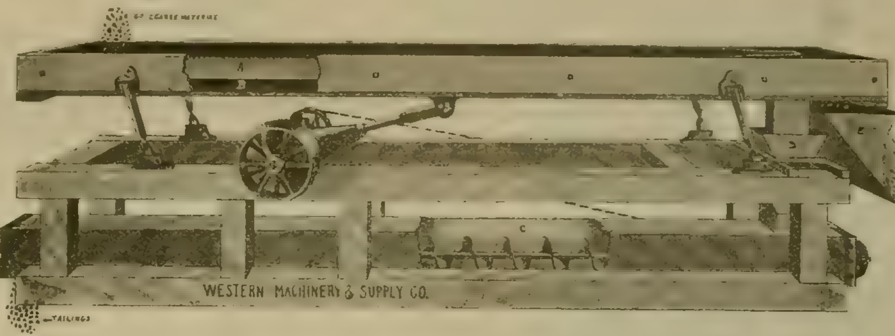
RING. FITTED TOGETHER.

Straight Flexible Joint for Steam, Air and Gas.

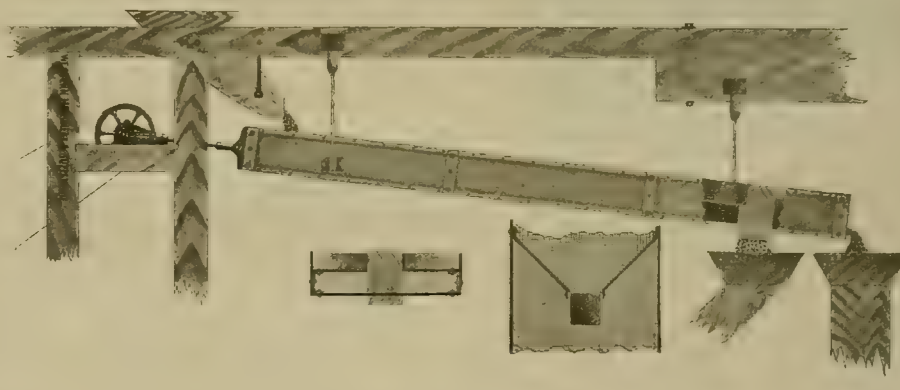
These joints are carried in stock by the Joshua Hendy Machine Works, 38-44 Fremont St., San Francisco, Cal.

Vibratory Screens.

On this page are depicted an inclined vibratory screen built almost entirely of steel. The screen is hung from the structure with a slight incline. The device may be, however, made to screen on a horizontal plane. The material drops into the screen at the head end, and, by reason of the vibratory movement given the screen by a crank running at a certain speed, immediately takes an outward movement towards the end of the screen, the distribution of the material, after separation, being arranged so that the tailings are deposited first through a small chute near the end of the screen. The fines travel onward along the floor of the screen trough and fall over the end, to be used as desired; the screen plates are adjustable.



Vibratory Screen and Separator.



Inclined Vibratory Screen.

The vibratory screen and separator is a combination of a vibratory screen and spiral conveyor, intended for use where the tailings, after they are separated from the fines, are to be returned to the crusher to be reground. The screening trough is supported by bar springs connected with the trough by pivots and at the lower end rigidly fastened to the structure, set at a certain angle; when motion is given to the screen by the crank which is placed under the center, the screen oscillates in such a manner that the material is made to travel onward towards the end. In the illustration A is the screen plate, B the floor which carries the screened material onwards towards the end of the machine. The tailings travel onward over the screen plate and fall through an opening into the chute D, and are then conveyed back towards the receiving end of the screen by the spiral conveyor C. The application of a belt to the driving pulley will operate the screen and spiral conveyor at the same time. This is accomplished by means of a sprocket on the opposite end of the crank shaft, and to which is attached a link-belt chain which, by another sprocket and bevel gears, drives the spiral conveyor. The screen may be made without the return conveyor, may be run independent of any line shaft and by means of an electric motor. Both appliances are made and furnished by the Western Machinery & Supply Co., 159-161 La Salle St., Chicago, Ill.

Some Mines of China.

A. Mathez, who went to China some months ago, has returned, and the Denver Republican states that the party he was with did not have time to go over the entire field, the Boxer insurrection compelling them to suspend operations very soon after arriving on the ground, but that he traveled several hundred miles and made a careful examination of the placers of Chai-li'rh and of a lode mine at the same place. He says that the main gulch is rich virgin ground, the Chinese being unable to work it on account of the water. On both sides of this gulch are lateral gulches above high-water level and from which a considerable amount of gold is extracted by the primitive methods of the Chinese. They do not attempt to wash the ground from the surface down, and even if they had giants they could do nothing, as the introduction of water would cause an expense not warranted by the output. The lateral gulches are worked by tunnels, seldom more than 2 feet high, with which the native operators drift on bedrock, small boys being employed in the work, who crawl into the tunnels and bring out the dirt in baskets to be washed in the stream of the main gulch. Instead of working from the bottom of the gulch, the miners commence at the top and work down, carrying the tailings up hill. The ground in these dry gulches averages about 15 cents a yard, and is worked at a profit, with all the dirt handled in this way. The current rate of wages is $3 gold a month, and board, the latter costing about $3 a month, making the total expense about $6 a month for each man. The main gulch is a good proposition for an elevator, as it is comparatively flat with a good supply of water. Mr. Mathez says that while they did not have time to make a thorough examination of the main gulch, it is known to be rich, and with the installation of a modern plant could be made to pay handsomely.

The lode mine examined has been worked successfully for many years, but the deepest workings are not more than 150 feet from the surface. One vein examined has a body of ore 18 inches wide, carrying three and one-half ounces of gold and 20% of copper. The ore is hauled by wagon or pack mules to Tien Tsin, a distance of 150 miles, at an expense of about $10 a ton. The ore is generally carried as ballast to Swansea at a very low rate, and after all expenses of mining, transportation and treatment nets about $100 a ton. The methods of the Chinese in lode mining are similar to those of some Mexicans, with the difference that instead of using a notched stick the Chinese use rough ladders, or make steps in the solid wall, carrying heavy loads of ore on their backs.

The country is entirely destitute of timber and though the mine was stoped out to the surface the crevice was left without any support whatever. They use a table that in some respects slightly resembles those in use in this country for concentration, which is worked by hand, an attendant keeping the pulp stirred up with a rake; even with this crude appliance they manage to save 80% of the value contained in the ore. Mr. Mathez says that after many years' experience in the mines of the United States, he has never seen a district where a mine could be put on a paying basis at so short a distance below the surface.

No examination of the coal and timber land was made, but Mr. Mathez went into one coal mine that is being extensively worked on a seam of 18 inches of coal, in three different veins of about 6 inches wide. The coal is reached by an incline with steps in the solid rock going to a depth of 80 feet vertically. The vein is then followed on its incline and the workings are now about 120 feet below the surface. When asked why a shaft was not sunk to the coal body, the operator replied that the cost of hoisting would be more than the coal is worth. Still, operations on this mine are conducted at a good profit. Everything in the way of mining is carried on in the crudest way. No machinery is used except the table, and the miners confine their work to the ore alone, taking as little dead rock as possible. In many places boys are employed to take out ore from veins not more than 12 inches wide.

Precipitation in Cyaniding.

To THE EDITOR :—Under "Concentrates," in the issue of June 23, 1900, appeared the following :

> The temperature of the cyanide solution has an appreciable effect on precipitation ; many cyanidists say that at a temperature of 90° F. there are better results than when it is lower.

I know there is excellent authority for this statement, but my own experience does not confirm it. Generally speaking, chemical action is more rapid in warm than in cold solutions ; but, if so with cyanide solutions, the difference is so slight that I have never been able to detect it. I have secured as good results at 33° F. as at 120 F°. With other conditions right, perfect work can be done with solutions almost freezing cold.

In the same issue is the following :

> It is the opinion of some cyanide experts that, so far as the chemical part of the process regarding the solution of gold by cyanide is concerned, there is not much room for further advance, and that whatever improvement is made will be largely of a mechanical nature. It is, however, generally conceded that in the matter of precipitation of gold from the cyanide solution there is yet much to learn.

While that paragraph might have had the weight of many authorities back of it a few years ago, the opposite of the statement is certainly nearer the truth now.

At the Schmidt & Johns mill, at Silver Star, Mont., tailings were treated from half a dozen yards in one season and royalty was paid to four different owners. Some of the tailings treated very nicely. Other piles required the utmost care and skill, and even then it was not possible to make as good an extraction as one would wish. Not only was a perfect check kept on the heads and tails of each vat, but record of the tonnage of each solution was kept, with its assay value. At the end of the season the superintendent, P. C. Waite, tabulated his records, and it was found that every dollar entering the zinc boxes had been accounted for. This is not an exceptional record. Others are making it every day in Montana. It is made by C. L. Dahler, at the Iron Rod mill, with zinc shavings on solutions from refractory, slimy tailings. The files of the MINING AND SCIENTIFIC PRESS are in evidence that it is made at the plant of the Montana Mining Co., Ltd., at Marysville. (See article by C. W. Merrill, "Notes on the Alleged Shortage in Cyanide Bullion," MINING AND SCIENTIFIC PRESS, July 8, 1899.) When a man's assays show that he should have over a third of a million dollars in his clean-ups for the season, and he has every dollar of it, surely it can not be said that he has "yet much to learn" in the way of recovering the gold from his solutions.

But how is it in other parts of the world? A letter from Alfred James of London to the writer, under date of April 24, 1900, bears directly on this point, and I make the following extended extract from it. He says :

"I have read with much interest your contribution on 'Successful Precipitation From Solutions Weak in Cyanide' to the MINING AND SCIENTIFIC PRESS of March 24th, and note you state, in a kind reference to my work, that where I would use '1 cubic foot of zinc shavings to one ton of solution passing through the extractor each twenty-four hours, less than half this amount has been in use with us in Montana the past summer.' It is just possible that in the papers I have written I did not make myself sufficiently clear when I stated that 1 cubic foot of zinc shavings to each ton of solution will treat perhaps the most refractory solutions met with in practice. We have been treating solutions containing practically no free cyanide at all—including those derived from the filter bottoms in the sluicing out of the tailings—with a practically perfect extraction, the effluent amounting to less than one grain of gold per ton, using less than half a cubic foot of zinc per ton of solution treated daily. Our boxes in normal work all over the world are designed on the basis that three boxes, each of which has six 1000 cubic inch capacity compartments filled with zinc, or 11 cubic feet of zinc in all, will treat daily forty tons of ordinary solution ; and this ratio practically applies to the whole of the Indian plants, some of which are of quite large capacity, to those in Eastern Asia, and to a large number of those in South Africa, in New Zealand, in Australia and elsewhere.

"In writing the paper to which you refer, I had particularly in view solutions resulting from the continuous treatment of weathered slimes and tailings, and thus containing a large quantity of soluble salts—at times even yielding a faintly acid test. It was asserted that such solutions could not be treated effectually with zinc in any quantity, and the particular object of the paper was to point to the mines of Johannesburg, where this solution occurred, that with two boxes in series they could treat even this solution effectively.

"As a matter of fact, the electrical precipitation process has now been displaced at the majority of the mines by zinc precipitation, with the addition of lead salt. I anticipate, however, that before long they will discover—provided they do not start the boxes with fresh zinc—that the lead salt, too, is entirely unnecessary. They have for some time past been treating slimes solutions in the Lydenburg district without the addition of any such salt."

I would say the trouble is to get enough gold into solution ; there is no trouble getting it out. Surely, there are few cyaniders but would like to make a little better extraction than they are able to. I would say there is "much room for further advance regarding the solution of gold by cyanide," and that it is reasonable to suppose that such advance will be made. I believe there can not be much improvement in the way of the mechanical part of the process. Nevertheless, there are difficulties preventing the cyaniding of certain ores and causing unaccountable losses with some material which in time, with study and work, may be overcome. There is room for improvement along this line ; but I can not see where there is possible room for improvement in precipitations when to-day everything is recovered from solutions, clean or foul, and whether containing free cyanide or otherwise. What more can one ask?

Helena, Mont., July 23. MATT W. ALDERSON.

The Gardner Process.

To THE EDITOR:—The American Copper Mining & Extraction Co. of Denver, Colo., owns the patent of the Gardner process of copper extraction, which has been tested and considerably discussed of late. An experimental plant to exemplify this method of extraction has been established here by P. M. McCaffrey. On July 23, 1900, a special test was made of 148 pounds of partially oxidized copper ore from New Mexico. After being pulverized to about 20 mesh the ore was thrown into a small vat and about thirty gallons of water turned in from an adjacent tank. Then twenty pounds of sulphuric acid and three ounces of common salt were added. After agitating the solution a few minutes a half pint of nitric acid was added, and a few minutes later about a half ounce of permanganate of potash ; and during the agitation, which was kept up for about half an hour, a considerable quantity of hot water was gradually introduced. The action of the salt changes part of the sulphuric acid to hydrochloric acid and that of the permanganate produces nascent chlorine and doubtless aids as an oxidizing element. The combination of hydrochloric and nitric acids forms aqua regia, a solvent for copper. The resultant solution was then drawn off into the precipitating tank, containing a perforated, revolving copper cylinder, the latter containing about fifteen pounds of scrap iron. The cylinder was revolved in the solution for twenty minutes, during which time the sulphuric acid, which has a greater affinity for iron than for copper, liberates the copper and takes up the iron, the copper precipitates settling to the bottom of the vat. After the liquid is drawn off the precipitate is scraped into a drying pan, dried and smelted in a small furnace and the metallic copper poured off. It is claimed the liquid, after precipitation, is returned to the solution tank, to which 15% of the original amount of chemicals is added, and that a second treatment results in extracting what may have failed to dissolve in the first treatment. The patentees and promoters of this method claim for it an adaptability to the treatment of low-grade oxidized copper ores, and that it might serve as a preparatory process to cyanide work where the existence of copper in gold ore proves a hindrance to cyanidation. W. A. SCOTT.

Denver, Colo., July 24.

Relative Heat Efficiency.

To THE EDITOR:—In the statement in the issue of July 14th that a ton of coal (2000 pounds) has 28,000,000 units of heat while a barrel of petroleum has 3,500,000, or one-eighth as many, I think no allowance was made for loss in ash and waste gases in burning coal, but allowance was made for waste in burning the oil.

My records show that a general average efficiency of coal burned direct in forges is 10% secured of the theoretical value and in burning oil about 75%, so that such a comparative statement might read like this:

A ton of coal (2000 pounds) has, theoretically, 28,000,000 heat units, 10% of which are available on work in forge fires, or 2,800,000 heat units. A barrel of 42 gallons, or 275 pounds, petroleum has a theoretical heating value of 5,775,000 units, 75% of which are available on work in forge fires, or 4,331,250 units. A barrel of petroleum is equal to a little over one and one-half tons coal. W. J. BROWN.

Philadelphia, Pa., July 19.

"Whin" and "Quartzite."

To THE EDITOR:—"Concentrates" recently defined "whin" as a local name for quartzite, while R. B. Symington of San Francisco claims the name for igneous dyke rocks. Both appear to be right, as the term is differently used by different people, and the Standard Dictionary states that "whin" or "whinstone" is a local British word, applied to "any hard, dark-colored rock," as "basalt, chert or quartzose sandstone." W. J. S.

Marysvale, Montana, July 23.

Deep Mining at the Utica Mine, Angels, Cal.

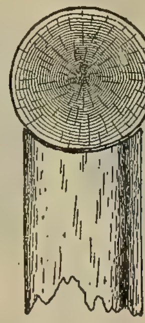
In the issue of Oct. 7, 1899, appeared an illustrated article, with the above caption, read by J. H. Collier, Jr., of Berkeley, Cal., at the Sept., 1899, meeting of the American Institute of Mining Engineers in San Francisco, Cal.

In discussion thereof, F. H. Probert, Neudorf, Anhalt, Germany, in a communication to the secretary, says: I have read with much pleasure Mr. Collier's valuable paper. But the system of timbering which he describes as used in the levels, stopes, etc., though it must be admitted to be very strong and safe, seems to me somewhat extravagant. The amount of timber required every month for such a system must be enormous, and only where suitable material could be cheaply obtained would such a plan be economically practicable.

The first point which strikes me is the unusually great diameter of the timber employed.

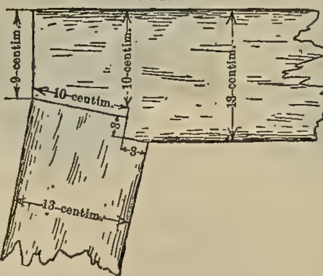
In the mines of Pfaffenberg and Meiseberg, which are under my supervision, the country rock consists of argillaceous slates, traversed by innumerable small fissures or joints, dipping at all angles and striking to all points of the compass. Undoubtedly this network has been caused by the upheaval of granite masses in the vicinity. Each fissure is accompanied by a more or less well-defined gouge or fluccan, caused by the rubbing together of the slates at or after the original disturbance. In such a mine the timbering must be of the very best quality and design; but we are compelled to exercise economy in this respect. It is often necessary to timber a level, both at the top and on both sides, for from 150 to 200 meters. Thurstock timbering, supplemented by poling, is our general method. The posts are either round or rectangular, and seldom more than 20 to 25 centimeters in diameter. The foot of each post is set firmly into the floor of the level, or, when no sound footing is obtainable, sills are used. The caps are also either round or square, and of about the same diameter. When the roof alone needs support, we simply cut a shallow curved notch in the top of the post to take the shape of the cap (see Fig. 1); but when both the roof and sides of the level are insecure, we cut the timber as shown in Fig. 2. This part of the work is all done underground. The posts and caps, having been sawn on the surface into the previously measured lengths, are then sent to the working place, and the timbermen, kept exclusively for this work, cut the notches and fit them together. Such men are paid at the rate of 2.50 marks (about 62 cents) per shift of ten hours, or, whenever practicable, by contract, according to work done.

FIG. 1.



Post and Cap to Support Roof Only.

FIG. 2.

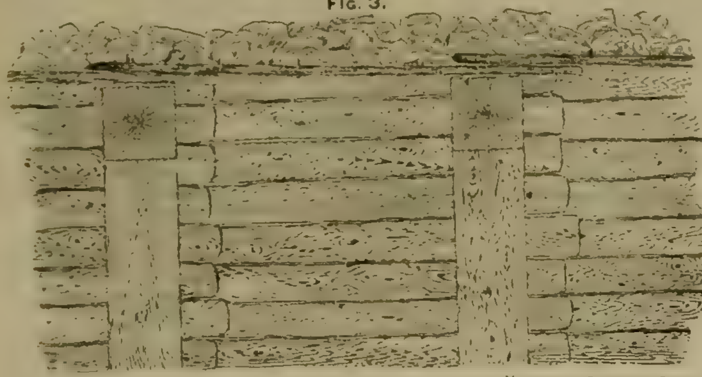


MINING AND SCIENTIFIC PRESS.

Post and Cap to Support Both Roof and Side.

In very loose ground, poling is resorted to. Here again I am compelled to think that the poles used at the Utica mine are unnecessarily bulky. Our poles rarely exceed 2 meters in length and from 15 to 18 centimeters in diameter. They are made of pine, which is found to be very good for the purpose. When we encounter running ground, posts and caps are set up about 1 meter apart, and the whole ground is made secure in the manner described by Mr. Collier, the only difference being that we use oak laths instead of poles. These laths are from 10 to 15 centimeters wide, 4 to 5 thick and 80 to 120 long. One end is sharpened to allow it to be more easily driven into its place by blows from a hammer. The man who superintends the hydraulic pumps makes such laths in his spare time at so much a hundred. This system of timbering is shown in Fig. 3.

FIG. 3.



MINING AND SCIENTIFIC PRESS

Poling with Oak Laths.

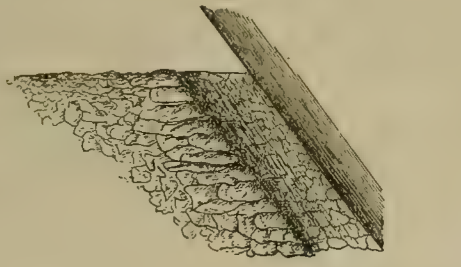
It is calculated that each running meter costs 15.70 marks (about $3.90), as follows:

	Marks.
Timber, 13 centimeters wide, 16 broad and 5 meters long, cut into lengths of 2.2 and 1 meter	4.00
Wages for cutting this from the rough by hand saws	.70
Poles (75 pieces required for every meter of level)	4.00
Wages for cutting these poles	2.00
Wages of two timbermen	5.00
Total	15.70

For the permanent timbering of levels, oak is used wherever possible. It lasts from ten to fifteen years, whereas pine lasts only four or five years, so that, in the long run, oak is more economical. It is found, however, that where there is much water, pine is better. For the temporary timbering of stopes, pine is almost always used.

In the stopes, I am of the opinion that much more could be done with the "deads" than is set forth in Mr. Collier's paper. If I understand his account, it implies that a great quantity of such material is obtainable from the driving of levels and the development of the ore bodies. Here in the lower Harz mountains we make use of these "deads" in many ways. Instead of using timber to make ore chutes and manways, we employ two men to select the largest and best pieces of waste rock and to build with these to the required height, as the stope is raised, the necessary chutes. (See Fig. 4.) These men are paid 1.30 marks (about 33 cents) per square meter of walling. The chutes require practically no repairs, and are absolutely solid if properly built. No cement of any sort is used.

FIG. 4.



MINING AND SCIENTIFIC PRESS

Construction of Chutes with Waste Rock.

Again, the miners themselves have to sort all the rock and put the ore into the chutes. The "deads" are stacked up in the form of a wall to support any loose ground, the fine stuff being used to make a good floor for the stope. Should a mass of rock become loose, it is immediately secured by the miners with a post and cap, until it can be supported by "deads," when the post is withdrawn, so that practically no timber is lost. As the stopes are worked out, the space below is filled with "deads." We find this much cheaper than putting in square sets and then filling in with "deads."

* * *

COMMISSIONER HERMANN of the General Land Office has decided to continue for a reasonable time the suspension of about fifty whole townships in Los Angeles, San Francisco and Visalia land districts in California from disposition under the agricultural laws on representations that they contain valuable oil deposits. A thorough inquiry into the true character of the lands is now in progress. Petitions and sworn protests have been filed with the General Land Office setting out that vast areas of non-agricultural lands in California have every indication of containing valuable deposits of oil. The land office last February ordered the suspension of these townships in view of the controversy over their value as oil lands. The action is in line with a recent decision of Judge Ross of the United States Circuit Court for the Southern District of California affirming the right of forest lieu selection scripholders to file on land not legally known to be mineral, regardless of placer mining locations. This was a test case, one of the many similar cases pending where forest lieu selection was made on land alleged to be oil land and therefore reserved for disposal under the mining laws exclusively.

Qualitative Tests for Boracic Acid.

TO THE EDITOR: It seems not to have occurred to the authorities on this subject to test the effects of the distilled alcoholic vapors on tumeric paper. We find by repeated experiment that if applied in the following manner the presence of boracic acid in a mineral borate is rendered more certain and delicate, especially when in traces only.

Boil vigorously in a test tube—about 2.5 centimeters diameter and 20 centimeters long—a few cubic centimeters of wood alcohol (common alcohol will do also), to which a decigram (.10 gram) more or less, of the mineral pulverized, and about one-half cubic centimeter of muriatic acid have been added. While boiling hold the moistened end of a strip of tumeric paper in the vapors near the mouth of the test tube. Much boracic acid will begin to color the tip of the paper red very quickly, and a little only after boiling down awhile. Muriatic acid, in the absence of borates, finally produces a dirty grayish brown color. Now, if the paper is dipped and agitated in a little water to which a few drops of ammonia have been added, the paper, where effected by the vapors, will turn purple to deep blue, according to the amount of boracic acid present. The contrast with the red color produced by ammonia on the unaffected parts is very marked. WADE & WADE.

Los Angeles, Cal., July 28.

The Cost of Testing a Mine.

Several inquiries have been received from eastern persons regarding the probable cost of the examination of mining properties, and leading brokers report that they are constantly in receipt of letters, asking for information on this matter. In many of these cases the writers exhibit a remarkable ignorance of what is required of a mining engineer in the examination of a mine. One broker was asked to employ a competent man at an expense of not to exceed $50 to examine a placer mine in the western part of Routt county containing nearly 2000 acres. As traveling expenses would amount to more than twice that sum, no one has yet been found willing to go, and in an examination of a placer property recently concluded, an expert was on the ground nearly six weeks in arriving at an approximate conclusion regarding the value of a tract of 2500 acres.

The expense of examining a mine or prospect varies greatly, important factors being the character of the property, the character and extent of the ore body, the amount of development, the distance to be traveled, the modes of conveyance and the eminence of the engineer; for prospects with trifling development the charges of engineers are comparatively light, but for mines which have large bodies of ore exposed an examination frequently runs up into thousands of dollars, as besides the fee of the engineer, numerous assays must be made, assistants are required to aid the engineer, and frequently many tons of ore must be run through a testing plant to determine the best methods of treatment. Less than two years ago the examination of a large mine in this State involved the making of 1100 assays at a cost of more than $1500, and the treatment of 500 tons of ore. In addition to these expenses must be taken into account traveling expenses, hotel bills and incidentals, such as the purchase of necessary tools, the employment of extra labor, etc.

Average engineers expect to receive as fees not less than $25 a day and expenses. This is not extravagant, as few even at that figure make more than an ordinary professional income during the year, while many are fortunate if they net the average wage of a bookkeeper. Engineers of established reputation make much higher charges. There are several engineers in this State who will not look at a mine for less than $1000, and many instances can be cited in which the engineer's fee, exclusive of expenses, was as high as $3000. This class of expert engineer, as a rule, declines to examine anything but developed mines, or make general reports covering large areas of mineral territory, which include geological and topographical features, water supply, engineering possibilities and matters of that kind, which require exceptional skill and experience. On the other hand, there are in this city not fewer than 100 good engineers who will make examinations of small mines and prospects for $100 to $500 and expenses, dependent upon the distance from Denver and other factors mentioned. Large mining syndicates usually employ their engineers by the year and pay large salaries. Several Denver men receive $10,000 a year with the privilege of making outside examinations, and one Colorado man in the employ of a London syndicate receives an annual income of about $50,000 as consulting engineer for several companies. To make the trip to Routt county, mentioned above, would require $1000 for a competent engineer, $200 for traveling expenses, $125 for hotel bills, and the wages of two men at $2.50 to $3 a day for six weeks. The engineer could probably be secured for $25 a day, and by increasing the force of laborers so as to cover the ground more rapidly, the total expense would be materially reduced, but in that case it might be necessary to employ an assistant to the engineer to enable him to keep his record of extraction up to the work of the men digging the pits.—Denver, Colo., Republican.

Jasper R. Rand.

J. R. Rand died at Montclair, N. J., July 18th. He was born September 17, 1837, in Westfield, Mass.

His earliest business connection was with his father, who was a manufacturer of whips, when Westfield was the headquarters of that industry. In 1865 his father retired from business, and Mr. Rand and his younger brother, Mr. Addison C. Rand, succeeded him. In 1870 he removed to New York and was for a time associated with another brother, Mr. Albert T. Rand, president of the Laflin & Rand Powder Company. In 1872 Mr. Addison C. Rand began the manufacture of the Rand rock drills and other mining machinery, and the two brothers subsequently organized the Rand Drill Company, with Mr. A. C. Rand as president and Mr. J. R. Rand as treasurer, which arrangement continued until the death of Mr. A. C. Rand in March, which left the chief office vacant, when Mr. J. R. Rand was elected to the position. He leaves a widow, a daughter and a son, the latter now representing the Rand Drill Company in Paris.

California Debris Commission Report.

The annual report of the California Debris Commission has been submitted to General John M. Wilson, chief of engineers, and has been made public by him.

It is shown that the amount of money expended in this work during the past fiscal year was $12,591. The commission has, since it organized, received 474 applications to mine. Three hundred and sixty-seven permits have been granted. Thirty-seven permits have at different times been temporarily suspended, generally on account of neglect to comply with instructions concerning the impounding works or on account of accident to those works. One hundred and forty-five permits have been revoked since the organization of the commission, in most cases because the mines have been worked out or abandoned or changed hands.

The commission has been informed by the proprietors of three mines working under permits that their operations were stopped during the year by injunctions issued by the court of Sutter county. When the first case of this kind occurred the commission requested instructions as to its duty in the premises, and the attorney-general held that as there appeared to be no question raised as to the validity of the permit issued by the commission it was not expedient for the commission or any department of the Government to intervene in the suit. Accordingly the commission has taken no action in these cases.

The report states that the total amount mined under permits during the year is estimated at 1,500,000 cubic yards.

No plans for the improvement of the San Joaquin river have been made by the commission for the reasons that this stream is but slightly affected by mining debris and its improvement is under the charge of the engineer officer in whose district it is located. A former report to Congress by the commission relative to its investigations as to sites for restraining dams or works in the Yuba river is briefly referred to. These proposed plans for the improvement of this stream contemplate the construction of various works. It is estimated that the total cost will be $800,000. There is now available $500,000 for this purpose. The fact that the amount thus available is not equal to the estimated cost of the proposed works has caused some uncertainty as to the possibility of beginning work until further appropriations are made. Full illustrated description of this work was given in the issue of June 23, 1900.

MINING SUMMARY.

ALASKA.

The latest rush is from Juneau and Douglas Island to Glacier Creek district, above Juneau, on a direct line between Sheep creek and Berner's bay.

Gloomy reports come from overdone Cape Nome, where exists sickness and suffering and a prospect of worse.

A stampede is reported from Dawson and Circle City to the Tanana, where 40 cents to the pan is reported.

Letters dated July 22d say that 1000 men had left Nome during the preceding two weeks for the placer district of Kougarok, a tributary of the Kusetreim river, which latter feeds a series of small lakes at the head of Grantley harbor, Port Clarence. All that interior country is a chain of rivers and creeks.

One hundred and fifty miners have been arrested at Topkuk after a clash with the soldiers, who charged the miners with fixed bayonets. The arrested men are under guard by soldiers, who have sent for additional help and a Government vessel. The whole of the Topkuk region is reported in a turmoil. The trouble arose over the tundra claims owned by the Alaska Commercial Co. The miners claimed that they were part of the beach diggings, overpowered the civilian guards and went to work on the disputed ground. The soldiers ordered the men off. They went, but immediately returned. The soldiers were again called out, but the miners refused to go, when they were arrested.

ARIZONA.

COCHISE COUNTY.

The Black Diamond group of claims in the Dragoon mountains is reported sold for $40,000 to C. J. Faulkner, W. Kellog and J. T. Devine of Washington, D. C., N. O. Bagge and J. A. Bain of New York, who have formed the Black Diamond Copper Co. to develop the group. They talk of a branch road to connect the Southern Pacific, 18 miles.

A copper group and extensions in the Dragoons, formerly owned by Bryant & Casey, have been bonded for $100,000 to W. H. McKittrick of California and Ryan Bros. Cattle Co., Arizona.

It is understood that the Commonwealth Co. will have their new mill up at Pearce and 100 stamps pounding by Jan. 1, 1901. The insurance has been adjusted and the debris cleared away.

F. Fenner, Supt. Lowell and Arizona, is putting in new machinery. The shaft will be sunk to a depth of 1000 feet.

GILA COUNTY.

At the Black Warrior mine, near Globe, owned principally by J. A. Fleming, the leasing plant is completed a month and is in operation by the leaching process—the largest leacher in that country.

MARICOPA COUNTY.

The Octopus group of mines near Wickenburg is reported bonded by J. L. Dougherty to A. A. Wadsworth for $100,000.

MOJAVE COUNTY.

The Connor-Minnesota mines are reported sold by J. Barry to the Wallapai M. Co. of Chloride. Included in this sale was a 100-ton concentrator, steam hoist, buildings and equipments. The purchasers are Los Angeles men. The sale was made through E. T. Loy.

At Kingman the deep pay chute on the Midnight is to be worked by leasers till Jan. 1, 1901.

Supt. H. B. Clifford of the Dragoon M. Co. is working fifty men at Johnsonville.

Kingman Miner: Recently a cave in the 110-foot level of the Merrimac mine, at Chloride, exposed a large body of rich ore. At the 250-foot level a bulkhead has been removed and the ore was found to extend to that level. This gives the Merrimac Co. nearly 200 feet of stoping ground.

The Tennessee mine at Chloride is to resume operations on a larger scale. More men will be put on and the ground between the 400 and 500 levels exploited.

PIMA COUNTY.

D. Allen of Washington Camp is reported about to close the sale for his Pool group of mines for $100,000.

The Helvetia copper mine, near Tucson, controlled by Calumet & Hecla people, is reported to be in copper ore, some of it native copper; the deposits average 15%. It is stated that the capacity of the furnace will be increased to 300 tons. A branch from the Southern Pacific is to be built.

YAVAPAI COUNTY.

A. N. Bartholdi has sold his interest in the Bartholdi group for $5000 cash and 4000 shares of stock in the I. F. M. Co. of New York. The group is in the Black Canyon district, 8 miles south of Jerome. They are copper claims. The International Financial Co., incorporated in New York, is the purchaser. A branch of that company will operate under the name of the Verde King Copper Co.

CALIFORNIA.

AMADOR COUNTY.

Supt. Parks of the Kennedy and Eureka Con. mines, near Jackson, says that the exodus of miners from Amador has seriously interfered with development work in the mines of that county, and that the same condition of affairs exists in the mines of Calaveras and Tuolumne counties.

The Record at Sutter Creek reports that at the Fremont Consolidated Supt. Purrington is preparing foundations for new hoist and head gear.

At the Bunker Hill Consolidated Supt. Downs has the shaft unwatered and retimbered to a depth of 540 feet.

Supt. Pritchard is operating the Keystone mine.

Supt. Tregloan of the South Spring Hill expects to start up some stamps on good ore.

From the Lincoln mine forty tons of ore are daily hoisted from the 500-foot level and crushed at the South Spring Hill mill.

At the Wildman-Mahoney mines it is expected that the east or Emerson shaft will be started again, that a connection can be made with the lower levels.

At the Central Eureka mine Supt. Thomas has the new ten stamps operating by electric power furnished by the Standard Electric Co. on high-grade ore.

In the South Eureka a new steam hoist, built by Knight & Co., is now in position.

Supt. Truscott has the Oneida 60-stamp mill nearly finished. It is expected that part of the mill will be ready to start up this month.

In the Kennedy mine the east shaft is down nearly 1400 feet; sinking goes on at the rate of from 80 to 100 feet per month. The 40-stamp mill is crushing the usual amount of ore.

In the Gwin mine Supt. McClure has on the 1600-foot level a vein of 27 feet, averaging $10 per ton.

CALAVERAS COUNTY.

About thirty men are at work on the Melones dam at Horseshoe Bend, on the Stanislaus.

Five miles southeast of Valley Springs is the Slate Creek mine, owned by Colville & Co. There is a small stamp mill running. Along the vein are the Vote, Alex Brown and Eproson, Beckley, Tilford, Dean and other mines.

In the Ford shaft, retimbering from the 100-foot level to the surface is going on, preparatory to letting a contract for sinking 200 feet.

The water supply in the Utica Co.'s system is falling off rapidly. The snow has disappeared from the higher mountains, and little water is finding its way into the reservoirs. A large head is turned into the ditch from the Silver Valley reservoir; but the evaporation is great, and only a small percentage reaches Angels.

Near Angels the Ghost mine is unwatered and the shaft clear to a depth of 1000 feet. Wm. Bravin has charge.

The assessment on the Utica G. M. Co. of $501,625 has been reduced to $434,125. The assessment of the Royal Con. is reduced from $228,860 to $178,860.

EL DORADO COUNTY.

Drew, Cohn and Donnelly have men at work on the river bed mine at Salmon Falls, where that section of the river worked has been dammed.

The Two Channel M. Co. contemplates development work of the Wilton, near Josephine.

The Nugget says work has been suspended temporarily at the Gold Bug mine, near Georgetown.

The Kimble mine, south of Placerville, is employing thirty-one men. About 120 carloads of gravel are put through the mill during the ten hours it runs each day.

In the Mt. Pleasant mine, near Grizzly, the water is now below the 600-foot level. It is expected that the mine will be free of water by Sept. 10, when the new owners, Brown Bros. of Oleta, will begin thorough exploration.

J. H. Bradley, Supt. Omo mine, says the 10-stamp mill started up this week.

W. H. Martin has sold to A. Hayward the Superior mine at Placerville for $15,000.

HUMBOLDT COUNTY.

The Blue Lakes Advocate says: "The Orleans Bar G. M. Co. have commenced mining in earnest."

The Crescent City News says the Orleans Bar G. M. Co. has brought the water onto the bar 12 miles in a 5-foot flume, at a cost of $50,000. The mine is in operation with 800 inches of water and can be run all summer.

INYO COUNTY.

The Ballarat G. M. Co. has incorporated in Salt Lake City, Utah, $500,000 capital stock; C. M. Freed president, C. W. Freed vice-president, L. D. Freed treasurer, G. H. Lowenstein secretary. Work on the property will soon begin. It was sold for $50,000 to the company by P. J. Ginser, the locator. A mill run gave $280 from ten tons. The company projects building a 20-stamp mill.

F. Mathews reports that to avoid delay 250 pounds of powder was taken by his party into camp, but the entire lot exploded, leaving them without any combustibles to work with.

Inyo Independent: Last week Cooper's little 4-stamp mill in Pleasant canyon, near Ballarat, yielded a cleanup of 3¾ pounds gold bullion from the owner's mine. The fineness of the bar is remarkable, being worth $18.50 per ounce, but the shipment before assayed at the rate of $19 per ounce.

KERN COUNTY.

Near Bakersfield the San Joaquin Company has ordered a steel storage tank, 97 feet in diameter, 30 feet deep, to hold 37,000 barrels.

LOS ANGELES COUNTY.

The Temescal ranch of 14,000 acres, situated partly in Ventura and partly in Los Angeles counties, has been bought by Los Angeles oil men for $400,000, and drilling for oil will be begun as soon as possible. The land adjoins the holdings of the Modello Oil Co., controlled by the Crockers.

MARIPOSA COUNTY.

L. E. Aubury of Los Angeles is operating the Roma and Sierra Rica mines on Bear Creek.

MONO COUNTY.

A. J. McCone has a contract for construction of a stamp mill at Lundy.

NEVADA COUNTY.

In the Erie mine, Eureka district, forty men are now employed by Supt. Turner at Graniteville. The new 20-stamp mill is approaching completion under the direction of G. A. Nihell.

PLACER COUNTY.

The Prairie Flower quartz mine at Canada Hill has a 5-stamp mill running steadily. Twenty men are employed.

A plan for the reorganization of the Pioneer G. M. Co. has been agreed upon by the directors—the same as that upon which the stockholders voted at Helena, Mont., May 31st, except that it provides that 20 cents instead of 25 cents be paid by present stockholders for having the stock of the present company exchanged into the stock of the new and that 30 cents more may be called later.

Colfax Sentinel: W. Muir, Turkey Hill mine, Michigan Bluff, has thirty men at work in the old Weske channel, and men are developing the Sacramento mine at Forest Hill.

PLUMAS COUNTY.

Near Johnsville the Jamison M. Co. is employing fifty men in the mill and mine. About the same number are employed at the Four Hills mine, 6 miles from Johnsville. The 10-stamp mill on this property is running steadily. The owners propose to erect a larger mill.

F. F. Vanzini, at the Eureka mine, has fifteen men at work extracting and milling ore.

At La Porte, Manager Holgate of the Dutch mine has taken charge. The Thistle Shaft Co. is boring on the property.

J. Rosenthal has bought copper mining properties on the North Fork of Feather river, near Meadow View, from McMillan & Boyden.

SANTA BARBARA COUNTY.

The Fithian ranch, Carpenteria, 3000 acres, has been leased for oil by the Northern Con. Co., who have erected a 75-foot derrick. The hole will be started with 11-inch casing and will be sunk 2000 feet.

The Santa Barbara Herald asks that this shall be believed: "The people of the Oxnard Oil Co. at Summerland had an oil well completed for the pump last December. Up to a month ago it pumped well. At that time it was sand pumped, but when there was an attempt made to pump again it was found that the well had commenced to flow, and that the production by the natural method was greater than by the pump. The oil does not run out of the casing in a steady stream, but comes in jerks, just like the flows of a pumped well. The tide of the oil ebbs and flows with the same rhythm as the tides of the pumped wells near by."

SHASTA COUNTY.

In the Bully Hill the ore body has been found in the lower tunnel, in 1100 feet, 50 feet less than was expected.

Austin H. Brown, Supt. at Bully Hill, expects part of the new machinery by Sept. 1. The copper smelter will have a capacity of 2000 tons per day.

SIERRA COUNTY.

Work has begun on a ditch from the Middle Fork of the North Yuba to Downieville for supplying mining companies.

SISKIYOU COUNTY.

The Black Bluffs mine, Fool's Paradise mining district, 10 miles north of Yreka, has been sold to Baker & Jewett, owners of the Cherry Hill mine.

Grant, Taggart & Dennison, at Salmon Summit, have twelve men at work on the Yellow Cat. The ledge ranges from 1 to 4 feet in width and assays $30. They are getting in machinery.

The dredger in Yreka creek at Hawkinsville is lifting gravel from bedrock, 30 feet below the surface. Large boulders are broken with giant powder.

The Searchlight says the DeLamar smelter, at Bully Hill, will be completed Jan. 1, 1901.

STANISLAUS COUNTY.

Near Grayson, E. P. Newhall is developing a quicksilver property; on the Summit quicksilver mine, on Red mountain, Adobe valley, he has a double track tunnel in 600 feet. He is said to be backed by Alvinza Hayward. It is believed that big mines will eventually be developed.

TRINITY COUNTY.

Mineral Wealth considers the Chloride-Bailey mine of Dedrick, on Canyon creek, 14 miles above Junction City, the most promising quartz mine of the county. The group comprises twenty-six claims, besides 160 acres of placer ground on Snowslide gulch, which will constitute the future millsite of the mine. The principal work has been done on the Chloride proper; sinking goes on from the 660-foot point, to be continued for 1000 feet with drifts every 100 feet. Three eight-hour shifts are worked.

The Wallace & Mahoney placer mine has operated nine seasons under the present ownership, a half acre being worked away per year. It yields upwards of $20,000 per acre, but is an expensive mine to work on account of the big boulders encountered. The powder bill the past season was $2000.

On the East Fork of the North Fork of the Trinity at the Lone Jack, owned by Day Bros. & Balch, a $10,000 tunnel is being driven through hard rock; it has half its length, 300 feet, still to run.

The Yellowstone is being developed by its owner—R. A. Skinner. The last big run turned out $7700 from 700 tons. Some low-grade rock—$3 to $5—is still in the stopes.

TUOLUMNE COUNTY.

J. J. Lawrence is the new Supt. of the Crystalline mine, near Jamestown. He has men grading for the new double-compartment vertical shaft.

Magnet: Acting under instructions received from London, Supt. Gerrans discharged the men employed at the Tarantula mine and closed down operations.

The shaft at the Bown mine is down 650 feet.

The machinery is being taken out of the Lady Washington mine, Carters.

At the Pompey mine, 4 miles west of Rawhide, the shaft is down 160 feet.

Near Jacksonville the 10-stamp Mammoth mill is running twenty-five tons from the Republican mine daily.

Work is to be resumed upon the Willette mine.

The machinery is set up in the new mill at the Clio mine. The hoist is completed. E. Fitzgerald has been appointed foreman.

Peterson, Conlin & Pownall have finished a survey for a 900-foot tunnel into Bald mountain, west of the Hilton & McPherson mine, to tap the Over property.

The Sonora Independent says the Bonita mine, north of the Providence, owned by Chas. Fair, will start operations.

COLORADO.

CLEAR CREEK COUNTY.

Near Idaho Springs the Kokomo mine on Seaton mountain has 3 feet of ore that runs $150 per ton. Forty men are employed; the mine ships a car of 25 tons a day to the mill at Dumont.

CUSTER COUNTY.

(Special Correspondence).—The Hermet Lake Copper M. Co. have recently equipped their property with machinery for mining and milling. It is situated

The following table gives the gold, silver, lead and copper production of Colorado during 1899, as compiled by Harry A. Lee, commissioner of mines for Colorado:

County.	Gold value.	Silver (coinage value).	Lead value.	Copper value.	Total value.

about 11 miles from Silver Cliff, in the Sangre de Christo range. The water supply is from Hermet lake, and is conveyed to the mine and mill through an 11-inch pipe line, 2700 feet iong. The mine is opened through a tunnel 350 feet long, which cuts the vein at right angles. The ore is transported from mine to mill over a gravity tramcar line. The mill has a capacity of sixty tons per day, having twenty stamps, a 10x22-inch Blake crusher, four Frue and four American concentrators, all of which are operated by a 24-inch Hug wheel, under 400 feet pressure. The ore is a native copper, contained in red trap rock. This property is owned by Boston people and is under the management of W. J. and W. S. Elmendorf. The equipment was supplied by the Hendrie & Bolthoff Mfg. & Supply Co., and was set up and buildings erected under the direction of W. C. Stanley of Denver.

Silver Cliff, July 27.

DOLORES COUNTY.

At Rico the old milling plant will be fitted up with machinery for the treatment of zinc ores.

Later advices say that the New Jersey Zinc Co., working the Atlantic Cable group, has abandoned the property, believing the ore is not rich enough to warrant a mill. Manager Dwyer has gone to Leadville. The owners of the property claim that the zinc ore from the Cable property has been found better than was expected.

EAGLE COUNTY.

The town of Gilman, of 600 inhabitants, and the center of the mining industry of the county, was destroyed by fire on the 1st inst.

FREMONT COUNTY.

W. B. Milliken, manager Union Construction Works, Florence, says the new plant will start up about Sept. 1 with a capacity of 250 tons per day.

The Florence M. & R. Co., a new corporation, with a lease on the Cripple Creek Beam M. Co.'s plant at Florence, is making extensive improvements on the property. It is being changed from an amalgamation and concentration plant into a concentration and cyanide mill. This mill was built several years ago, but was not successfully managed, and $50,000 worth of machinery has been standing idle for some time.

GILPIN COUNTY.

(Special Correspondence).—An electric locomotive will soon be in use transporting ore from the lower levels of the Cook mine, through the Bobtail and Bates Hill tunnels, to the Boston & Denver mill at Blackhawk.

The Jennie Blanche, at the mouth of Four-mile canyon, will be developed by a company of lessees of Denver.

The National mine, on Quartz hill, near Central City, is now under bond and lease to H. P. Lowe of Denver. The National shaft, 400 feet deep, is half full of water. It will be unwatered and sunk to 600 feet depth.

Jenkins, Lightborn & Co. are operating the Peterson 15-stamp mill in Lump gulch and the Daisy mill at Perigo. Both run on the ores from the Gold Dirt mine.

Central City, July 29.

The Gilpin G. B. P. & M. Co. has organized, capital stock $100,000, at Central City, to placer North Clear creek.

The Gilpin & Boston G. M. Co. sent eight tons of tailings, the product of eight cords of ore, to the Gilpin mill at Black Hawk, which sold for $28 per ton. The ore cleaned up three ounces gold per cord on plates.

GRAND COUNTY.

(Special Correspondence).—The Copper Chief has been purchased by E. J. Hagerman of Colorado Springs and F. Whipp of Cripple Creek, who have a force of ten men at work developing the property. A shipment of fifty tons of ore was made which ran as high as 40% copper. Other shipments are to be made soon.

Sulphur Springs, July 27.

LAKE COUNTY.

At Leadville men are buying lots in the city limits to locate mining work.

The Penrose shaft of the Home M. Co. will be sunk a farther distance of 80 feet.

The Carbonate Chronicle says several hundred tons of manganese daily are moving from Leadville to the Illinois Steel Works.

The Leadville News-Reporter says that development work on the Big Six mine has produced ore carrying high in gold, rich in lead and iron and running 1000 ounces in silver.

SAN JUAN COUNTY.

The change from rolls to stamps in the Sunnyside mill in Eureka gulch has been completed. The mill is operated by water power and with the old mill, a short distance above, 125 tons of rock are treated daily. The pulp passes from the stamps to Bartlett tables, the fines being subsequently treated on Wilfleys and then on canvas, and the extraction is so satisfactory that Judge Terry is now making arrangements for an addition of twenty stamps, which will give the united plants a daily capacity of 200 tons.

SAN MIGUEL COUNTY.

(Special Correspondence).—The San Bernardo has been leased to H. M. Hogg of Telluride, who proposes to so develop it as to be able soon to resume shipments. This property has a good record as a producer and has been noted for its high grade ore.

The Bessie, Gold King, Alta and Four Metals, located in Turkey Creek and Gold King basins, are all active and together employ about 200 men.

The Wild Flower, in Swamp canyon, is to be vigorously worked. A 2-foot ledge of ore has developed, carrying good values in silver and gold.

The Bullion mill, under lease to J. Real, started three weeks ago, after having been improved some. It is run as a custom mill and is said to be well patronized.

Telluride, July 29.

The Butterfly group, Ophir district, is reported being operated, the ore bodies improving in size and value. A recent clean-up, after a nine days' run, netted $1451, and $430 concentrates.

The Tom Boy mill is reported turning out $50,000 in gold per month; 200 tons are crushed daily, the values are saved on the copper plates, scraped off and smelted into gold bricks for shipment. The hoist capacity from 400 to 500 tons daily from a depth of 500 feet is in operation, and the three-compartment shaft being sunk from the mill tunnel level is going down now about 300 feet from that level. The company is also developing the Argentine and Red Cloud group of claims on a vein running parallel to the Tom Boy.

By Nov. 1 it is thought that the Pennsylvania tunnel will have cut the Smuggler-Union lead 700 feet below the present lowest workings of the Smuggler-Union mines. The distance from the mouth of the Pennsylvania tunnel to the intersection of the Smuggler vein is about 3500 feet. A new tramway will be built from the mouth of the Pennsylvania tunnel to the Smuggler-Union mills and shipping station at Pandora, about three-quarters of a mile.

TELLER COUNTY.

(Special Correspondence).—A reorganization of the Anaconda M. Co. was effected on July 25th, at a meeting of stockholders in Denver, at which 306 stockholders were either present in person or represented by proxy, representing 756,563 of the 1,000,000 shares. The company is organized under a new charter, with a stock issue of 2,000,000 shares of the par value of $1 each, the new corporate name being the Anaconda Con. M. Co., which takes over the property and assets of the old company, paying the indebtedness of the latter, amounting to $125,000. The stockholders of the old company are paid for their stock, share for share, in stock of the new concern. A. J. Zang was made president; J. T. Milliken, vice-president; F. J. Campbell, secretary and general manager; A. E. Carlton, treasurer; all of whom are directors, with the addition of D. Rubidge, W. B. Milliken and F. S. Sigel. After paying the indebtedness, there remains in the treasury 500,000 shares of stock, worth over $200,000. Manager Campbell is and has been for the past two years manager of the Vindicator mine in this district.

Cripple Creek, July 27.

(Special Correspondence).—The inauguration of proceedings on the part of the general Government to set aside a patent issued to the Independence Town & M. Co. for mineral grounds at Independence, Cripple Creek district, previously mentioned in these columns, was the outgrowth of charges of fraud preferred by the Wilson Creek Co. in its contest for the grounds in question. In the absence of any reports of progress by the Government in prosecuting the case for cancellation of patent, there are extant what appears to be authentic announcement of a consolidation of the Independence and Wilson Creek companies, who have fought each other so bitterly for seven years; or that the Wilson Creek management has purchased the control of the Independence. Just what will be done as to the charges of fraud, on which the Attorney General of the United States bases the suit for cancellation of patent, has not been explained. The property is among the most valuable in the district, and it is not to be questioned that it will soon be operated by somebody.

Victor, July 28.

(Special Correspondence).—W. A. Baldwin, trustee, has purchased the New Zealand lodes, with a portion of the Favorite, Mollie Maguire, Zenobia and Hidden Treasure, all contiguous, located on the summit of Bull hill, the price named being $255,000. The sale was made by F. M. Woods of the Woods Investment Co., acting for the Magnolia and New Zealand G. M. companies. It is surmised that Mr. Baldwin was acting for W. S. Stratton, who owns an extensive area of ground in that locality. The effect of the sale is to dispose of litigation involving some of the groups.

The Zoe G. M. Co. has been organized, to further develop and operate the property on a three-acre tract on the Ariqua townsite, which is said to have produced $100,000 within the past year. M. Kinney of Colorado Springs is at the head of the company. A new plant of machinery is being put in.

Willard, Miller & Co., who have a lease on the Abe Lincoln, on Raven hill, have opened a 2½-foot ledge of ore at 220 feet depth, which assays as high as $40 per ton. Hoisting machinery is being put in and further work will be pushed.

Victor, July 28.

The company organized by W. S. Stratton to operate his various Cripple Creek properties, acquired by him during the past nine months, is styled the Cripple Creek Mining & Development Co., capital $10,000,000, incorporated under the laws of Wyoming, W. S. Stratton, W. A. Ramsay, W. A. Baldwin, J. H. Emerson and D. H. Rice directors for the first year. The purpose of the company is to mine and operate in the Cripple Creek district.

Supt. Camp of the Elkton Con. Co. is putting in new engine, boiler, compressor, a hoist, steel gallows-frame, large engine house, pump, etc. The engine will be 20x48, with 12-foot double reels, carrying 2000 feet of cable. The gallows-frame will be the second one in the district built of steel, the Hull City people having the other, and will be 55 feet high to the sheave. The pump has a capacity of 1000 gallons a minute; a straight lift of 800 feet is being installed. The output is about 1000 tons a month.

F. M. Woods, acting for the New Zealand G. M. Co. and the Magnolia G. M. Co., has sold to W. A. Baldwin, trustee for W. S. Stratton, the O. K. and New Zealand lodes and portions of the Favorite, Mollie Maguire, Zenobia and Hidden Treasure claims for $225,000.

The Buckhorn G. M. Co. has sold the Whip-poor-will claim of 2½ acres to E. S. Johnson for $15,000. A bond and lease had been given by former officers of the company for $20,000. It had nearly two years to run. The company thought it better to take the $15,000 cash offer than to wait.

It is locally said that a compromise has been effected between the Wilson Creek Co. and the Independence T. & M. Co.

Stratton's Independence is now reported to have disclosed the existence of flat veins between the third and fourth levels, running across the vertical veins; from 3 to 4 feet of the matter is being shipped. It is said to run five ounces gold per ton. For the week ending July 19th there were shipped from the mine 210 tons of ore, gross value $85,625.

The Anaconda G. M. Co. will reorganize with a capital stock of 2,000,000 shares, the new company to take over the property and all the holdings of the old company, the stockholders of the old receive share of the new for share of the old, the debt of $125,000 to be paid by those interested in the reorganization. The plan for the development of the property has not as yet been fully decided upon. It is the intention to sink a 600-foot shaft and lease all the ground to a depth of 200 feet.

The Independence T. & M. Co. and the Wilson Creek Con. M. & M. Co. have consolidated, and the suit which has been authorized by the Secretary of the Interior to annul the patent issued to the Independence Co. will be called off. The Wilson Creek Co. was the complainant.

IDAHO.

BOISE COUNTY.

The Middleman mine at Pearl, owned by Dorman, Tipton and associates, is reported sold to a New York company, represented by W. L. Gross. The condition of the sale is for one-half of the mine. The development under the bond calls for the sinking of the present shaft 200 feet deeper and cross-cutting and drifting upon the ledge 100 feet. As soon as the hoist is in place the new operators will prepare for extraction and shipping of ore.

From the Checkmate mine ore is being shipped.

BLAINE COUNTY.

W. F. Olsen of the Ætna M. Co. at Salt Lake City, Utah, regarding the property at Hailey, Idaho, tells the Tribune that the new tunnel driven on the strike of the vein shows good ore.

Near Hailey there is an effort to reopen some of the old silver-lead mines, such as the Minnie Moore.

In the Hailey gold belt the ore is a copper sulphide. The deepest workings are at the Tiptop and the Crœsus, about 400 feet. The former proposes to sink the shaft to a depth of 1000 feet. The Tiptop has a 20-stamp mill, the Crœsus a 10-stamp mill.

Scranton, Pa., men have bonded the Maryland Con. and will have men at work excavating for a 10-stamp mill.

CANYON COUNTY.

C. S. Crossman has his gold-saving machine at Bridge island, 2 miles west of Parma. He has eight men at work, running two shifts at a cost of $1.50 per hour, handling 1500 cubic feet every twenty-four hours. He uses the gravity system and says he saves 80% of the values before the gold gets to the burlaps. He has a liquid preparation that he has patented, through which the remaining 20%, together with the black sand, passes over a burlap table 60 inches wide, with about 2 inches of water, to another table 1200 inches in width. All the black sand and the small particles of gold that are coated with silica are treated to a mercury bath which is kept constantly in motion until it will amalgamate.

IDAHO COUNTY.

Grangeville states that the Buffalo Hump syndicate has expended $500,000 in the purchase and development of its holdings. It has 120 men at work on the wagon road from Badger to the Hump and the road is ready for the hauling of machinery. At Callendar, where the syndicate is operating, a 40-stamp mill is to crush the ore of the Big Buffalo lead. The mill is being so constructed that sixty additional stamps can be easily added. It is proposed to have a 100-stamp mill in operation next winter. On the Big Buffalo there are thirty-five men at work and three eight-hour shifts running. The three-compartment shaft is 125 feet deep. The new hoisting plant on the Big Buffalo will be of 40 H. P. and of sufficient capacity to sink the main compartment shaft 500 feet.

NEZ PERCE COUNTY.

Lewiston reports that A. Arnold, owner of the Fleetwood mine, has in his incline shaft a ledge from 8 to 20 inches showing $25 free milling gold ore.

SHOSHONE COUNTY.

The Morning M. Co. at Mullan, and the Empire State-Idaho M. & D. Co. at Wardner, are each running a 2-mile tunnel. The Bunker Hill & Sullivan Co. is also boring a 2-mile tunnel, now nearing completion. East of the Bunker Hill in the Alhambra a tunnel 1700 feet long is being run.

The Chester M. Co., Ltd., has incorporated at Wallace; Wardner is the principal place of business; capital stock, $25,000.

MONTANA.

CHOTEAU COUNTY.

The Mission Peak M. Co., which operates in the Little Rockies, has a bond on the Gold Bug and Gold Boy group of free milling gold mines, and will put in a stamp mill and work the tailings by the cyanide process, using steam power for the machinery. They have lignite coal within 6 miles of their millsite. They plan to dam Rock creek canyon at a convenient point above the town of Landusky. The mines are developed by about 1400 feet of shaft and tunnel.

DEER LODGE COUNTY.

F. C. Wood of the Garnet M. Co., of Pony, will install a gasoline hoist to sink the shaft to a depth of 500 feet. E. L. Ballou will have charge of the mill.

FLATHEAD COUNTY.

W. J. Beager, manager American Kootenai M. Co., on the West Fisher, will build a tram 2500 feet long, the ore to be delivered from the mine to the mill by eight buckets. The company has twenty-six men at work.

H. T. Vaughn tells the Libby News that he has a ditch ¾ mile long from Libby creek to this gravel bar, which is about 100 feet deep, and will operate it.

GRANITE COUNTY.

The Shamrock mine at Garnet, owned by McDermott & Lannon, has been leased and bonded for $60,000 by W. H. Godfrey of Butte. Mr. Godfrey has made a cash payment of $5000 and took the property over Aug. 1.

JEFFERSON COUNTY.

The Elkhorn Queen is shipping forty tons per day to the East Helena smelter.

B. Leyson, Supt. Mayflower mine, near Whitehall, says that the Mayflower now lacks 20 feet of being 1000 feet in depth, or about 75 feet below the bed of the Jefferson river.

LEWIS AND CLARKE COUNTY.

On the 1st inst. the Montana M. Co., limited, closed down the Drumlummon mine at Marysville. The 110 stamps of the company's mills have been hung up and there is no ore in the bins. Fifty men will be employed for some time prospecting the mine, and if they uncover new ore bodies operations will be again resumed. There is every indication that the shut-down will be a long one. The Drumlummon was a famous gold mine in Montana. It was located in 1879 by T. Cruse of Helena, now a millionaire, but then so poor he could not get credit for a sack of flour. He sold his mine to English men for $1,000,000. The mine has since earned many millions for its owners. It once employed 700 men.

In the Rimini district machinery is in place on the Mettie to sink 200 feet.

Shipments of tailings from the Golden Gate mine at Rimini to the Peck concentrator have been suspended.

In the Piegan at Marysville ore which assays $350 per ton in gold is reported.

MADISON COUNTY.

The annual income returns of the leading Montana copper companies are given as follows: Parrot, 14.29%; Boston & Montana, 13.20%; Anaconda, 9.30%, and Amalgamated, 9.09%.

MEAGHER COUNTY.

Reynolds & McDowell have bought the Copperopolis group of mining claims, 16 miles from White Sulphur Springs, for $50,000 cash. The group comprises the Northern Pacific, St. John's and Darling Fraction claims. The ore is copper glance.

There are seventy-five men working; the number is to be increased.

MISSOULA COUNTY.

At the Carlan placers, east of Missoula, near Carlan station, on the N. P. road, examination shows sufficient gold in the gravel to pay. Proposed machinery will comprise a pump to lift the water from the Missoula river, flumes and giants. The ground is sand and small gravel, few boulders of any size being found. It can be worked for 10 cents a yard. Pay dirt will average 15 cents a yard.

SILVER BOW COUNTY.

The following statements are for the year ending June 1, 1900:

Anaconda Co.—Mines operated: Anaconda, Mountain Con., Green Mountain, Bell and sampling works.

Tons of ore extracted	1,421,500
Gross value, per ton	$13 18
Cost of extraction, per ton	4 38
Total cost of extraction	6,228,655 25
Cost of transportation (27 miles), per ton	21
Total cost of transportation	300,031 58
Cost of reduction, per ton	3 77
Total cost of reduction	5,354,145 79
Paid for labor	5,878,851 47
Paid for machinery and supplies	5,703,949 57
Freight	300,031 58
Marketing products	1,481,780 73
Net proceeds	5,365,518 15

Recapitulation:

Gross proceeds	18,730,131 50
Cost of mining	6,228,655 25
Freight on ore	300,031 58
Cost of reduction	5,354,145 79
Selling and marketing	1,481,780 73
Net proceeds	5,365,518 15

Butte & Boston Co.

	Blue Jay.	Other mines.
Tons of ore extracted	31,104	122,372
Gross yield, per ton	$14 61	$14 61
Cost of extraction, per ton	4 86	6 19
Total cost of extraction	151,244 70	750,567 31
Cost of transportation, per ton.	22	22½
Total cost of transportation.	6,959 94	27,382 82
Cost of reduction, per ton	3 59	3 59
Total cost of reduction	111,659 77	439,331 98

Tons of ore extracted	2,068
Gross yield, per ton	$8 93
Cost per ton for extracting	3 76
Total cost of extracting	778,800 00
Transportation per ton (2 miles)	30½
Total for transportation	63,112 00
Cost of reduction, per ton	3 29
Total cost of reduction	681,445 00
Paid for labor	481,234 00
Supplies	297,566 00
Net proceeds	325,044 00

The Alice G. & S. M. Co.'s principal mine is the Alice, in Walkerville, formerly a producer of silver. The report for the fiscal year ending June 1st, 1900, shows that during the year the company mined and milled 6945 tons of ore, which yielded 132,134 ounces of silver, valued at $75,316.38, the product having been sold at an average of 57 cents an ounce. The same ore yielded $8114.63 in gold. The company also sold 5228 tons of ore for $107,541.32, making the total receipts $190,972.33. The company states that the operating expenses and the total cost of producing the 12,173 tons of ore was $206,544.66, making a loss in operation of $15,572.33.

The report of Receiver Harris of his operations of the Snohomish and Tramway mines shows that during June there was mined a total of 2195 tons of ore from the Snohomish and 105 from the Tramway. The total cash in bank July 16 was $106,077.75. In his report Mr. Harris says: "During the month covered by this report no mining operations have been carried on in the Tramway mine by the receiver. A portion of said mining claim is under lease to the Messrs. Bortoglio & Co. and they produced for the month 105 tons of ore at a profit to the receiver of $398.56. During the first four days of the month the Snohomish produced 320 tons of ore, of which Mr. Heinze received and hoisted 160 tons, the share of the receiver being $711.01. During the remainder of the month the ore production from said Snohomish mine was 2034 tons, for which the receiver received $9028.98."

The Inter-Mountain, Butte, says the experimental plant erected by Mr. Peck of the Peck concentrating process has been shut down, the men discharged and with no date fixed for the resumption of work. The plant is similar to that which was attempted at Park City, Utah, and which continues idle.

NEVADA.

CHURCHILL COUNTY.

All of the material for the smelting plant at Cottonwood has been delivered.

ELKO COUNTY.

The announcement that the mill on the Young America at Tuscarora has been closed down is looked upon in Salt Lake City as being amusing. A shareholder there tells the Tribune that he had never had anything to convince him that the plant had ever started up, notwithstanding the fact that the machinery for it was contracted for more than a year ago.

LANDER COUNTY.

A road has been opened to the antimony mines 7 miles south of Austin, and the extraction of ore has begun.

LINCOLN COUNTY.

At Searchlight at the Quartette Co. mines, the McReady group are making necessary connections, putting in the 250-foot level; the gasoline engine is working well. At the Dunn's group the steam hoist is in place.

LYON COUNTY.

Test runs of the cyanide process on the ore tailings from the Hulley-Logan mine at Como make it probable that the bullion value of the ore can nearly all be recovered through cyaniding.

STOREY COUNTY.

The electric power line is about completed to its terminus on the Comstock lode. It extends from the generator to the sub-station at the C. & C. mine.

Work has been started on the 425 level of the Savage.

J. R. Ryan telegraphs from Virginia City, under date of the 2nd: "At 6:30 this morning the water was 184 feet 5 inches below the 1950-foot level station. No. 1 elevator has been running continuously."

WHITE PINE COUNTY.

D. W. Smith, of Elmira, N. Y., has bought the Chainman group at Ely for $100,000.

The Glasgow & Western Co. has advanced the wages of the miners working in the Star shaft; work is being pushed.

NEW MEXICO.

GRANT COUNTY.

The Pinos Altos G. M. Co. is taking out ore from the Gillett shaft and handling the product in the concentrating mill. The average force in the mine and mill is 125 men. The mill is handling 100 tons of ore daily.

LINCOLN COUNTY.

About 100 miners are employed at White Oaks. The Homestake at White Oaks has 200 tons of ore on the dump.

The Old Abe has a 20-stamp mill. A cyanide plant is also at the mine. Every level of the mine, which is 1200 feet deep, is dry.

SIERRA COUNTY.

The Grandview M. Co. of St. Louis, Mo., has its headquarters at Kingston, D. Bowman agent. The company has the Grandview group of mines, Carpenter district, in the Black range, 8 miles from Kingston, and has bought the water rights and site for milling purposes of the Mimbres Hot Springs. The mines and the mill will be connected by tramway.

TAOS COUNTY.

The Rio Hondo Copper Co., purchaser of the Fraser property, is working three shifts and building more houses.

OREGON.

BAKER COUNTY.

The Sumpter smelter is in readiness for operation. Manager Laughlin says all that is now needed to make it a success is a supply of ore sufficient to keep it going.

JACKSON COUNTY.

The Swayne M. Co. will resume operations at its mines at Applegate. W. D. O'Brien will be in charge.

JOSEPHINE COUNTY.

A San Francisco company has 300 acres of land 3 miles from Gold Hill and will test the efficiency of their dry-washing process. The John L. Ferris Co. has 600 acres of land for dredging purposes in the vicinity and will place dredgers in ponds dug therefor.

The dredger at Waldo has been shut down.

Ganguish & O'Neil are erecting a 5-stamp quartz mill on their property at the mouth of Palmer creek.

The Gold Standard mine on Jackson creek is shipping concentrates to the Selby smelter.

LANE COUNTY.

The Black Butte quicksilver mines, 18 miles south of Cottage Grove, are operating; W. B. Dennis has charge, working fifty men; the reduction works are running.

SOUTH DAKOTA.

LAWRENCE COUNTY.

At Lead the Homestake M. Co. will soon have two more stamp mills in operation, which will give the total number of stamps dropping 950—the largest number of any gold mining property in the United States. The company is also building a 1000-ton cyanide plant and putting in a water ditch 14 miles long.

There are six cyanide mills now building in the vicinity of Deadwood.

UTAH.

JUAB COUNTY.

On the 1st inst. the whole of the Tintic mining district was shaken by earthquakes. The shaft of the Mammoth mine was twisted so it was impossible to get the cage below the 1600-foot level.

The Utah mine, Fish Springs, Deep Creek country, last week sent to Salt Lake a carload of ore which was settled for on a basis of $120 per ton net. The controls on which the ores were marketed showed 182 ounces silver and 50% lead per ton from the workings off the 500-foot level.

SALT LAKE COUNTY.

J. R. Tucker, Supt. American S. & R. Co.'s plants at Murray and Sandy, tells Tribune that the plants are now running at maximum capacity, with about 20,000 tons of ore going monthly through the furnaces, and that he has all the talent necessary with which to discharge the work.

The Last Chance M. Co. properties at Bingham are sold to L. H. Hogle of Chicago, for $75,000, by C. J. Hodge, of Houghton, Mich. The purchasers made a cash payment of $25,000. The Tribune hears that systematic work will commence at once and that the mill will be started up under experienced management.

SUMMIT COUNTY.

At Park City J. B. Weimer of Salt Lake is reported to have control of the tunnel projected by J. McGregor to be driven into the main ore-bearing zone from an opening in Nigger hollow.

Connection has been made on the 1400-foot level with the main ore bodies of the Daly-West at Park City.

TOOELE COUNTY.

It is expected that the consolidated Mercur and Golden Gate mines at Mercur will yield 1000 tons daily of $8 ore, to be treated at a cost of $4 per ton.

WASHINGTON.

FERRY COUNTY.

On Gold Hill, northeast of Republic, the Gold Ledge Con. M. & M. Co. has the claims of the Gold Ledge M. Co., the Gold Ledge Extension Co., and the Badger. H. L. Lilienthal is president and general manager.

It is expected in Republic that the Republic Reduction Co.'s plant will be in operation by Sept. 1.

FOREIGN.

BRITISH COLUMBIA.

Near Ymir the Kenneth M. & D. Co. is to construct a bromo-cyanide plant to treat the ores of the Tamarack mine. The development work on the mine recommenced last week.

At Kaslo C. Caldwell has bought the Pontiac and Tecumseh claims on Woodbury creek, Kootenay lake, for the Canadian Pacific M. Co., developing claims at the mouth of Woodbury creek. It is about to put in a $10,000 compressor and hoist.

Near Grand Forks two shifts are pushing development work on the Golden Eagle, Brown's camp, north fork of Kettle river, in charge of Supt. J. H. Fox.

The B. C. mine, Summit camp, will ship to the Grand Forks smelter, avoiding the long haul to Trail.

The Old Ironsides and Knob Hill mines at Phœnix have shipped seventy carloads of ore to the Grand Forks smelter.

S. H. C. Miner says that another furnace will be added to the Grand Forks smelter, increasing the capacity to 1000 tons daily. He expects to see $5 ore treated at a profit.

S. F. Parrish, manager B. C. mine, Summit camp, denies the report that the property had been sold to a syndicate of C. P. R. officials.

J. Trainer, Supt. Strawberry property, north fork of Kettle river, reports that the crosscut on the 100-foot level is 5 feet in ore. An upraise will be made from the lower level to connect with No. 2 shaft.

E. N. Fell, manager Athabasca, Nelson district, is arranging for a cyanide plant.

A cleanup of a small section of gravel at the Ward-Horsefly mine, Cariboo, realized gold values of $3000; this was preliminary to larger washes later in the season.

In Boundary Creek district, of which Greenwood is the business center, the Spokane Spokesman-Review summarizes the approximate number of men employed in connection with mining as follows:

Camp.	No. men.
Deadwood	120
Deadwood erecting smelter	50
Greenwood	200
Summit	20
Wellington	45
Central	45
Other camps	60
Total	540

The men employed as enumerated in the foregoing table are engaged wholly in the work of development.

Estimates of the capital invested in the mines of the camps so surrounding Greenwood is as follows:

Camps.	
Skylark and Providence	$ 195,000
Greenwood and Wellington	1,400,000
Central	520,000
Smith's	75,000
Deadwood	575,000
Copper and Kimberly	40,000
Long Lake	305,000
Summit	525,000
Greenwood and Grand Forks smelters	405,000
Total	$4,040,000

In nearly all cases with any depth the ore shows a general sameness of appearance—i. e., chalcopyrite, with hematite and some iron pyrites mixed with calcitic and some quartz in a greenish, eruptive rock, showing considerable alteration and sometimes having a schistose structure. In some cases the ore bodies along their trend are capped with magnetic iron oxide, through which is disseminated in varying quantities (though, as a rule, small percentages) copper pyrites. The ore bodies appear to occur in contact with lime and diorite, which have a general northerly and southerly trend and an easterly dip. Some of the ores are self-fluxing and all are adapted for smelting. The number of feet of development work done on the leading properties is as follows:

	Sinking and raising.	Drifting and crosscutting.	Total feet.
Old Ironsides	820	2,242	2,802
Knob Hill	528	2,581	3,089
Victoria	...	2,460	2,460
Grey Eagle	...	330	330
Brooklyn	340	1,710	2,050
Stemwinder	325	165	490
Idaho	50	...	50
Rawhide	...	400	400
Snowshoe	380	1,100	1,480
Gold Drop	395	1,510	1,905
War Eagle	242	190	432
Totals	2,880	12,868	15,548

With the exception of the Idaho and the Rawhide, all the above-named Greenwood camp properties are worked by power plants.

The Old Ironsides No. 2 shaft, now down 400 feet, is the deepest shaft in the district.

J. P. Graves, general manager Grand Forks smelter, has quoted rates to nearly every mining company in the Boundary. He has authority for the statement that he has offered to treat the ores from certain mines at a figure ranging between $3.50 and $4.50. This includes freight and treatment.

CANADA MINES.

The Ontario Government assay office at Belleville, Ont., writes: "An inquiry has been received for properties containing iron pyrites or mundic located near railway shipping facilities, from the Mines Contract & Investigating Co., Toronto. Pyrites are used for the manufacture of sulphurous dioxide gas, used extensively in bleaching wood pulp and paper, also for manufacture of sulphuric acid. In this connection it is worthy of note that several attempts have been made to ship iron pyrites from deposits in eastern Ontario, but the excessive freight rates consumed all profits. The Laurentian Pulp Co. of Three Rivers, Quebec, making wood pulp and paper by the sulphite process, advises the erection of small roasting furnaces at the mines, and the shipping of the condensed and liquefied sulphurous acid gas in cast iron cylinders."

LOWER CALIFORNIA.

I. I. Irwin, of San Diego, Cal., is now the sole owner of the properties of both the Republica and Fortuna M. Cos. in Lower California. The mines are located in two different districts in that portion of the peninsula, 50 miles back of Ensenada.

MEXICO.

(Special Correspondence).—There are in the dumps of the Mina Grande, Tajitos and Quezadena mines, in the mining district of Tatepuzco, Ahuacatlan, Tepic, more than 4000 cargas of 138 kilos each, of ore averaging from 4 to 5 ozs. per carga (30 ozs. silver per ton). The ore is a concentrating ore, and a 3-stamp mill with a crusher and a concentrator can easily operate during seven months of the year with water power and five months with a steam 10 H. P.

There is an old hacienda de beneficio (amalgamation process) which can be repaired with $1000, Mexican. Reduction of the ores may be calculated in 200 cargas of 138 kilos each.

The mines of Acuitapilco, called El Mozquite, Trinidad, Catarina, Buenavista and Todos Santos, were worked with success by the old Spaniards and later by miners from Guadalajara. One of those mines, the Valenciana, is being developed by an American company. A 3-stamp mill, a crusher and a concentrator will be soon in place. Fifty men are employed at Acuitapilco. The high-grade ore is being sent to the reduction works of Lonergan & Stanhope, and the low-grade ore is being reduced by old patio process with success, as good returns in gold and silver are being received by the company. J. S. Ickis is manager. Ten tons daily is the present extraction; the formation of the district is quartzite and porphyry.

The owners have lately acquired rights on two waterfalls which operate the six old tahonas used in the reduction of the ores. The Valenciana Co. will soon erect a reduction plant.

The San Bartolo mines are southeast of the city of Tepic, 15 miles distant and 60 kilometers from the San Blas seaport on the Pacific coast. The average of the ore is 30 ozs. silver to the ton of 2000 lbs. and 1 oz. gold.

On the south of San Bartolo are the mines of Guadalupe and San Juan; the former has a streak averaging 300 ozs. silver per ton and 3 ozs. gold. The San Juan has ore of low grade gold and silver. The present owners have ten men at work.

The Pacific States Mining & Investment Co. of San Francisco, Cal., will soon organize a new company to develop Tepic ground.

Tepic, July 20.

The Olympia M. Co., capital $200,000, intends to work mining properties in the Moctezuma district of Sonora, 3½ miles from that owned and operated by Phelps, Dodge & Co., adjoining the San Miguelito mines.

THE KLONDIKE.

Dawson reports conglomerate discovered on Indian river. D. McKinnon claims to have discovered a "reef" on McKinnon creek, opposite the mouth of Quartz creek, from 400 to 500 feet wide, and he "thinks the space between two reefs, about 3 miles, is a solid bed of conglomerate, carrying gold." He argues that "the reef is low-grade free milling, and can be handled like that at the Treadwell mine, simply by quarrying out the face of the cliff."

Personal.

E. R. ABADIE revisited Nevada county, Cal., last week.

T. F. VAN WAGENEN is now editor Denver, Colo., Mining Reporter.

J. H. HAMMOND left Silverton, Colo., for London, via New York, last week.

D. MEANY is in charge of the Anderson Lake Co.'s property at McGillvray creek, B. C.

EDWARD BOYCE, at Jerome, Ariz., last week organized a miners' union of 500 members.

F. T. LELAND of the Risdon Iron Works has returned to San Francisco from eastern Oregon.

C. R. WORES has returned to Tucson, Ariz., from Canada, where he had been examining gold properties.

R. S. MOORE of the Risdon Iron Works, San Francisco, has returned from a business visit to Hawaii, U. S. A.

JESSE SCOBEY, mining engineer of Denver, Colo., is temporarily engaged by a mining company in Mexico.

DR. CARL PETERS, the African explorer, has gone from London to the Zambesi river to continue explorations in Eastern Mashonaland, Africa. He takes mining machinery for development of the mineral district discovered by him in 1899.

L. J. BROWNING, Supt. Chile mine, Sand Creek, Madison county, Mont., has returned from Milwaukee, Wis.

S. H. RIBBEL, who has had charge of the Leviathan mill at Mammoth, Mont., has taken charge of the Kennett, Mont., mill.

SAM W. CHEYNEY, manager of the Jamison and Keystone mines, Sierra and Plumas counties, Cal., has returned to San Francisco.

F. JENKINS will resign his mine superintendency at Silver City, Idaho, to devote his attention to developing the Dobson Jim mine near Wallace, Idaho.

E. P. JENNINGS, who had been examining mining properties in Nevada and southern California for Eastern investors, has returned to Salt Lake City, Utah.

W. H. HART, formerly in charge of the John A. Logan mine, is now in charge of the Little Pittsburgh mine of the Latrobe G. M. Co., Straub mountain, Colorado.

AT Los Angeles, Cal., the Southwest Miners' Association has elected Thos. Ewing president, J. I. Crowell and J. R. Clark vice-presidents and G. N. Nolan secretary.

F. JENKINS has resigned his position as manager of the Cumberland mine, Silver City, Idaho. R. H. Britt has been appointed to succeed him. The change took place Aug. 1.

CARL S. FOGH of Leadville, Colo., will assist A. Raht in the superintendency of the construction of the new smelter of the American Smelting & Refining Co. at Salt Lake City, Utah.

ROBERT C. GEMMEL has returned to Salt Lake City, Utah, from Magdalena, Sonora, Mexico, where he went to report on gold properties bonded by V. M. Clement in the interest of a London company.

H. P. LOWE, recently manager Topeka mine, Gilpin county, Colo., has notice from the Paris Exposition that a special medal had been awarded him for a rare specimen of gold-bearing quartz from that property.

WM. E. HOWELL of the Pilgrim mine, American Hill, Sierra county, Cal., has resigned to go to Mexico to assume charge of a concession of land owned by California men. His place will be taken by General Manager F. A. Patterson.

R. E. PALMER, chief mining engineer for the British America Corporation under W. A. Carlyle at Rossland, goes to Spain to take a position under Mr. Carlyle in the Rio Tinto mines, to be the engineer in charge of underground work.

Commercial Paragraphs.

THE Risdon Iron Works of San Francisco has an order from the Golconda mine on Cracker creek, Grant county, Or., for new machinery to sink to a depth of 2000 feet.

THE Anti-Caloric Co., 217-219 Mission street, San Francisco, has been appointed sole agent on the Pacific coast for the Boston Asbestos Paper Co. The Anti-Caloric Co. carries a full line of asbestos goods and steam packings.

C. M. HAMPSON, Denver, Colo., is supplying the Western Realty and Paving Co. with equipment for a conveyor and hoisting engine for handling basalt for paving and riprapping. It will comprise a Dillon double drum hoisting engine, with Hampson's automatic dumping device, a 350-foot span of 1¼ inch carrying cable and ¾-inch hoisting cable, the tower at dumping station being used as engine house, with second floor for engineer's station.

FLINT & LOMAX, Denver, Colo., who sustained serious damage to their shops by fire, have found much new equipment necessary as well as new stock in various departments. Tools and machines for brass work, pattern shop, assembling room and plating department have been largely replaced, including spinning lathe, pattern lathe, band and rib saws, as well as stock of brass and copper sheets. The net result is that their facilities will be better than before the fire. They employ a force of sixty men.

AMONG the bids made to the Board of Trustees of Riverside, Cal., on the proposed new electric lighting plant for that city were the following: The C. C. Moore Co., San Francisco and Los Angeles, $24,908 to $41,960 for complete plant as per specifications furnished. The Machinery & Electrical Co., Los Angeles, complete except the generator for $25,924 and $30,144. The Tracy Engineering Co., San Francisco, seven alternative proposals, prices ranging from $26,440 to $41,696. The Boothe M. & S. Co., Los Angeles, itemized its bid: offered Sioux Corliss engine, three 150 H. P. boilers with smokestacks, two Smith-Vaile feed pumps, one exhaust heater and water purifier, for $25,122; jet condenser for $800, or service condenser for $3500. The Joshua Hendy Machine Works, San Francisco, proposed to put in the plant complete as per the city's plans and specifications for $27,330.73.

JEANESVILLE IRON WORKS CO., Denver branch, received telegraph order from the American Mining Co., Wyo., for two improved No. 9 B Jeanesville sinking pumps and one duplex station pump. The shops have an order from the Anaconda Copper Co., Butte, Mont., for two special duplex pumps. They are also building a high lift compound condensing pumping plant and two improved sinking pumps for a mine in Old Mexico. The Denver branch has had a good demand for this improved No. 9 B sinker, the past two months, and high lift duplex mine pumps.

THE M. C. Bullock Mfg. Co., Chicago, Ill., have just sold a diamond drill to the Government of Chile, another to the Government of Nova Scotia; within thirty days they have sent diamond drills to Japan, Spain, Turkey, Antefogasta and various parts of the United States. They have shipped a compressor and rock drill plant to the Sea of Azof, two mine ventilators to West Virginia, hoisting plants to the Black Hills, Mesabe range and Illinois coal district; a Willans engine to St. Petersburg, another to the Massachusetts State Farm, and are just now erecting an 800 I. H. P. Corliss for the American Cereal Co.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING JULY 24, 1900.

654,562.—DOOR STOP—J. R. Bowler, Sr., Santa Ana, Cal.
654,135.—RAISIN CLEANER—C. J. Clarke, Kingsburg, Cal.
654,521.—WAVE MOTOR—E. P. Conture, Gualala, Cal.
654,525.—SEED DRILLS—Dorsey & Mathews, Los Angeles, Cal.
654,526.—LIQUID MIXER—E. T. Downing, Napa, Cal.
654,579.—DOOR BOLT—A. Ericson, S. F.
654,346.—VISON ADJUSTER—F. H. Graham, San Jose, Cal.
654,248.—PAPER CUTTING MACHINE—F. Hager, Portland, Or.
654,250.—FURNACE—A. Heberer, Alameda, Cal.
654,399.—PRUNE GATHERER—O. S. & M. T. Hoover, Mount View, Cal.
654,349.—AX—S. T. Johnston, Trinidad, Cal.
654,315.—WORKING ORES—T. E. Luce, Bishop, Cal.
654,267.—TRAVELING BAG—A. Mieden, Seattle, Wash.
654,320.—ELECTRIC HEATER—R. R. Morison, S. F.
654,486.—LENS POLISHER—O. Pederson, Los Angeles, Cal.
654,487.—SWEEPING MACHINE—O. Pederson, Los Angeles, Cal.
654,323.—PUMP—G. W. Price, S. F.
654,327.—SWITCH—T. S. Savage, Oakland, Cal.
654,283.—PIPE WRENCH—A. J. Sarvin, Springville, Cal.
654,420.—ORE STAMP—D. M. & J. E. Smyth, Pasadena, Cal.
654,333.—DUMP WAGON—P. Vasquez, Halfmoon Bay, Cal.
654,580.—LAMP FILLER—H. H. Venable, Redondo, Cal.
33,011.—DESIGN—W. G. Dodd, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC HEATER.—No. 654,320. July 24, 1900. R. R. Morrison, San Francisco, Cal. The object of this invention is to provide a means for annealing gold for dental uses, for heating water, for sterilizing surgical or dental instruments, for heating wax composition of rubber and the like, or other heating instruments for the preparation and convenient application of antiseptic dressings and similar purposes where the heater can be used. It comprises an open central stand or support with a shallow pan within the opening, and ribs by which the pan is suspended out of direct contact with the stand. A second pan fits within the first named one, with means interposed between the two for electrically heating them and means for controlling the electrical current. An annular disk lies upon the bottom of the pan with a flanged opening, which exposes a part of the bottom and forms a restricted operating surface;

means are also provided for controlling the electrical current.

AUTOMATIC SWITCH.—No. 654,327. July 24, 1900. T. S. Savage, Oakland, Cal. The object of this invention is to provide a means by which the motorman or other operator upon a car or like traveling vehicle can determine the direction in which the car should travel upon arriving at a switch where two tracks diverge from each other. At the point where the main and branch line of the track separates is a spring-pressed switch point normally closed to cause the cars to move upon one line of track. A rock shaft and arms carried thereby are provided, one of which connects with the switch point and the other with a pressure plate which projects into the path of the car wheels so as to be depressed by the weight of the passing wheels and throw the switch point away from its contact with the track. A spring acts to return this switch point after the wheels have passed the pressure plate. By means of a foot pedal upon the car, the plates are depressed so as to pass inside the switch point after it has been moved away from its contact and to thus retain it in such position while the car wheels pass upon the other line of track.

WAGON DUMPING GEARS.—No. 654,333. July 24, 1900. P. Vasquez, Half Moon Bay, Cal. The object of this invention is to provide a mechanism for moving the containing box or body of a wagon or similar vehicle in a longitudinal direction and tilting the same to discharge the load carried thereby. It comprises a rock bar or equivalent device carried upon a wagon body, a pinion mounted upon a journal shaft and having teeth engaging the rack and means for rotating the pinion so that by its engagement with the rack it will draw the latter and the wagon body rearwardly upon the bed until it arrives at a point where it will tilt and discharge its load. In conjunction with this are stops which engage with the shaft or roller and form a bearing about which the box tilts, and which prevent its sliding farther to the rear. Rollers are journaled upon the bed to form an anti-frictional support, upon which the box travels easily when it is moved forward or backward.

APPARATUS FOR WORKING ORES OF VALUABLE METALS.—No. 654,315. July 24, 1900. T. E. Leece, Bishop, Cal. This invention relates to an apparatus which is designed for working the ores of valuable metals, and is especially useful for separating slimes from solutions in which they may occur, and also for separating heavier and lighter parts under any condition in which they may be found associated. It consists essentially of a tank having one side at a considerable inclination, and within this tank is an endless traveling belt with directing rollers so that one portion of the belt is caused to travel through the tank in close proximity with the bottom, and the other part is guided back exterior to the tank by similar rollers. The material is delivered into the deeper portion of the tank and the heavier part settles down upon the belt, which continually travels up the incline to a point of discharge exterior to the tank. Transverse partitions having flexible sweeping lower edges in contact with the inclined portion of the belt keep the slimes upon and in close proximity with the belt as they travel upward. A suitable discharge chute receives the material, and the belt is cleaned by water jets and by a revolving brush before returning beneath the tank to again enter it.

The Johnston Pipe Wrench.

WM. B. VOLGER, 88 Chambers St., N. Y.: The large automatic pipe wrench which you sent me January last has been in almost daily use, is as good to-day as when we received it, and is the best tool for the purpose that we have. It is very essential that all the joints made up be absolutely tight, and this wrench has been used in making up over 500 joints, consisting of extra heavy pipe and extra heavy fitting, and not one of these joints has ever leaked.

We attribute this success very largely to the wrench, which grips the pipe in such a way that we have never hesitated in putting the greatest strain upon it, without any fear of crushing the pipe.

I made personally over half of these joints myself with this wrench, and say unhesitatingly that it is the best tool of its kind that I have ever seen.

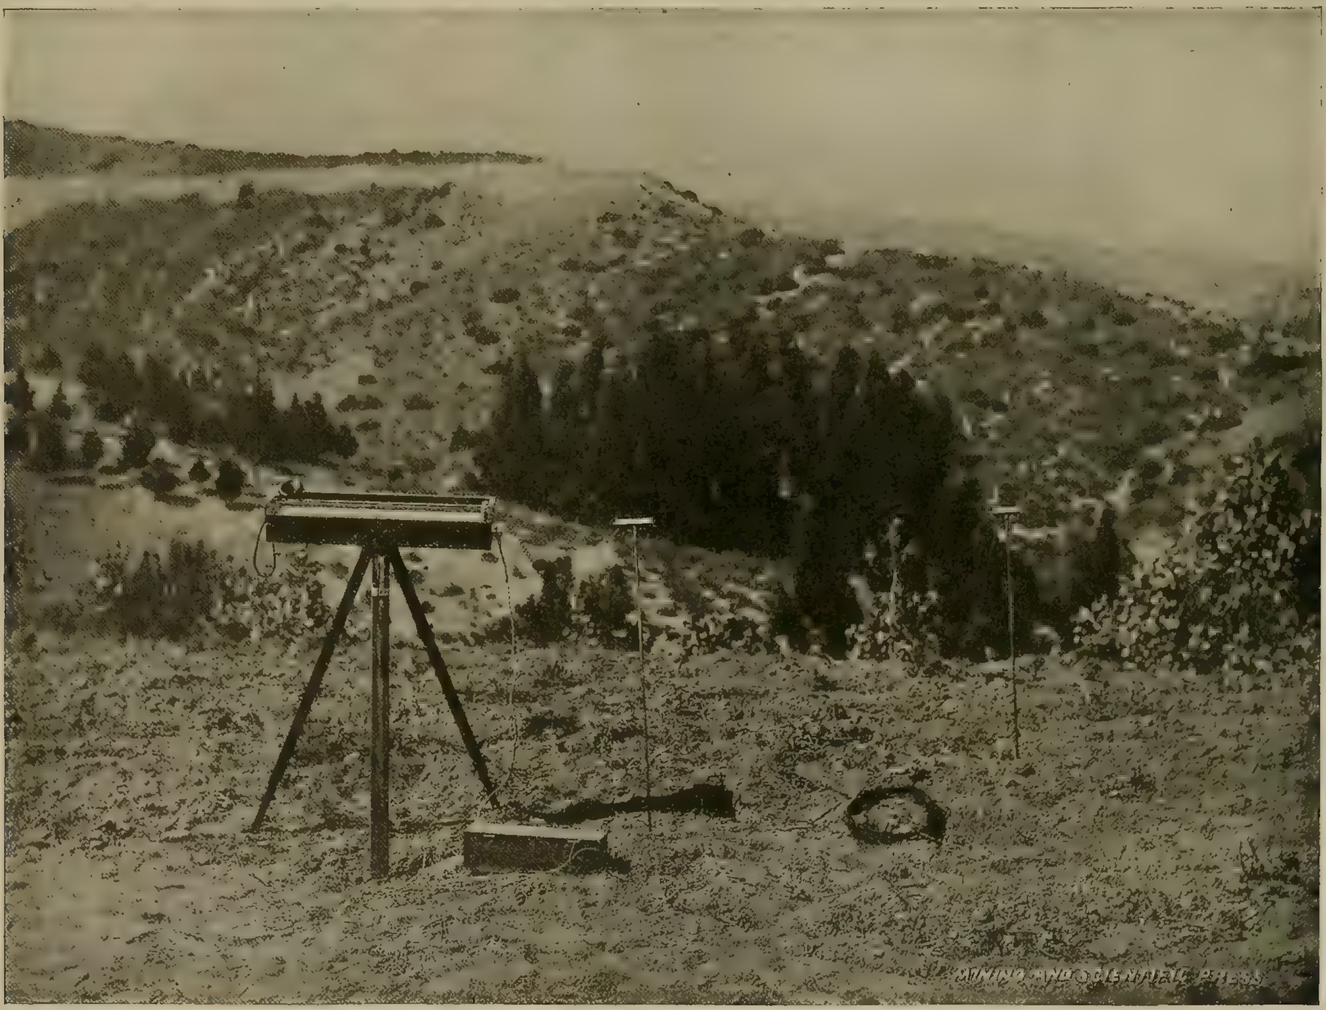
WM. E. WORTH.

Wilmington, N. C., June 24.

This tool is intended for use in different mining sections, giving general satisfaction.

Recently Declared Mining Dividends.

Magnolia Co., Colo., 17 cents a share, $187,000	July 28
Mammoth M. Co., Utah, 5 cents a share, $20,000	Aug. 1
Hecla M. Co., Idaho, 2 cents per share, $20,000	Aug. 1
Buffalo Hump M. Co., Idaho, 10 cents per share	Aug. 1
Bunker Hill & Sullivan M. & C. Co., Idaho, $21,000	Aug. 4
Independence T. & M. Co., Colo., 4 cents per share	Aug. 6
Swansea M. Co., Utah, 5 cents a share, $5000	Aug. 10
Standard Con. M. Co., Cal., 10 cents per share	Aug. 23



Brown's Electro-Geodetic Mineral Finder.

An Electrical Geodetic Apparatus.

Among other new things in the mining and scientific world is what is styled an "electric survey." Men have always claimed ability to tell where mineral is located, by surface indications, and it is not strange that, with the new order of things, the old divining rods and "dousing sticks" should be discarded and electricity brought into the effort to indicate the location and course of mineral veins. F. H. Brown of Los Angeles, Cal., has a patented device that he styles an "electro-geodetic mineral finder." He furnishes the following explanation of its operation:

"The instrument used is a modification of the common form of the Wheatstone bridge, the modifications rendering the instrument capable of overcoming the inaccuracies of measurement heretofore caused by earth currents and abnormal resistances set up by electrolysis when battery currents are sent into the earth from a metallic electrode. In using the machine the custom is to make many measurements of the resistances of the same definite length of earth in a given locality. If there are no ore bodies within one-half of the distance between the electrodes from the surface of the earth, the current will find the path of least resistance in the moist earth nearest below the crust and close its circuit through that path. Under this condition, all the resistances in the locality will approximate the same. In taking these different measurements, however, should we measure the resistance of a certain definite length of earth underneath which lay a body of ore, less than one-half the distance between the electrodes, from the surface, then the current would find the path of least resistance, in passing down vertically to the ore body to a point nearest the positive electrode or rod, would pass laterally through the ore body to a point nearest the other rod or electrode, then vertically upwards to the other electrode.

"The lateral resistance through the ore body would show comparatively no resistance and the reading on the instrument would be only one-half to nine-tenths of the amount indicated on the instrument by the other definite lengths under which there was no ore.

"To tell the depth of the ore body from the surface it is only necessary to vary the length of earth measurements, as for example: If a body of ore was 100 feet beneath the surface, 100-foot measurements over this ore would not indicate its presence, for the reason that the current would have to go down 100 feet to the ore, pass laterally through it and up through another 100 feet of earth resistance, thus passing through two vertical earth resistances of 100 feet each, aggregating 200 feet of earth resistance as against only 100 feet on the surface, in which case the path of least resistance would be near the surface. In order to indicate the presence of this ore body 100 feet beneath the surface it would be only necessary to take surveys of a little over twice the depth, say 220 feet. In this condition the two vertical resistances of the earth, aggregating 200 feet, would be less than the surface resistance of 220 feet, and the current, seeking the path of least resistance, would go down to the ore, pass laterally through it and go vertically up to the other rod; and to locate it, it would be only necessary to take several parallel or radial measurements of the same definite length. A measurement taken over the ore vein or body would be low. The other measurements taken of the same definite length, for comparison, being removed from and not over the ore body, would be higher, and it is only necessary to shorten up the length of earth measured to arrive at a point where the current will leave the ore body and pass through the crust to approximate the depth. The variations of the instrument, being very marked, will show the depth.

"For a further description of this process I refer to patent No. 645,910, March 20, 1900."

The illustration gives an idea of how the apparatus looks in readiness to operate. Its inventor claims that it is "thoroughly scientific," and that he can locate gold and other metals by its use.

Latest Market Reports.

SAN FRANCISCO, Aug. 2, 1900.

SILVER—Per oz., Troy: London, 28d (standard ounce, 925 fine); New York, bar silver, 60⅜c (1000 fine); San Francisco, 60⅜c; Mexican dollars, 48½c.

The rapid increase in gold production in the United States and the large excess of exports over imports have been accompanied by a marked increase in the money in circulation in the United States, which stood on July 1st of each year as follows:

Date.	Gold and gold certificates.	Total money of all kinds in circulation.	Per capita money in circulation.
1896..	$498,449,242	$1,509,725,200	$21.15
1897	556,432,594	1,646,028,246	22 57
1898..	698,780,519	1,843,435,749	24 74
1899	734,716,728	1,932,484,239	25.38
1900..	815,474,460	2,062,425,496	26.50

The coinage at the San Francisco Mint for July amounted to $6,680,827. It was issued in the following denominations: Double eagles, $6,540,000; half-dollars, $130,000; dimes, $10,827.

COPPER.—New York: Lake, 1 to 3 casks, 16.25 cash; carload lots, 16.00; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.25; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.00; Salt Lake City, 3.87½; St. Louis, $3.95; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 12s 6d = 3.82½c per ℔.

SPELTER. — New York, $4.25; St. Louis, $4.15; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10¾c; Hallett's, 9¾c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, pig, No. 2, foundry, $15.50; gray forge, $15.00; San Francisco, bar, per lb., 2¾c. in small quantities.

STEEL. — Billets, Pittsburg, $19.00; bars, 1.10; San Francisco, bar, 7c to 12c per lb.

Pittsburg reports: The usual slump in the price of iron and steel, which comes along every August, is on, and buyers are waiting for rock bottom to be reached before placing their orders. Dealers say that this has already been touched, and, in fact, one prominent firm has refused several orders at current prices, although this only applies to steel wire.

There is one branch of the trade which is a most uncertain quantity, and that is tool steel. Thirteen of the principal tool steel companies in the country have formed a combination under the title of the Crucible Steel Company of America. As they represent about 95% of the total output, they may conclude to stiffen the price of tool steel, the price of which has only been raised once in fifteen years. But as there is a keen competition between the tool steel of this country and that of foreign manufacture, that fact may act as a brake on any advance.

The Pittsburg Commercial gives the following details of the disagreement existing between the Bessemer Pig Iron Association and the Steel & Wire Co.: "The Steel & Wire Co. some months ago contracted with the Bessemer Association for the delivery of 50,000 tons of Bessemer iron at an average of $25 a ton, deliveries to run until August. Of this tonnage 30,000 tons have been shipped, but 20,000 tons have not been taken from the furnace men, and the Wire Co. has declined to name a place where the iron may be delivered. The furnace owners claim that the action of the Steel & Wire Co. is due to the decline of $7 a ton in Bessemer pig, but that they propose to hold the Steel & Wire Co. to its contract."

The Bessemer Association has about 75,000 tons of pig iron on its books contracted for at from $22.50 to $24 per ton, and in many cases the buyers are trying to get rid of taking the goods. Some of the furnace owners say that the contracts will go into court; others believe that an amicable settlement will be made.

QUICKSILVER. — New York, $51.00; London, £9 10s; San Francisco, local, $50.00 ⅌ flask of 76½ ℔s.; Export, $47.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¾c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21¼c; San Francisco, Plumbers', 100-℔. lots, 18¼c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $32.50; San Francisco, ton lots, 34c; 1000 ℔s., 34½c; 500 ℔s., 35c; less, 36c; bar tin, ⅌ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.— San Francisco, crude, $17 ⅌ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ⅌ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 79c; cs., 84c; raw, bbl., 77c; cs., 82c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $2.95; single tape, $2.35; Hemp, $2.00; Cement No. 2, $2.95; Cement No. 1, $2.35, in lots of 3000 feet and up.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 45@50c ⅌ ℔.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ⅌ set; 14 oz., 40s., 10½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

SITUATIONS WANTED.

WANTED.—A SITUATION BY A COMPETENT Assayer, Surveyor, Draughtsman and Bookkeeper, with good references. Address L. R., this office.

SITUATION WANTED

by a young man who has just finished a course in assaying and surveying. One with a mining expert preferred. Address W. B M., this office.

Experienced Accountant and Assayer, with knowledge of cyaniding and complete assay outfit, wishes employment with mining company, or would like to hear of favorable field for custom assay office. Highest references. Address L. S. U., this office.

ASSAYER—CHEMIST

desires appointment Four years chief assayer in present situation—one of the largest gold-silver mines. Highest testimonials. Address Assayer, Mining and Scientific Press.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

An Experienced, Aggressive Mining Engineer and Metallurgist, technical graduate, eighteen years' practical experience in the United States and Canada as manager and consulting engineer of mines and mills, is open to engagement as manager, superintendent or chemist. Thoroughly understands economic mining and reduction of gold and silver ores. Not afraid of a hard proposition. Can leave present position with month's notice. Correspondence solicited and references exchanged. Address KARL NEITZEL, Camp McKinney, B. C

CYANIDING.

Have had charge of five mills and worked in every part of process from shoveling to laboratory work. Test ores and outline process for treating them. For three years treated SLIMES successfully Wish a position after July 10. Have studied to excel. References as to character and ability.

Address I B., care Mining and Scientific Press.

WANTED.

WANTED.—A CHEMIST AND ASSAYER FULLY conversant with the latest and most economical methods of cyaniding; also an Assistant Assayer and Chemist. State salary expected and forward testimonials. Address "Extraction," care of Mining and Scientific Press.

TO MINING EXPERTS.

WANTED.—A proposition containing magnetic pyrites (Fe_7 S_8 to Fe_{11} to S_{12}).

Address THOS. L. NEAL, Attorney, Lankershim Block, Los Angeles, Cal.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

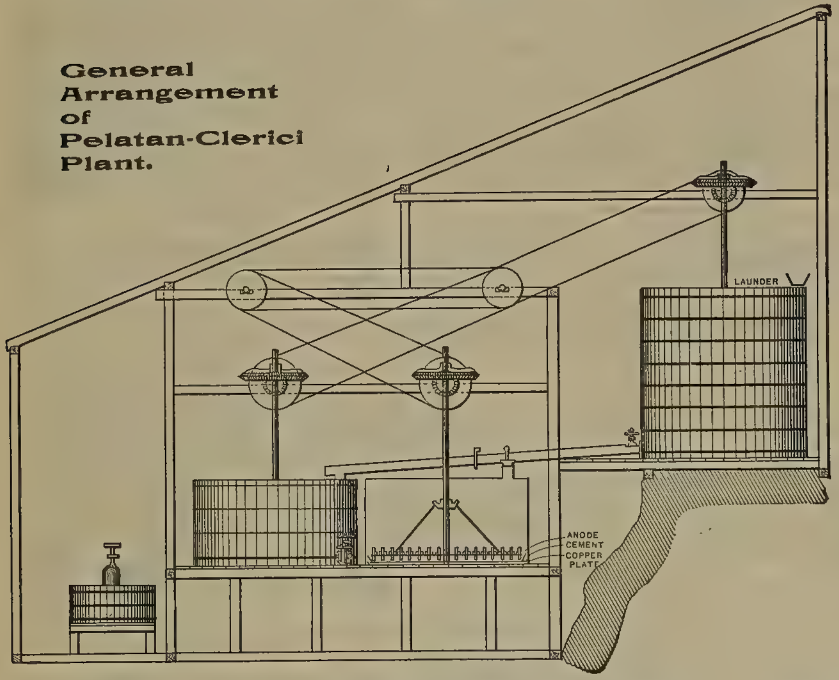
THE "PELATAN=CLERICI" PROCESS

OF TREATING REFRACTORY ORES



General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

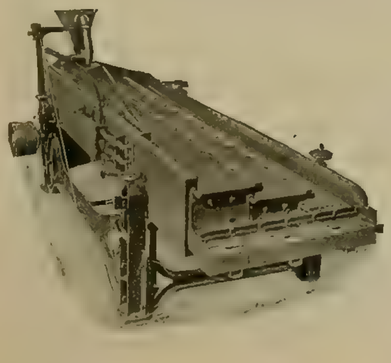
THE IMPROVED BARTLETT CONCENTRATING TABLE.

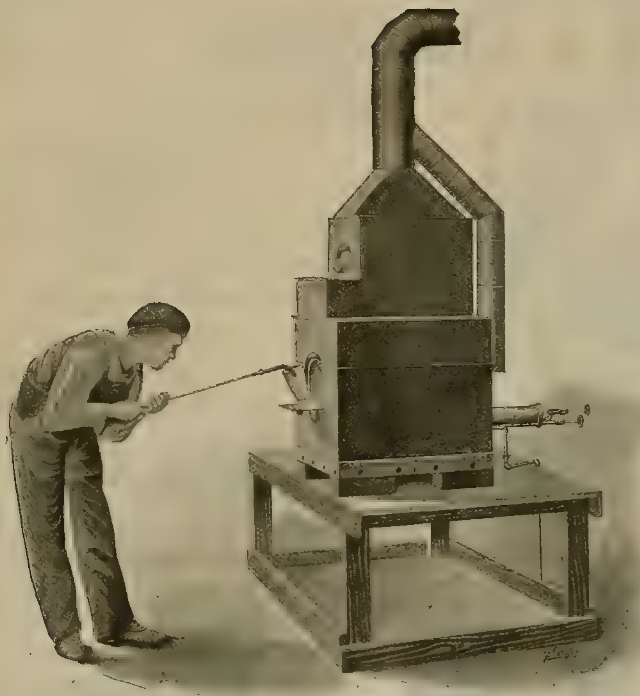


The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

THE COLORADO IRON WORKS CO.,
Established 1860. DENVER, COLO., U. S. A.



NO TROUBLE TO OPERATE--A BOY COULD RUN IT.

TO ASSAYERS:

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

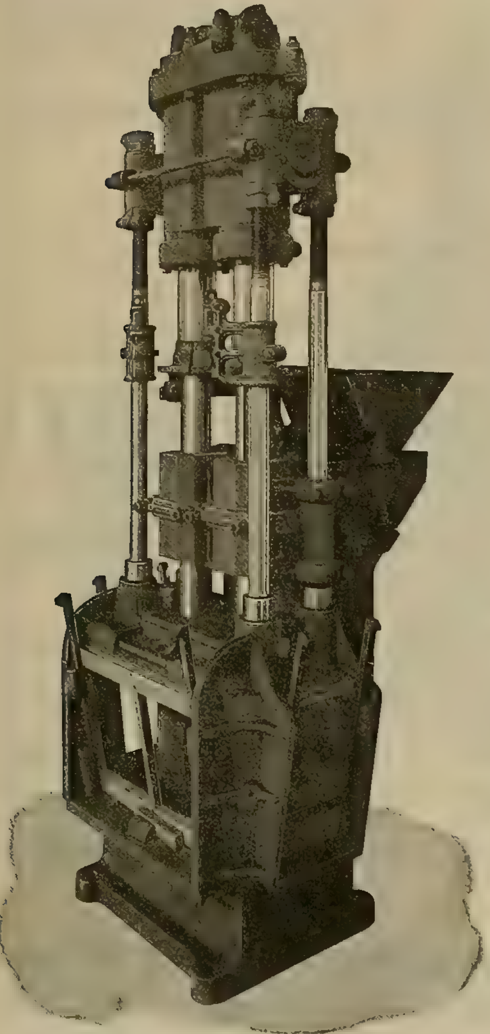
GATES IRON WORKS.



THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,
[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,
M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ , AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,
[SIGNED] GEO. HEWER.

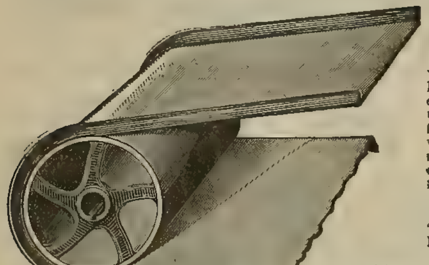
SPADONE'S CONCENTRATOR BELTS.



PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

TRADE MARK

CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

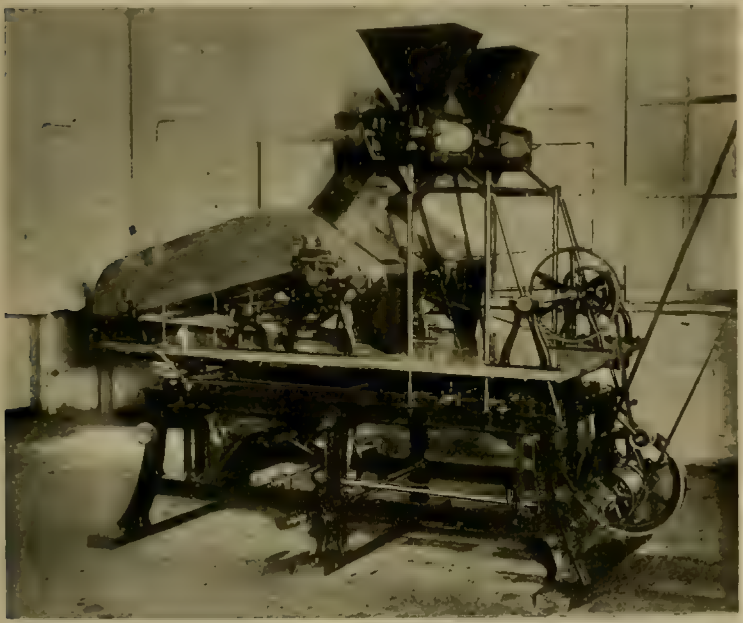
F. W. McNAIR, President, Houghton, Mich.

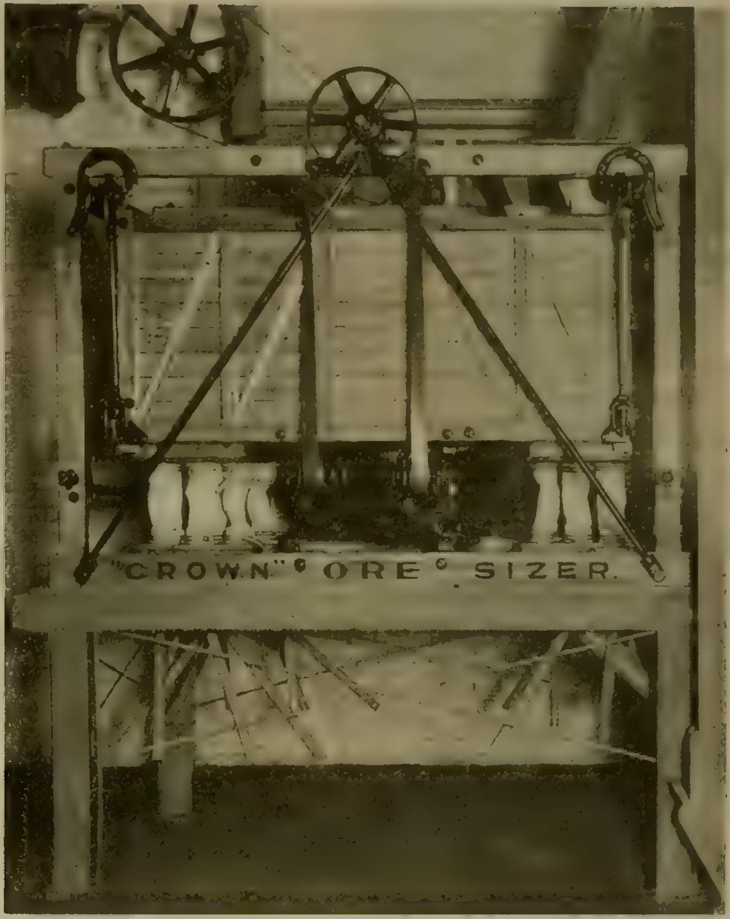
THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from F. E. Thomas, in the Gold Run Placer Claim near Quincy, Plumas Co., to deposit tailings on a flat; from Walter C. Robinson, in the Deadwood Hill Mine, near Meadow Valley, Plumas Co., to deposit tailings in Deadwood Creek; from W. B. Meek, in the Indian Hill Mine, near Camptonville, Yuba Co., to deposit tailings in Indian Creek; from the La Porte Consolidated Gold Mining Co., in the Dutch Mine, near La Porte, Plumas Co., to deposit tailings in Rabbit Creek; from J. T. Birmingham, in the Strawberry Mine, at Strawberry Valley, Yuba Co., to deposit tailings in a worked-out pit; and from C. M. Jurgenson, in the Garden City Mine, near Gibsonville, Sierra Co., to deposit tailings in a ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on August 13, 1900, at 1:30 P. M.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



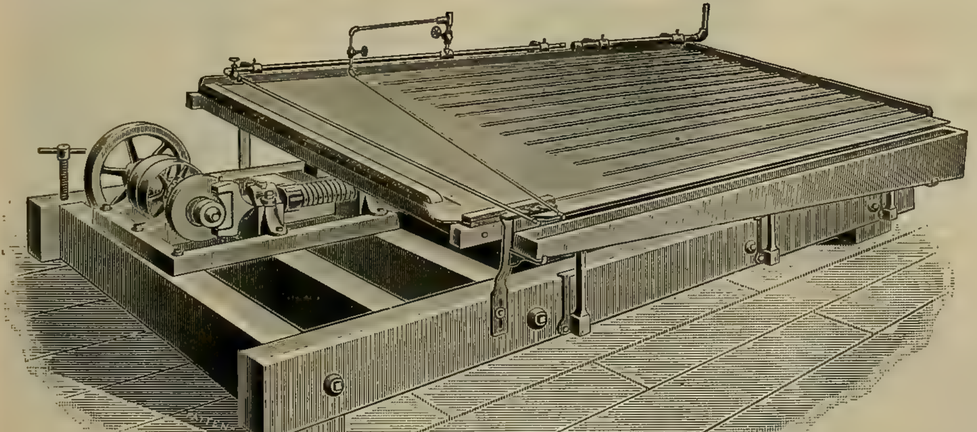


Works, 23 Stevenson St. Office, 230 Post St. SAN FRANCISCO, CAL.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS, Dept. UU, 650 Elston Ave., CHICAGO.**



WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**

Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake.

No better device has been designed for this purpose. For prices and further information address the builders.

Oriental Gas Engine Co., 227 Folsom St., S. F.

THE LITTLE ALASKA GOLD WASHER.
Price **$6.** Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

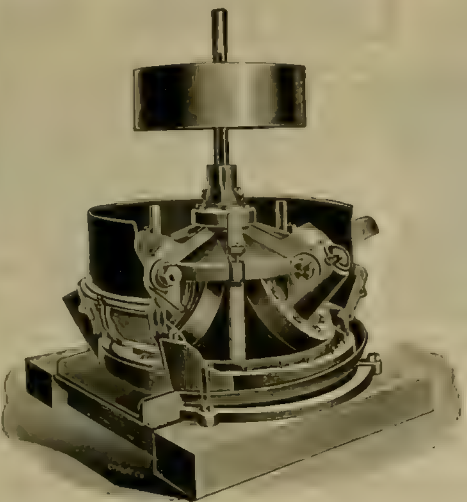
In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.



THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

DELINQUENT SALE NOTICE.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 12) levied on the 4th day of June, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
F. Knottner	20	1,000	$50 00
F. Knottner	110	500	25 00
F. Knottner	111	500	25 00
L. Knottner	112	150	7 50
E Knottner	113	150	7 50
O. Knottner	114	100	5 00
G. Knottner	115	100	5 00
J. Gretz (balance)	186	1,500	70 00
F. E. Hartmann	223	250	12 50
C. A. Mueller	226	500	25 00
C. A. Mueller	229	500	25 00
G. Berbert	228	350	17 50

And in accordance with law, and an order from the Board of Directors, made on the 4th day of June, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 773 Mission street, San Francisco, California, on MONDAY, the 20th day of August, 1900, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

* * *

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Testing Oils.

A good way to test oils is to place them side by side on blotting paper, and place this for a short time on the cylinder chest or on a steam heater. The oil which penetrates the blotting paper quickest and spreads widest over it is always the poorest oil; the oil which spreads widest in part and leaves a defined ring in the center, must be a compounded oil, as it shows by its lightness and quicker disappearance of the outer ring that it is compounded from material of a very light gravity. If on longer exposure to heat, or by giving it more time, the whole of the oil on the blotting paper disappears, the sample must be composed entirely of mineral oil; and when an inner ring with a well-discernible ridge is formed and remains longer, a proportion of paraffine-holding stock must have been compounded with a lighter mineral oil; and when a center ring of decided outline and darker color is formed, and no permanent translucency imparted to the paper, the compound must have been made of light hydrocarbon oil with an addition of still residuum stock, however well defined or bleached.

◆

The highest voltage used for electrical transmission outside of California is in the Provo plant of the Telluride Power Transmission Co. in Utah, which transmits power 35 miles to the Mercur mills at 40,000 volts. Raising transformers are three in number and are connected in the star form. Each transformer has a capacity of 250 kilowatts. The middle points of both the high-tension and low-tension circuits are grounded. In general design these transformers resemble the transformers used in the high-tension tests at Telluride, the design and construction having been under the direction of the same man in both cases. The line extends from Provo at an elevation of 4500 feet to Mercur, at 2000 feet above Provo, and the line reaches an extreme height of about 10,000 feet above the sea level. Three miles of the line are strictly mountain construction. The lightning protection is afforded by choke coils and non-arcing metal arresters. The insulators are of glass. The design was based on the tests at Telluride and they were made especially for this plant. The insulators are held on special pins of oak which are thoroughly paraffined. The lower part of the insulator is 5 inches above the cross-arm.

Concerning the Mining Industry.

In last week's issue mention was made of the commendable character of the practical work being done by the U. S. Geological Survey and its immediate value to the miner. It was the intention this week to go further into the subject. The subsequent receipt of a monograph by Director Walcott of the U. S. G. S., read before the Washington meeting of A. I. M. E., on "The Work of the U. S. Geological Survey in Relation to the Mineral Resources of the U. S.," shows that in that paper the head of the Survey goes into the discussion, and puts it about as it was intended to editorially discuss it. Hence as a subject of great general interest is herewith given in a condensed form some of what Director Walcott has to say concerning the connection of the economic work of his Bureau with the mining industry.

The general principle upon which the Survey has been doing its economic mining work is, that it should endeavor to accomplish for the mining industry, as a whole, what the individual mining engineer or mine owner cannot succeed by his unaided exertions in doing; that it should not undertake to do what could be done as well, if not better, by individual exertion; that it should not interfere, either favorably or unfavorably, with the private business of individuals or corporations, or enter into competition in their legitimate occupations with professional men, such as mining engineers, etc.

If it were more generally understood that such is a proper limitation of the work of the members of the Survey, they would not be asked, as they frequently are, to tell some individual or corporation whether his or its land contains valuable mineral deposits, since all the information they are at liberty to impart with regard to that land is contained in the published maps and reports, which may be obtained by all. If the individual or corporation is unable to deduce from these publications all the commercial data that may be desired, a mining engineer should be employed for the purpose. An attempt by the Survey to acquire and communicate such information respecting any parcel of land would be in the nature of a report for private parties, which would be an interference with the business of the mining engineer and a violation of law. Neither should the Survey be called upon to assay or analyze ores for private parties, for that is manifestly interference with the business of the assayer; nor should it be called upon, as it sometimes is, to tell a man what process, or which of two or more processes, is best adapted for the treatment of his ores. Even if the members of the Survey were fitted to pass judgment upon the relative value of technical processes or machines, and should pronounce such judgments, they would naturally be regarded as interfering unwarrantably with the business of the person or corporation owning a process or machine which was not favorably considered in their report. If it were proper that work of this nature should be done, it would be impossible to acquire the knowledge necessary to meet such demands with the amount of money at present available, or even with ten times that amount.

In the field of more purely geologic investigation, the general object has been the determination of laws which govern the formation of deposits of the useful minerals, and of the rock formations in which they are most likely to be found. This object can be attained only by long and careful study of many and varied deposits—as far as possible in the condition in which they were originally formed. Ore deposits are as a rule the result, not of a single process, but of many successive concentrations of minerals; and in those deposits which are found near the present surface, the effects of the latest of these processes—weathering or the action of surface waters—are likely to have obscured all others. In order best to accomplish the object sought, the first studies were made of mining districts in which mining developments have been most extensive, the mines are deepest, and the most varied forms of ore deposits have been disclosed.

In the prosecution of these studies, the geologists often obtain results of immediate value to the miners and mine owners of the particular district under investigation, such as the determination of the probable direction which the ore bodies will take in unexplored ground, the faults which are likely to cut them off, and other obvious limitatations which geologic conditions may suggest. These results are often of secondary importance as compared with the more general deductions, being useful to only a few persons interested in a limited district, while the general deductions, if correct, are of benefit to the whole mining community.

A brief statement of the underlying principles which govern our choice of fields of work is made, because that work has been frequently criticised: the criticsm made by miners being that the Survey chooses developed districts, where the general facts with regard to ore deposits are already known, rather than undeveloped districts, where the predictions might be of more use to those who own mines, and might actually help in their development. From a partially developed district we can usually learn only superficial facts, which are not likely to yield any contribution to general laws. Whatever may be said of the probable value of such a district belongs to the province of the mining engineer rather than to that of the Government geologist, since it involves such preliminary work as sampling of ores, prospecting, development, etc., which the geologist cannot do.

Another criticism has been that more work is done in one State than in another. But if it be admitted that the principles mentioned should govern our work, it is evident that we cannot be guided by geographic or political considerations, but that we must study ore deposits where they can be studied to the best advantage. In the topographic work of the Survey a more or less general geographic distribution has been possible, and it is also desirable, but in geology the Survey must continue to be the judge of the importance and interdependence of the problems to be solved, and of the best method of solving them.

A correct geologic map is the first and most essential basis for the study of a mining district; and where the deposits are beds in sedimentary strata, as is the case with coal, and sometimes with iron ore and other substances, it furnishes practically all that the mining engineer needs for opening and exploiting the mines. By the folio publication, however, a new avenue is opened for disseminating geologic information promptly and without waiting for a final and exhaustive report. Where important groups of mines are concentrated within small areas, special maps of size to fit the folio are made of those areas, on the largest practicable scale, accompanied by sections and explanatory texts setting forth in concise terms the main facts of importance to the miner, and these are published as special folios; that is, folios that do not form an integral part of the regular Geologic Atlas of the United States. In this form there have already been published folios covering Cripple Creek and Tenmile districts in Colorado, the Nevada City in California, and the Butte district in Montana. A folio of this form often supplements a monographic report, as it meets the demand of the mine owner for more prompt issue, and may be produced at smaller cost than a monograph. On the other hand, it is less likely to result in scientific deductions of general applicability, unless it is followed by a monographic report.

It may be anticipated that in the course of time the incidental areal surveys and studies of special minerals will gradually supersede those of the small groups of important mines; but at present we have plans made for surveys of a dozen or more mining districts in the western portion of the United States, and of several in the central and eastern parts, which, under the present appropriations, can only be taken up one at a time and at considerable intervals.

In the line of what may be considered technical studies, the duties of the Survey toward mining industry are less easy to define; for in this line there is more danger of encroaching upon the legitimate field of the mining engineer or metallurgist. Yet the same general principle is applicable here; namely, that the Survey should confine itself to those investigations which it is better fitted to make than is the individual. Thus, in our early work on Leadville, where lead smelting had recently reached a stage of development hitherto unknown in this country, it was thought that a scientific discussion of the processes involved, in the light of the improvements made in practical methods, would be of advantage to the smelting community throughout the country. It was found, however, that so great was the commercial importance of the industry, and so rapid the advancement in metallurgic science, that the delays inherent in a Government publication greatly impaired, if they did not altogether nullify its value.

It is evident that the investigation of technical processes in their commercial application is not a legitimate function of the Survey. Its employes are expressly shut out from a commercial use of their knowledge, and are chosen for their proficiency in geology rather than in technology. There may arise cases, however, in which it will appear possible for them to determine the underlying principles or laws that should govern some widely applied technical process, and in which it will seem advisable and proper for them to undertake such investigations.

It seems evident that the collecting of accurate statistics of the mineral productions of the country, which form the most important basis of all mining business, is a prime duty of the Survey. No branch of statistical science is in greater need of technical knowledge and thorough system than that which deals with mineral production, and none is more liable to be led into error, if the collector's opinions are in any way biased by his interest. There is no body of men more absolutely disinterested than the employes of the Survey, since, under the law, they can have no commercial interest in the subjects which they treat. Their field of work is so wide that, by one or another, a certain personal familiarity with all the sources of supply of the various mineral products of the country is acquired, which is available for the guidance of the statistical division.

At the last session of the Fifty-fifth Congress an amendment was introduced establishing a Division of Mines and Mining in the Survey. This extended its sphere of statistical work to gold and silver, and made a special appropriation for the division. It also provided means for the more prompt publication of its reports. Had this amendment passed, it is believed that the scope of usefulness of the work of the Survey would have been very materially increased. All of its various economic branches would then have been conducted under the supervision of a single chief, by which means a more uniform and comprehensive system, both of field work and of publication, might have been inaugurated.

When the division abandoned the subject of mining technology, its designation was changed to the Division of Mineral Resources. In accordance with the duties implied by this title, more and more attention has been paid to statements of the geologic and geographic distribution of our mineral wealth, whether developed or not; and the immediate future will see this important work of the Survey expanded.

For more than ten years the Division of Hydrography of the Survey has been making measurements of streams and computations of their daily discharge at various points. At the same time, it has been investigating the movements of underground waters and the causes which give rise to them. The results have economic importance to the miner in his underground operations, as he must often contend with water, and his ability to dispose of it successfully may govern the question of profits. He often seeks in flowing water the power for operating, directly or indirectly, mines, mills, etc. In many sections the location of reduction works is governed largely by the question of water supply and its permanence through seasons and years. The results of the investigations of the hydrographers are sought in considering the erection of plants of this character.

There is also an indirect way in which the question of water supply affects the feasibility or profits of mining. Throughout the western third of the United States, from the Rocky Mountain region westward, there are great deposits of ore, the value of which per ton is so small that they cannot be profitably worked unless many conditions are favorable, such as cheap foodstuffs and ready transportation, by which the cost of living and of labor may be reduced. The region as a whole is arid, and farm and other products, brought from the humid regions, are expensive. By the development of agriculture through irrigation, and the building up of small producing communities throughout the semi-arid and arid West, the cost of living is greatly reduced, and it becomes practicable to work to advantage mineral deposits otherwise unprofitable. This dotting of the country with farms and villages is possible through a careful conservation of the available waters, such as can result only from a thorough knowledge of the natural conditions. This knowledge is being obtained, through the Division of Hydrography, as rapidly as the means available will permit.

Concentrates.

THE atomic weight of tellurium is 127.9.

THE temperature of the Bunsen flame is 1,820° C., or 3,308° F.

THE acetylene light is produced by a gas made by dropping water on broken pieces of calcium carbide.

ENGINEERS say that up to 100,000 gallons wooden tanks are best; above that capacity some recommend steel tanks.

ALUMINUM melts at 625° C., or 1.157° F. It can be alloyed with copper, nickel, tungsten, manganese, chromium, zinc or tin.

A MAN'S salary is determined by what he is able to earn, and it is very seldom the case that he long continues to get less.

A DEBTOR who pays the debt to the original creditor after notice of an assignment of the debt is not absolved from liability to pay it to the assignee.

PATENTS have been granted for sundry forms of electro-magnetic ore stamps; but, so far as known, no device of that nature is in commercial use.

ALL water has action on copper; hard water has little action on lead, but soft water and highly carbonated water dissolves lead in considerable quantity.

IN the absence of misconduct or want of good faith in an arbitrator, the fact that the award seems too high or too low is not ground for a judicial interference.

ENGINEERING has been defined as being "the art of making a dollar earn the most interest." Art is applied science, and science is simply organized knowledge.

THE pressure on a stationary square yard of surface exposed to a 60-mile wind, is the same as the pressure on a square yard of surface moving at the rate of 60 miles per hour through still air.

THE average tensile strength per square inch of copper is as follows: Cast, 19,000 pounds; sheet, 30,000; bolts, 36,000; wire, 16,500. The average tensile strength of cast brass is 18,000 pounds per square inch.

ON this earth the important constituents of the atmosphere are nitrogen, oxygen, argon, carbon dioxide, water vapor and ammonia, and their densities are, respectively, 14, 16, 20, 22, 9, 8.51, hydrogen being taken as unity.

ELECTRICITY in mining is probably used to a greater extent in Cripple Creek district, Colorado, than in any other similar area. The most advanced "scientific mining" is considered by many to be best exemplified in the copper mines of Lake Superior.

IT is entirely feasible to build and successfully operate a steam railway with a 2-foot gauge, and a road with that gauge can be built and equipped at a cost not to exceed 25% of the cost of building and equipping a line 4 feet 8½ inch gauge.

CALAMINE is the hydrous silicate of zinc; color white, bluish, green or brown; luster, sub-pearly; translucent; hardness, 5; composition, zinc oxide 67.5%, silica 25%, water 7.5%. Under the blowpipe it gives off fumes of zinc on charcoal which cover the latter.

TO PRODUCE the purple of cassius, the appearance of which will indicate the presence of gold, take four ounces of finely pulverized gold ore, cover with an equal amount of bromine water, and, after standing and agitating for one hour, filter the solution, adding tin chloride solution to the filtrate.

THE value of a water-wheel governor is measured by the promptness and ease with which it will move the water-wheel gates to the correct position and stop them when they get there, and its ability to compensate by adjustment of the gate for the kinetic energy in the moving water column.

SPONTANEOUS COMBUSTION of coal is induced by condensation and absorbtion of the oxygen of the atmosphere by the coal. Action of moisture on sulphur of pyritous coal readily induces it taking fire. Coal importers say coal should be mined at least a month before being loaded for long sea voyage.

AN oil pipe line in Kern county, Cal., or elsewhere, made of glass, might be practicable. There is a concern at Port Allegany, near Bradford, Pa., that claims to be able to make glass tubes that will carry oil, and a 100-mile pipe line made of glass is said to be in successful operation in southeastern Ohio.

WHEN an investor has been induced by fraud to buy stock that has no adequate property security, he may have legal redress for the proven fraud without waiting for default in payment of interest or dividends, and the mere payment of interest is an unimportant factor in determining if the stock is what it was represented to be.

FOR cores for light castings, such as pump work, motors, valves and small cylinders, where the core is almost wholly surrounded by iron and the layer of metal is very thin, foundrymen say that white, or "sugar" sand, is best; if mixed with flour the proportion should be 20 sand to 1 flour; if resin is added, about 1 resin to 25 sand.

THERE are several electrically-driven centrifugal pumps. An example may be found at Bakersfield, Cal. It is understood that for constant speed the discharge of a centrifugal pump for any lift varies with the square root of the difference between the actual lift and the hydrostatic head created by the pump without discharge.

MUCH has been already said herein regarding "learning mining engineering or the science of mining through correspondence schools." Those schools are not without merit, and are not to be decried; doubtless one could learn to play the piano or run a bank the same way, but many men will follow the old way of oral instruction, accompanied by personal experience.

HOWEVER interesting from a laboratory standpoint liquid air may be, there is much exaggeration in the claims made for its commercial application, and serious attention is not to be given to projects "for using it as an explosive in mining." The slightest accession of heat occasions so rapid a return to its normal state as to preclude practical possibility of use in that way.

MILLMEN of experience think that it is rarely necessary that the stamp should weigh over 1000 pounds, and some look upon that weight as the maximum for efficiency. A lighter stamp with sufficiently higher drop to insure sufficient momentum is generally preferred. In this, as in everything else about a stamp mill, the ore is the thing to be suited. Whatever is best for the ore is the best to use. And this can only be determined by individual experiment.

MOST of the gold in the old copper plates may be extracted by heating the plates over a charcoal fire, placing the lower side of the plate next to the fire, heat to about boiling point of water, then remove it from the fire and scrape with a broad chisel. This will remove most of the gold and silver amalgam, which melt into a base bar. If the plates are very old and brittle by becoming saturated with quicksilver, the only method is to melt the entire plate and refine.

PROPER foundation is as necessary for a gas engine as for any other form of power application. In setting a horizontal gas engine there should be a slight slope longitudinally, downward, from the head end of the cylinder toward the crank; about ½ inch, in the length of the cylinder will suffice, this to cause a flow of the waste oil toward the open end of the cylinder. Otherwise its tendency is to settle at the head end, and this interferes with the working of valves and igniter.

IN dressing plates when well coated with amalgam it is the practice of many millmen not to stir clear to the bottom, where it is thickest. Washing with a hose and a slight stirring of the surface with a whisk broom dipped in the dressing mixture suffices to remove adhering dross. Thus a heavier coating of amalgam may be carried, in a manner similar to the usual treatment of a chuck block. In the final brushing little riffles are formed: and if it be done crosswise the channels fill up with sulphides. This interferes with the gold coming in contact with that portion of the plate surface, and it is therefore thought better to finish lengthwise.

A GOOD BELT DRESSING (liquid) for summer use is composed of beeswax 4 lbs., pitch 5 lbs., resin 3 lbs., neat's-foot oil 13 lbs. Melt the beeswax first and add the other ingredients in the order named. For winter use the neat's-foot oil should be increased to 15 lbs. If a solid dressing is required, for summer use—beeswax 6 lbs., pitch 5½ lbs., resin 7 lbs., neat's-foot oil, 1 lb.; for winter use make the resin 6½ lbs. The fluid dressing is the best, but more wasteful; the solid is more economical.

TO NOTE so small a quantity as .025 ounce gold to the ton of ore, place four ounces of finely pulverized ore in a bottle, add an equal volume of tincture of iodine and agitate the mixture for at least an hour, letting it occasionally settle. There should then be introduced into the clear solution a strip of Swedish filter paper and dried; the introduction of the strip and subsequent drying should be repeated six times, to saturate the paper thoroughly. Upon burning the strip, the ashes, in case gold is present, will show a purple coloration which will quickly disappear upon pouring bromine water over it, if gold be present—an indication of its presence.

THE results of measurements of various rivers and the observations of height have been published by the U. S. G. S., in a series of "Water Supply" papers, Nos. 35 to 39, inclusive, arbitrary division into five parts being necessary by the requirements of law limiting these papers to 100 pages each. They are as follows: No. 35 (Part I), "Rivers Flowing Into the Atlantic Ocean From Maine to Virginia;" No. 36 (Part II), "Rivers Flowing Into the Atlantic South of Virginia;" No. 37 (Part III), "Rivers Flowing From the Eastern Rocky Mountain Area; No. 38 (Part IV), "Rivers Tributary to the Colorado, the Interior Basin and Columbia River;" No. 39 (Part V), "California Streams and Rating Tables." Application for these papers should be made to Members of Congress, by whom 4000 copies of the 5000 printed are distributed, or to the Director U. S. Geological Survey, Washington, D. C.

CARBONS for electric arc lights are made from a coke which is a by-product of the process of petroleum refining, being the solid residuum left in the refining stills after the oils have been driven off. This material is calcined to drive off volatile matter, then ground and bolted to free it from coarse particles. In this condition it is almost pure carbon, and before being molded it is mixed with a binding material. Two processes are in use for molding the carbons. In the first they are molded under hydraulic pressure in split molds, eighteen or twenty carbons being molded at once. In the second method the material is forced through dies by means of heavy hydraulic presses, the carbons being molded in 4 or 5-foot lengths and afterward cut to the required size. They are then baked in kilns for eight or ten days, and afterward sorted and tested. In some cases the carbons are plated with copper by means of special machines.

ACETYLENE is one of those bodies the formation of which is attended with the disappearance of heat, and for this reason termed an endothermic compound, in contradistinction to those bodies which evolve heat in their formation, which are called exothermic. Such endothermic bodies are nearly always found to show considerable violence in their decomposition, as the heat of formation stored up within them is then liberated as sensible heat, and it is undoubtedly this property of acetylene gas which leads to its easy detonation by either heat or a shock from an explosion of fulminating mercury when in contact with it while under pressure. If acetylene be heated in contact with air to a temperature of 480° C. it ignites and burns with a flame, the appearance of which varies with the way in which the acetylene is brought in contact with the air. With the gas in access, a heavy lurid flame, emitting dense volumes of smoke, results, while if the gas be driven out in a sufficiently thin sheet it burns with a flame of intense brilliancy and almost perfect whiteness.

CYANIDE SOLUTION from a leaching tank contains free cyanide, caustic potash, gold potassium cyanide, silver potassium cyanide, and compounds of the baser metals. The gold and silver are precipitated from the solution by means of zinc shavings (and at Mercur, Utah, by zinc dust) as a blackish powder on the zinc. The zinc itself goes into the solution. During the process hydrogen gas is evolved. From five ounces to one pound of zinc is required for every ounce of gold recovered. In cleaning up the zinc box, the blackened, undecomposed shavings of the first box are transferred to an iron pan, the gold slime remaining on top of the screen is stirred to make it pass through, after which the screen is removed and washed. The cock at the bottom of the compartment is opened, and the slime settled there is drawn off in a bucket, where it again settles, after which the clear cyanide is decanted and returned to the zinc box. The collected slime is put on a filter, drained of cyanide, and washed with water. The slime consists of metallic gold, silver and copper precipitated from the cyanide. In refining the precipitates, they are placed in a cast iron pan, subjected to a dull red heat in a muffle furnace. Clean slime appears like a fine black mud. When the roast is complete the precipitate is treated with hydrochloric acid in pans having mechanical agitators. The residue is washed and dried in filters, fluxed and replaced in the roasting pan for drying, afterwards smelted into a bar and sent to the mint or U. S. assay office.

The Empire Mines, Past and Present.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE W. STARR, Resident Manager.

In 1878 the Empire Mining Co. was controlled by the estate of W. B. Bourn, the managers of which, after having the mine examined by three well known experts, concluded that it was worked out and too deep for profitable working, and were about to abandon the property when W. B. Bourn, Jr., returning from Europe, after an extended visit to Grass Valley decided to take over the management and formed a new company, called the Original Empire, which acquired all the assets of the old Empire Co. The shareholders of the Empire were invited to join, all declining except the late J. B. Fargo, who accepted, and his estate retains to-day the interest acquired by him in 1856. The reconstructed company took possession in 1879, shortly afterwards commencing pumping operations and soon resuming shaft sinking. Operations were conducted under the greatest difficulties, financial and otherwise, for this was a period when belief in California quartz mining was at its lowest ebb. Faith and energy triumphed, and in 1883 the old Empire entered a new era of prosperity. In 1884 water power was introduced at a cost of $100,000, the plant reconstructed and improved, and in 1886 the 20-stamp mill was increased to forty stamps.

MINING AND SCIENTIFIC PRESS

Drifting With Machine Drill, Empire Mine, Grass Valley, Nevada County, Cal.

It was the successful reopening of the Empire that inspired Mr. Bourn to purchase and reopen the North Star, one of the oldest properties in Grass Valley, and from the early '50s to 1870 a very large producer. In 1884 Mr. Bourn purchased the property from W. E. Dean, Thos. Bell, J. A. Faull and others for $16,000, formed a company with a working capital of $40,000, which, with an assessment of $20,000, and the profit of the mine, sufficed to thoroughly reopen and equip the property with what was in 1886 the model plant in California. The successful reopening of the Empire, followed by the wonderful results at the North Star, gave Grass Valley quartz mining an impetus that was felt throughout the State.

In 1887 Mr. Bourn and associates sold the control of the North Star to J. D. Hague and associates of New York, and in 1888, with an idea of retiring from mining, Mr. Bourn sold the control of the Empire and retired from active management.

My connection with the Empire commenced in December, 1881, succeeding to the superintendency on the resignation of V. M. Clement in 1887. In 1893, accepting a call to South Africa, I tendered my resignation, after expressing my faith in the property to the management with the hope that discouragement would not follow the splitting up of the Ophir ledge into several leaders at the 1700 level. (See lower engraving, front page, of split Ophir ledge.) Some exploitation work was carried on during the years 1892–93–94–95, but the mine did not pay expenses, and in 1896 the interest sold by Mr. Bourn was repurchased by him.

Shaft sinking was then resumed and the 1800, 2000 and 2100-foot drives or levels extended. In 1898, returning from South Africa, the management of the property being tendered me was accepted, after I had made a thorough examination and had prevailed upon the executive committee to adopt fixed plans and policies laid down in the report I submitted to them. The essence of this report is, in my opinion, applicable to gold mining generally in California. I found that by extending the drives my former theory of the split in the Ophir vein had been proved true, and that as soon as the large "horse" had been driven through the vein was as strong and true as ever. The 2100 north drive I found had penetrated a rich ore body which then had cut 540 feet of good ore. Good ore was in the face of the drive and the ground above was virgin to the surface, this drive being farther to the north than any of the old levels. Very large areas of north and south ground were unexplored. A probable valuable reserve was in a parallel vein known as the Rich Hill (which had not been worked since 1880), in other parallel veins and in extralateral rights. Lack of sufficient development was the chief cause of all underground troubles. The surface conditions were deplorable, the mine having outgrown the plant. As a condition of acceptance I asked for a fund of $200,000 to properly equip and open up the property, explaining that, while the proposed outlay would require that amount, it was probable that the actual outlay might be less if the old hoist and pumping plant would live long enough to allow mining and milling to continue. The executive committee did not think the ore in sight would justify such an expenditure. My answer to this was that I would admit no large quantity of ore was in sight, but that they controlled a property with a record of forty-seven years' continuous working, with a very limited area of its holdings exploited, a production of more than $7,000,000, with but a small percentage profit, the chief cause being lack of development and a plant not suited for economical or expeditious working under existing or future conditions, and that, in my opinion, the mine justified the expenditure. This letter soon followed:

SAN FRANCISCO, May 9, 1898.

Geo. W. Starr, Esq., The Empire Mines, Grass Valley—DEAR SIR: I have the pleasure to inform you that the executive committee have accepted your ideas and that you were this day appointed managing director by the board of directors. You will be given a free hand in the equipment and development of our property, with the understanding that if necessary to carry out your plans the sum of $200,000 will be furnished you, and that on the completion of the plant the necessary expenditure for 600 feet per month of development, consisting of shaft sinking and drives, will be allowed.

We sincerely trust that, including the cost of the above development, you will succeed in bringing all costs down to $7 per ton. Yours very truly,

(Signed) W. B. BOURN, President.

With the responsibility thus resting upon me, I concluded to first try and force underground development, with a result that far exceeded my expectations. The 2100 drive was rushed ahead and continued in good ore; the total length of this ore body along that level has since been found to be 1740 feet, raises above the 2000 level showed most encouraging results; shaft sinking was continued under difficulties. In the meanwhile plans and estimates were under way for a new plant and on July 6, 1898, the work of pulling down and reconstructing was commenced. All immediately necessary working parts were completed on January 7, 1899. It is interesting to note that this re-creation was accomplished without hanging up more than ten stamps at a time, and the change from the tracks of the old incline and hoist to the tracks of the new thirty-pound rails in shaft and on headgear was made in forty-two hours, during which time forty stamps were dropping. I had no occasion to call upon the company for expenditures, but had the pleasure of producing sufficient to not only pay for all improvements, but to give the shareholders a dividend.

(TO BE CONTINUED.)

Some Facts About Para Rubber.

It is reported that a new rubber producing area in the Amazon section, South America, recently discovered and as yet untouched, is larger than that now being worked. The State of Para produces about two-thirds of the rubber shipped from the port of that name, the remainder coming from the States of Amazonas, Peru and Bolivia.

The rubber tree in appearance resembles the English ash. It grows to a height of more than 60 feet. The leaves are trifoliate. Rubber trees thrive the best on islands and low ground near the rivers, where the banks are inundated. Ground that is above water at all times, or that has no drainage, is not suitable. The peculiarity of the rubber tree, the "hevea," is that it will not grow satisfactorily on cleared or open ground. It requires the shade of other trees and still air from the time its growth begins until it becomes an adult tree. Without these conditions the supply of milk or sap is much affected. The hevea requires about fifteen years to mature.

The area known to produce Para rubber amounts to 1,500,000 square miles. It is believed that further exploration will show that this area is underestimated. On the river Acre, one of the tributaries of the rives Purus, 200 trees yield as much as 3 tons of rubber a year. Great quantities of hevea are known to exist on the banks of the Japura, but that territory has not yet been opened.

It was at one time imagined that the excellence of Para rubber was largely due to the kind of fuel used in curing it. In the Amazon region the fuel used in a clay funnel consists generally of the nuts of certain palms. The reason these nuts are selected is because they emit a continuous dense smoke and are more portable than other obtainable fuel. The palms that furnish the fuel were at one time transplanted in Africa, with a view of making Para rubber there. The experiment was unsuccessful. When none of the palms is accessible bark and twigs are used as fuel.

All workmen in the forest carry a wood knife, the blade of which is 26 inches long and 2 inches broad. One of its principal uses is to cut the fuel for the preparation of rubber. Owing to the damp climate, the blades are electroplated to prevent their becoming rusty before they are marketed. The knives, which resemble the Cuban machete, are all imported from the United States. The rubber collector carries a small ax to chip a smooth surface on the bark before attaching a cup to the tree. The handling of the ax requires skill in order not to injure the bark. A smooth surface is made to prevent impurities mixing with the sap. The cups are clay or tin. The former are attached to the bark by means of a little clay.

Their weight, however, makes them inconvenient to carry when the trees to be tapped are far apart. The collector then prefers to carry tin cups. They easily penetrate the bark by means of the sharp edges and hold to the tree without the use of clay. The use of the tin cup, however, is said to be injurious to the tree.

Part of the collector's outfit consists of a light gourd—large enough to carry the contents of from 500 to 700 cups. A clay bowl is next required to receive the contents of the gourd, of sufficient size to contain the product of several days' work before it is cured. The calabash tree provides calabashes, which are employed to ladle the milk from the clay bowl into the mold. A broad-bladed wooden paddle is used as a mold and is made locally. This completes the outfit for the rubber collector.

The collector has to use his knife to cut his way through the undergrowth, and also to cut down a sapling occasionally to bridge a rivulet. At times he is knee-deep in ooze or up to his waist in water. On arrival at a rubber tree, he chips away the rough parts of the bark, makes a more or less smooth surface, attaches a cup, and makes a small gash above for the sap to fall into the cup, and repeats this process in a line around the tree until he has attached six or seven cups. Then he proceeds to the next tree and does the same. He continues this process until he has tapped from 75 to 150 trees, which can be done in a day if they are not too far apart. On the following days the gashes in the trees are made a trifle lower down than the first ones. Some collectors tap the trees in the morning and return to collect the sap in the evening, whereas others tap in the evening and collect in the morning. An expert gathers seven pounds daily in the lower Amazon; in the upper Amazon three times this amount is collected.

When the accumulation of rubber is sufficient—usually in three or four days—the collector lights a fire in the hut he has erected, places the funnel over a fire, pours a thin coat of milk over the paddle and holds it over the smoke to coagulate. The process is repeated until a large cake has been formed. To release the paddle from the cake it is necessary to make a slit on one side. The paddle mold makes a cake of uniform and even shape, and is in general use in the State of Para. In other parts, a spit is placed on two upright forked sticks and given a rotary motion. By this means the rubber is cured with greater ease. Paddle smoked rubber is preferred, as it is drier and seemingly more carefully cured.

Many attempts have been made to introduce improved curing apparatus. Up to this writing, however, they have not been received with popular favor, because the common method, although very primitive, possesses the advantages of being simple and inexpensive. The process of curing rubber is extremely injurious to the eyes. Many cases of total blindness result therefrom.

There are three grades of Para rubber, viz.: fine, medium and coarse. If rubber is not uniform and contains impurities, it is classified as medium. The coarse quality, or "Sernamby," consists of scraps that have not been cured.

Insufficient labor is the most serious difficulty in the rubber industry. It would scarcely seem advisable to invest money in rubber estates, unless the owner first can see his way clear to obtain sufficient labor with which to collect the rubber. In reality, the genuine owner of the produce of the forest is the collector, not the landowner.

As a rule, the landowner makes advances to the collectors for their outfit, food, etc., and in return receives the rubber collected by them. He sells the produce on the collector's account, retaining 20% for himself, and continues making advances in such manner that the collector always remains in his debt and consequently in his service. It frequently happens, however, that the collector takes the advance and fraudulently disposes of the rubber to any buyer who may be on hand. A great deal of leakage occurs in this way, and no method of preventing it is in successful practice. This is another of the difficulties of the landed proprietor. One of the methods in practice is to lease the trees in lots of 75, 150 or 200 at a given sum per annum, and to stipulate that the lessee should sell the rubber and purchase all his supplies from the owner. The lessee works his lot to the utmost, and usually earns a handsome profit after paying the rent, and, although the owner does not obtain the full value of the lots rented, he makes up for it by charging commission on goods supplied, etc.

The profits of the rubber industry would seem to be large, because the employer keeps 20% and makes about the same on the goods supplied the employes; but it must be considered that out of 100 employes, whose outfit and traveling expenses have been advanced, at least 75 die, desert, or return to their homes on account of illness. The expense incurred for them is accordingly a dead loss, and when this is deducted from the total income the profit is greatly reduced.

The "aviador" is a person who advances supplies and capital to the rubber collector in exchange for rubber. The principal "aviador" resides at the chief centers, and finances a number of small "aviadores," who travel about in the rubber industries. The exporters of rubber are mostly agents of United States and British importers. They buy from the "aviadores" in the principal centers.

Signal Device for Mines.*

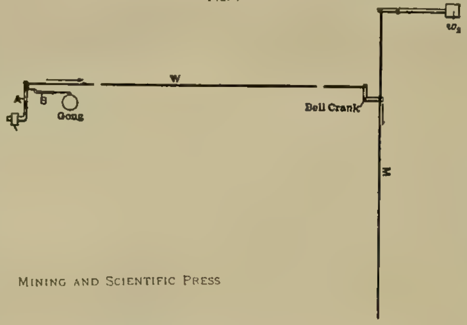
By C. S. Herzig.

Some time ago, in Mexico, our signal bells in a 700-foot shaft caused us considerable annoyance by continually getting out of order, each time so delaying our hoisting operations that we naturally desired to remedy this evil. There were two ways open: either to patch up the old bell, which was of the ordinary pattern, every time it failed to work, or else to devise some new arrangement. On consultation with our foreman we devised a signal device which, during the number of months I watched its operation, worked satisfactorily, without once getting out of order.

We sought to produce a simple device, in which no greater pull on the lever would be necessary from one level than from another; to counterbalance independently the weight of the pendant bell rope, so that there would be no direct weight on the working parts of the bell itself, and likewise to arrange it so as to necessitate only a light pull on the lever in signaling; and, finally, to make some sort of trip arrangement, so that whenever the signaling lever underground passed through a certain arc the signal would be given in the engine room. By this means we wished to obviate the ill effects of sudden heavy pulls and rough usage in general, such as all signaling systems encounter underground at the hands of careless or mischievous employes.

The bell rope we had in use was a galvanized iron rope $\frac{7}{32}$-inch in diameter; and, after determining the length needed, we calculated its weight, so that we might be able to counterbalance it properly. On locating the bell in the engine room, a wire, W, is led off horizontally, and, by means of a bell crank, is connected to the main signal rope, M, passing down the shaft (see Fig. 1). The weight w_2 counterbalances M and should be heavy enough to carry the wires back to a normal position; therefore, it must be equivalent to the weight of the pendant rope, M, plus a factor to overcome friction.

Fig. .

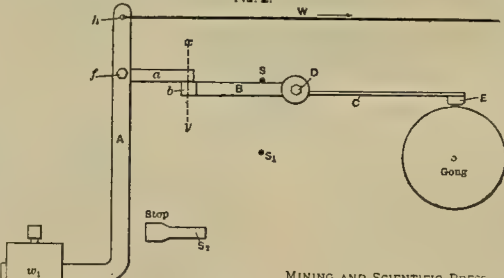


Mining and Scientific Press

DIAGRAM SHOWING GENERAL ARRANGEMENT AND CONNECTIONS OF SIGNAL AND METHOD OF COUNTERBALANCING PENDANT ROPE.

The working parts of the bell itself are shown in Fig. 2. A is a weighted lever, to the upper end of which the connecting wire W is attached; the arm a projecting from it is made of steel, about 5 inches long, and has a bearing surface of 1 inch at its further end, resting on a similar surface b on B. A cross-section through x y is shown in Fig. 3.

Fig. 2.



Mining and Scientific Press

SKETCH SHOWING DETAILS OF SIGNALLING DEVICE.
One-tenth full size.

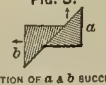
SECTION THROUGH x–y (FIG. 2.) a & b AT REST, READY FOR SIGNALLING.
½ full size.

Fig. 4.

a & b ENGAGING AFTER SIGNAL HAS BEEN GIVEN.
½ full size.

Fig. 5.



A POSITION OF a & b SUCCEEDING THAT SHOWN IN FIG. 4.
½ full size.

Mining and Scientific Press

B is a piece of flat spring steel about 8 inches long, at the end of which is the bearing surface b. D serves as a hub, to which B and C are attached, C being a flat spring similar to B, but about 12 to 14 inches long, at the end of which is the knocker E. It should be observed that B is vertical, whereas C lies flat, and that C should not be as heavy a spring as B.

When the bell rope is pulled to signal the engineer, the wire W moves in the direction of the arrow, and the arm a, traveling downward in a circular path, around f as a center, forces b to move downward around D as a center, until the arcs in which they are traveling diverge far enough for gravity to carry B–C back again to its normal position, B being arrested by the stop s; however, the force with which the arm flies back causes the knocker to strike the gong and thus give the signal. As soon as the bell rope is released, the arm A is carried back to its original position, and in so doing the triangular surface on the end of a slides upon the inverted triangle b (see Fig. 4), forcing it to one side (see Fig. 5), until a rests in its normal position on top of b, when it is ready for another pull, as shown in Fig. 3.

In counterbalancing the weight of the pendant bell rope, sufficient weight must be added to the counterbalance to bring the levers underground back into position automatically. The counterweight may be located at any convenient place on the headframe, providing it is above the bell crank to which W is attached.

In order to prevent the pull necessary for signaling from becoming excessive, it is desirable to reduce friction as much as possible. A force equivalent to a 10-pound weight should be sufficient for pulling the levers in a well arranged signaling system. To accomplish this, I think it advisable to bring a bell rope into proper alignment by means of plumb lines and to hold the rope in position by means of old iron pipe 2 to 3 inches long, instead of by means of staples, as is so commonly done. In inclined shafts the bell rope should be supported at frequent intervals on some form of roller. The spools on which connecting wire comes make good rollers, in the absence of anything better.

That there may be no mistake, the arm C should be long enough, and the knocker E heavy enough to cause their instant return to position when the paths of a and b part company. For this purpose it is also advisable to put a stop, s_1, below B, so that by no possible chance can it fly beyond its balance point.

By increasing or diminishing the bearing of the triangles a and b, the arc traveled can be changed. In my opinion, it is not advisable to increase this bearing above the inch mentioned before. The triangles, as shown in section, Fig. 3, should have bases of about ¾ inch, with perpendiculars of ¾ to 1 inch. The bearings of the two points f and d should be good ones, so that there will be no lateral motion, which might make a fail to engage properly with b. Any play at d or f is considerably magnified at the triangles; but, by making the bases of these triangles large enough, the chances of their not working properly are greatly lessened. By moving the position of h with respect to the center f, the arc of pull underground necessary to signal can be regulated.

The spring B must be quite stiff and of good material; but it must be borne in mind that the stiffer the spring the heavier must be the weight w_1, and, in consequence, the greater the effort required to pull the levers; nevertheless, w_1 must be heavy enough to bring back the wire W and to overcome the resistance of the spring B. If the arm A is made sufficiently heavy, the use of a counterweight (w_3) may be dispensed with, although it is preferable to arrange as shown in Fig. 2; for by this means it can be properly adjusted. If w_1 is too heavy, the arm A has a tendency to pound against the stop s_2. While w_1 must not be too heavy, its weight must not be cut down to such an extent as to impair the instant return to position of the arm A.

The whole apparatus may be mounted on a board and placed at some convenient spot in the engine room.

Saving the Copper.

To the Editor:—The following is clipped from a Utah paper:

> In Butte City the Anaconda Co. realizes thousands of dollars annually from the cupriferous waters by holding this water in tanks into which are plunged great quantities of scrap iron, etc. The iron is freed and a unit of copper deposited in its place. At the Mikado mine recently old pieces of submerged iron rails were found changed to copper on the same chemical principle. Might not the waters from those mines contain sufficient copper in solution to make the proposition worth testing?

The suggestion is a good one. The matter has been given trial in this camp. There is copper in the water below the mouth of the Starlus tunnel, at Bingham, and Mr. Lee, the manager, some time ago had made a series of small tanks; he filled them with scrap tin and ran the spring water through them, securing accumulation of precipitant. The water was clear, no discoloration being perceptible, but carried an average of one-fourth of 1% copper. Within twenty-four hours after the tin was immersed it showed precipitation which accumulated, sloughed off and sank. In seven to eight days the tin disappeared, being disintegrated by the action of natural sulphuric acid in the water. As a precipitating agent tin is superior to naked iron, not enough oxidization taking place to interfere with the process. The "plant" consisted of five tanks, each 18 feet long, 12x12 inches wide and deep, and one 4 feet long, 3 feet wide and 4 feet wide.

Bingham, Utah, Aug. 1. E. D. S.

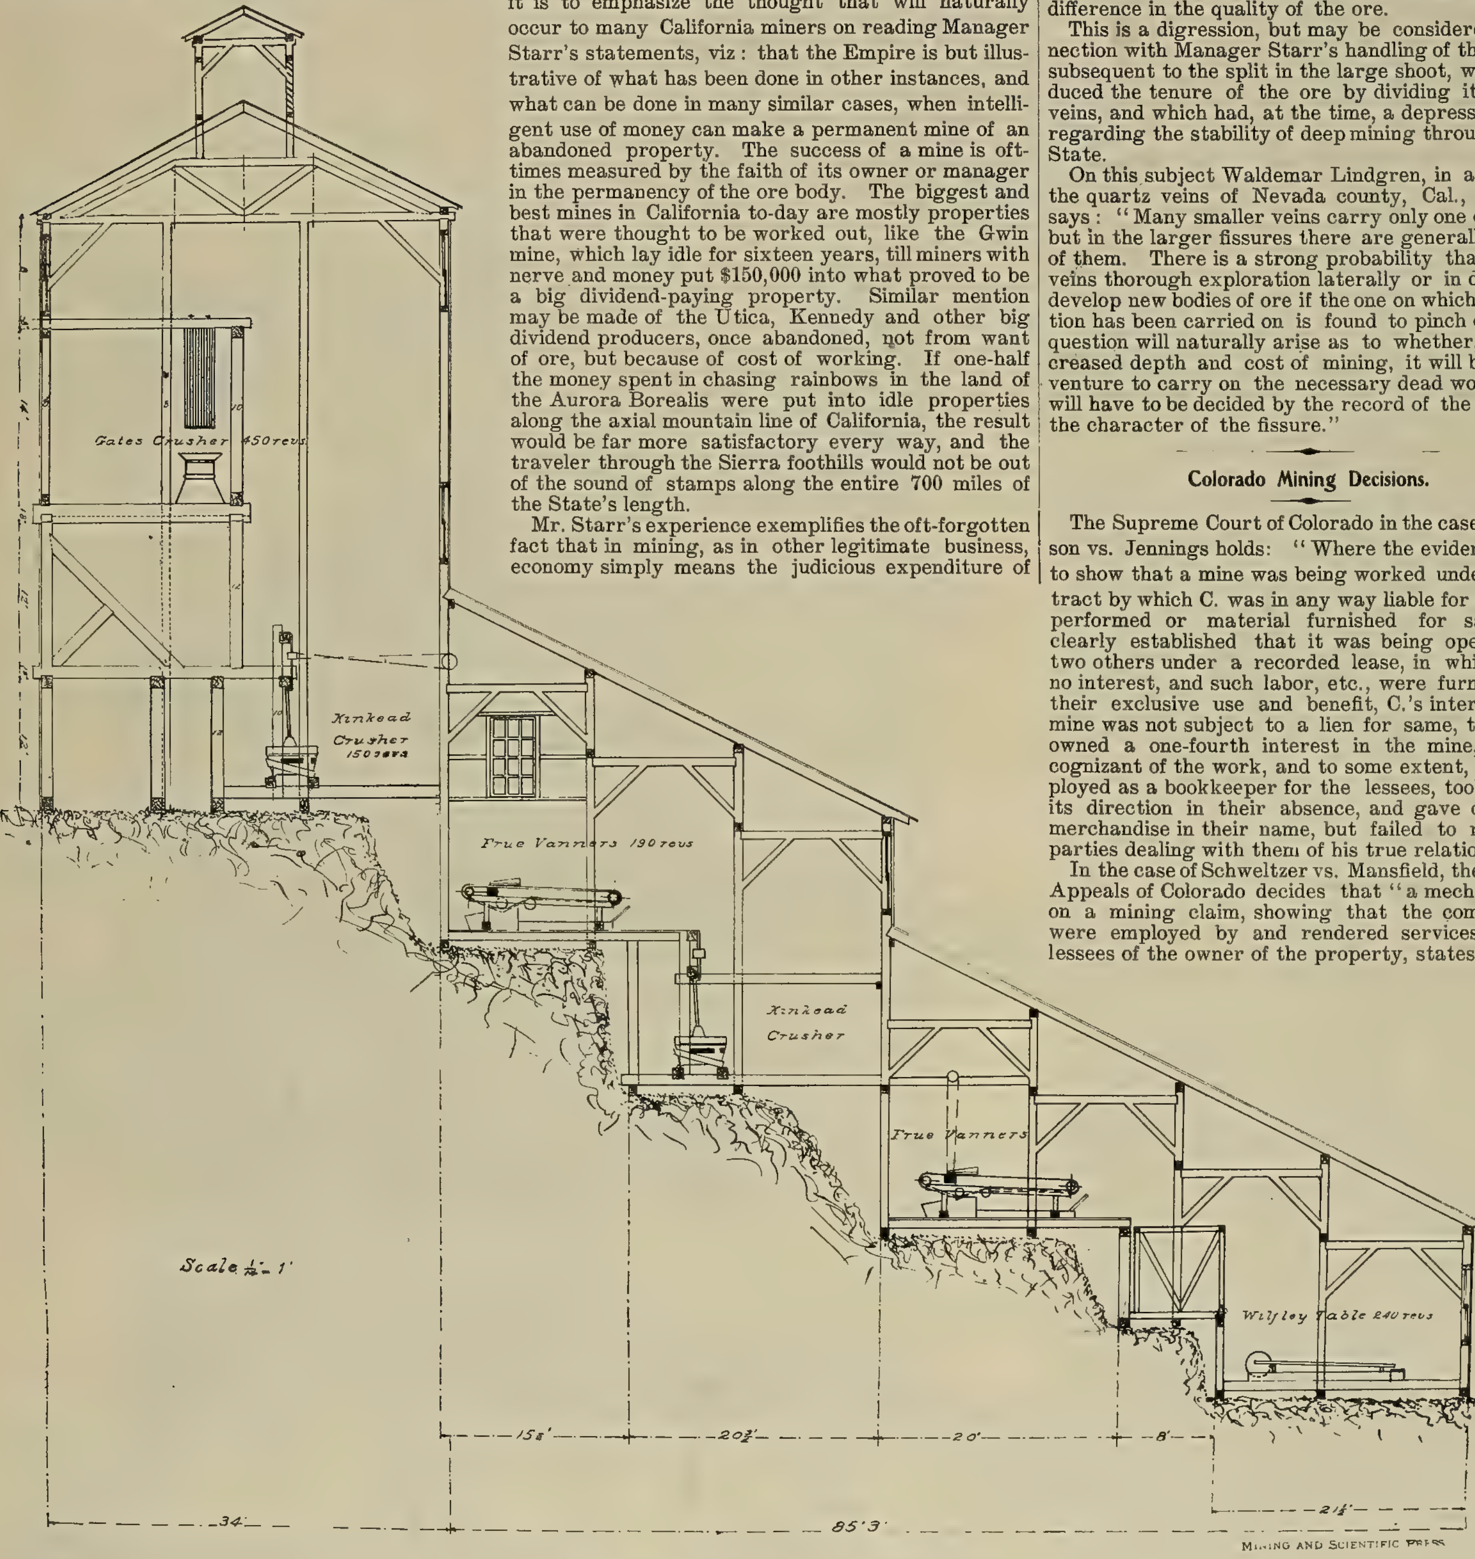
Gould & Curry Plant.

Among the new evidences of life on the Comstock, Nevada, is the new concentrating plant of the Gould & Curry, now nearing completion. The accompanying zincograph is from an official drawing furnished by Mr. Allan Kinkead, and reduced therefrom, the scale being proportionately reduced—one-fourteenth of an inch to the foot as it appears on this page. The engraving will convey to practical miners a better idea of the appearance and arrangement of the plant than a page of description.

The new concentrating plant being erected by the Gould & Curry G. M. Co. at Virginia, Nevada, will have a daily capacity of 100 tons. The ore will be run from the lower tunnel (425-foot level) and dumped over a grizzly into the mill bins, the coarse ore passing to a Gates rock breaker and broken to 2-inch mesh. On the first floor below the bins the ore passes to five heavy Kinkead mills where it is crushed through 20-mesh screens, sized and carried to Frue vanners on the second floor below the bins. The tailings from the first set of vanners are then carried to four Kinkead mills, located on the third floor below the bins, where they are reground through 60-mesh screens, sized and carried to the second set of vanners, located on the fourth floor below the bins. The slimes are then separated from the sand and run into a large V-shaped settling tank, 40 feet long, 10 feet wide at the top and 10 feet deep, from which the slimes are fed to the third set of vanners, located on the fifth floor below the bins. By this arrangement it is claimed that 90% of the values can be recovered by the one continuous operation. The mill will be driven by electric power transmitted from the Truckee river, a distance of 28 miles.



Gould & Curry Concentrating Plant, Virginia, Nevada.

A Good Example.

The article on pages 149 and 152 of this issue deserves notice, being a plain statement of past and existing conditions in the oldest continuously worked gold mine in the United States, written by a man fully familiar with the facts. The idea in referring to it is to emphasize the thought that will naturally occur to many California miners on reading Manager Starr's statements, viz: that the Empire is but illustrative of what has been done in other instances, and what can be done in many similar cases, when intelligent use of money can make a permanent mine of an abandoned property. The success of a mine is ofttimes measured by the faith of its owner or manager in the permanency of the ore body. The biggest and best mines in California to-day are mostly properties that were thought to be worked out, like the Gwin mine, which lay idle for sixteen years, till miners with nerve and money put $150,000 into what proved to be a big dividend-paying property. Similar mention may be made of the Utica, Kennedy and other big dividend producers, once abandoned, not from want of ore, but because of cost of working. If one-half the money spent in chasing rainbows in the land of the Aurora Borealis were put into idle properties along the axial mountain line of California, the result would be far more satisfactory every way, and the traveler through the Sierra foothills would not be out of the sound of stamps along the entire 700 miles of the State's length.

Mr. Starr's experience exemplifies the oft-forgotten fact that in mining, as in other legitimate business, economy simply means the judicious expenditure of money: it is economy in making a mine, as in making anything else of profit, to spend necessary money, and no form of industry brings surer or more permanent return.

The first part of the article in last week's issue related to the early history of the mine. In this week's installment of the article Mr. Starr makes reference to the split in the Ophir vein. His ability to prove that his theory regarding that split was correct, is of value and encouragement as concerning deep mining in California, and goes far towards favorable consideration of similar conditions.

It is occasionally the experience of miners that large bodies of ore pinch out with depth; the Sierra Buttes mine, in Sierra county, Cal., is an example; but it is a more common experience with large ore shoots that they continue to the deepest levels. In the same district as the Empire mine the ore shoot of the North Star extends 2500 feet in depth, measured along the plane of the vein; the Eureka–Idaho shoot held its own uniformly over a distance of 5000 feet; in the Maryland mine high-grade ore was found on the same shoot at a vertical depth of 1500 feet, and a small ore shoot was found near the bottom of the Idaho shaft at a depth of 2200 feet. Gold quartz veins in that vicinity show a vertical extension of 3500 feet, within which there is no evidence of any gradual change in the character or quality of the ore. In the same county, near Washington, good quartz is mined 600 feet below the river level in the Eagle Bird, and 2000 feet above the river level on the north ridges of the river; in that 2600 feet there being no distinct difference in the quality of the ore.

This is a digression, but may be considered in connection with Manager Starr's handling of the Empire subsequent to the split in the large shoot, which produced the tenure of the ore by dividing it on three veins, and which had, at the time, a depressing effect regarding the stability of deep mining throughout the State.

On this subject Waldemar Lindgren, in a work on the quartz veins of Nevada county, Cal., correctly says: "Many smaller veins carry only one ore shoot, but in the larger fissures there are generally several of them. There is a strong probability that in such veins thorough exploration laterally or in depth will develop new bodies of ore if the one on which exploitation has been carried on is found to pinch out. The question will naturally arise as to whether, with increased depth and cost of mining, it will be a good venture to carry on the necessary dead work. This will have to be decided by the record of the mine and the character of the fissure."

Colorado Mining Decisions.

The Supreme Court of Colorado in the case of Davidson vs. Jennings holds: "Where the evidence failed to show that a mine was being worked under a contract by which C. was in any way liable for the labor performed or material furnished for same, but clearly established that it was being operated by two others under a recorded lease, in which C. had no interest, and such labor, etc., were furnished for their exclusive use and benefit, C.'s interest in the mine was not subject to a lien for same, though he owned a one-fourth interest in the mine, and was cognizant of the work, and to some extent, while employed as a bookkeeper for the lessees, took part in its direction in their absence, and gave orders for merchandise in their name, but failed to notify the parties dealing with them of his true relation."

In the case of Schweltzer vs. Mansfield, the Court of Appeals of Colorado decides that "a mechanic's lien on a mining claim, showing that the complainants were employed by and rendered services for the lessees of the owner of the property, states no cause of action against the property."

The same court, in the case of the Little Veleria G. M. & M. Co., holds that "a complaint by miners to enforce a miner's lien against the owner of the mine, alleging that they had been employed by sublessee in accordance with the provisions of the original lease, and that their wages had not been paid, but failing to show that the owner of the claim was connected with the contracted employment, or in any manner obligated for the payment of their wages, is insufficient to hold him or his interest in the property."

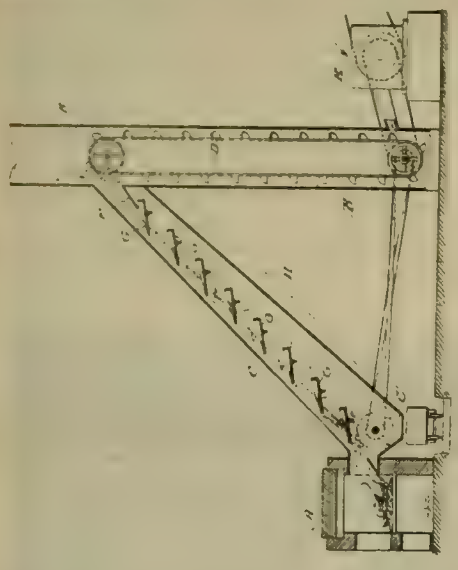
A SPECIAL MEETING of the executive committee of the California State Miners' Association will be held at the Union League rooms, San Francisco, Aug. 13, at 8 P. M.

Mining and Metallurgical Patents.

Patents Issued July 31, 1900.

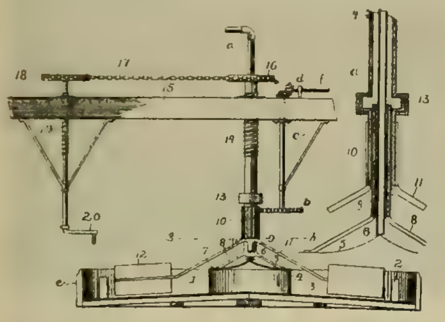
Specially Reported for the MINING AND SCIENTIFIC PRESS.

CALCINING FURNACE.—No. 654,640; G. Hughes, El Paso, Tex.



Combination of chute having slots J, dumping plates pivoted and provided with stop projections extending through slots, bearing rollers K and chain having tripping projections engaging bearing rollers. A roasting apparatus for roasting ore comprising in-lined series of dumping plates pivotally supported whereby discharge edges may be lifted and dropped, stop to limit dropping movement of dumping plates and chain provided with projections arranged to engage plates and lift and release discharge edges hereof, whereby they will drop upon their stops and ause roasted material to discharge.

ORE SEPARATING MACHINE.—No. 654,662; J. F. Mitchell, Topeka, Kansas.



Ore-separating machine comprising circular tank ith vertical discharge openings 2 in sides 1, gates which operate as vertically adjustable closures for ischarge openings 2, inclined bottom 3 to tank, cenral cylinder 4, having cone-shaped top 5, axle 9 restng on braces 8 attached to it, feed pipe a, elongated, ogged hub 10 turning on axle 9 and having arms 11 ttached to and radiating from near its base, fans 2 attached to arms 11 near outer extremities, screw 4 attached to top of hub 10 by swivel connection 13, ulley wheel 16 attached to upper end of screw 14, onnected by endless chain 17 or belt, to pulley wheel 8, supported by upright screw 19, terminating at wer end in handle 20 or crank, cog wheel b conected with hub 10 and attached to lower end of perendicular shaft c, which has cog connection d with orizontal shaft f supplying power.

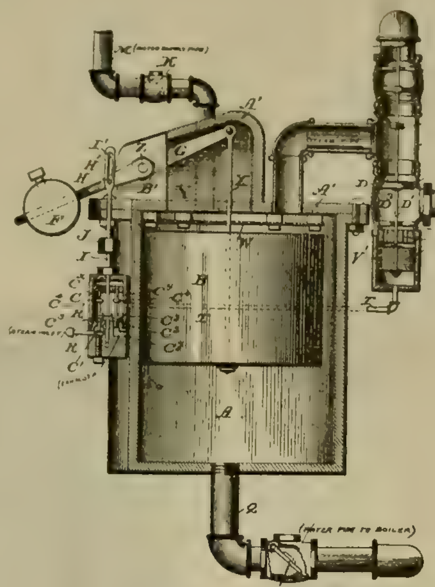
PROCESS OF MAKING BORAX.—No. 654,667; J. L. ovarine, New York, N. Y.

The process of manufacturing sodium borates, consting of following steps: first, reducing crude sodium ilphates at high temperature by means of caronaceous material, treating resulting mixture of odium compounds with water, subjecting natural orate to action of solution thus obtained, filtering or ecanting it off and isolating sodium borates therein ontained through repeated crystallizations.

PROCESS OF OBTAINING OXIDE AND CARBONATE OF INC FROM MATERIALS CONTAINING ZINC.—No. 654,-4; G. Rigg, Swansea, England.

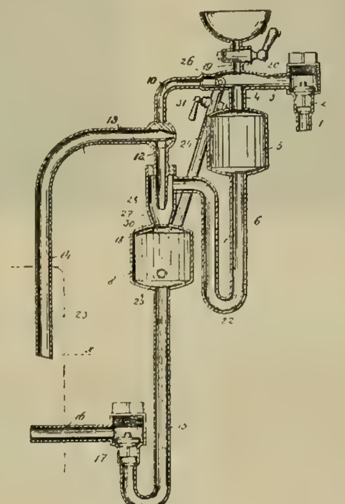
Producing or separating oxide of zinc and carbonate zinc from zinciferous ores or other materials, leachg zinciferous ore or other material with solution of nmonia and carbon dioxide wherein carbon dioxide in such proportion to ammonia as to impart to later an approximately maximum dissolving capacity id subsequently separating from solution oxide of ıc and carbonate of zinc contained therein by altering proportion of active carbon dioxide contained in solution, removing oxide of zinc and carbonate of zinc, and rendering solution fit for leaching again by again establishing proper proportion of carbon dioxide therein.

BOILER FEEDER.—No. 655,064; H. J. Davis, P. G. Ault, W. W. Bailey, J. H. Wideman, Birmingham, Ala.



In apparatus of character described, combination with tank connected with boiler and source of water supply, displacing weight adapted to rise and fall in boiler, rocking lever connected with weight, and adjustable governor or counterbalance weight applied to arm, valve chest, steam inlet valve C′, steam exhaust valve C^2 arranged in chest and provided with shoulder stems, slidable rod having lengthwise slot engaging pin on lever arm, provided with shoulder or collar within valve chest, adapted to engage shoulders on valve stems, steam pipes connecting chest with boiler, steam chest having admission and exhaust valves and piston for operating them.

SELF-ACTING FEED APPARATUS FOR BOILERS.—No. 654,784; A. Coufalik, Krepice, Austria.



Combination in self-acting boiler, condenser 8 located higher than water level in boiler, injector on boiler, water tank connected thereto, tank being situated higher than condenser; water supply pipe, pipe being interposed between same and tank, pipe 10 leading to injector, pipe 12 leading from boiler to pipe 10, cock in pipe controlling communication between pipes 10 and 13 and injector, pipe connection between bottom of condenser and boiler and valve in latter pipe.

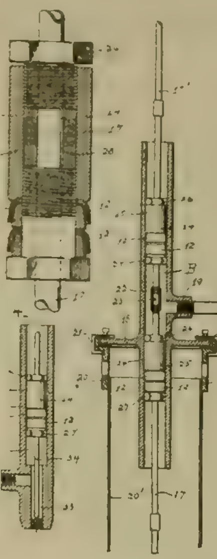
COMPOSITION FOR PREVENTING BOILER INCRUSTATIONS.—No. 655,119; J. L. M. A. Reis, Antwerp, Belgium.

Composition for preventing incrustations in steam boilers, consisting of 58 parts of sugar, 20 parts extract of tannin, 20 parts silicate, 2 parts boracic acid and water, sufficient to bind above ingredients.

GOLD SOLVENT FOR REFRACTORY ORES.—No. 654,-838; D. Mosher, San Francisco, Cal.

Process of treating refractory ores consisting in reducing ore to pulp, adding thereto solution of about 15 pounds of bromine in 120 pounds of commercial hydrochloric acid 21° Baume, then adding potassium permanganate in dry and crystal form to slowly generate chlorine, then precipitating the precious metals.

OIL WELL PUMP.—No. 654,706; H. E. Braymer, Prairie Depot, Ohio.



In an oil-well pump, combination of casing head top having barrel provided with lateral branch, packing head movable therein, and comprising tubular sleeve internally threaded at both ends, externally threaded plugs adapted to threaded engagement with ends of sleeve and provided with orifices to receive sucker rod, compressible cylindrical gland with sleeve around rod, interposed between plugs and adapted to be compressed thereby to frictionally secure sleeve to rod, and packing cups upon one of the plugs adapted to be compressed thereby against sleeve to pack barrel.

How to Find a Pocket.

Written by a Prospector.

First.—Remember that the gold in the surrounding surface is the only guide to a pocket.

Second.—Never dig a hole on a quartz ledge with the expectation of finding a pocket unless it will prospect at the start.

Third.—When tracing for a pocket, if the gold is smooth, leave it at once, for it's ten to one you will never find it.

Fourth.—If your trace runs to a deep bed of clay, don't lose much time in looking for the pocket.

Fifth.—Beware of serpentine traces. Most all will prospect and not pocket.

Sixth.—Remember fifteen or twenty colors of gold as fine as flour to the pan, and an occasional coarse color as big as a pinhead, is a better trace to a pocket than a single piece of gold worth $1, even if it is rough.

Seventh.—The best place to look for pockets is in a coarse-gold district. The pockets are larger and as easily found.

Eighth.—Recollect that nine out of ten pocket ledges do not crop out near the pocket.

TRACING.—Commence by panning the top of the ground. It will prospect better there than deeper, unless you are near the pocket or on flat ground. Then go deeper, even to the bedrock. If on descending ground, face up hill, panning from right to left as far out as you can get gold, and where you get the best prospect; move up the hill from that point, panning from right to left as before, and move up on the best prospect. Keep this up until you get above the prospects; then go back where you got the last best prospect, dig a small hole half way to the bedrock and take a pan. Then take one on the bedrock, and if the last prospects best, rest assured you are near the pocket. From there trench up, and if you don't find the ledge and prospects give out, trench across, and you will be certain to find the ledge; if you do not find the pocket, trench both ways along the ledge, panning every inch, and you will be certain to find it, unless it has been distributed over the ground you have traced by the rocks decaying and rain washes. Where a pocket throws out a trace, you will find it at the top of the bedrock, if there is any left.

When you have taken out one pocket, note the formation around it; follow that and you will be likely to find another or a dozen. It is not advisable to sink straight down very deep, unless it will prospect or the formation runs that way, which can be determined by black rock, caused by fine stringers of iron and quartz running towards the ledge; where they strike the ledge, pockets are liable to occur.

Pocket chimneys—like those on the mother lode or any gold-bearing region—do not run straight down, but angle on the ledge. Pocket shoots are often not more than 1 foot wide, and even less. By the time your shaft is down 8 or 10 feet, you will have cut through your shoot and left it on the end of your shaft. The same system described to find pockets holds good in locating chimneys on milling lodes, if they contain free gold or even gold-bearing sulphurets.

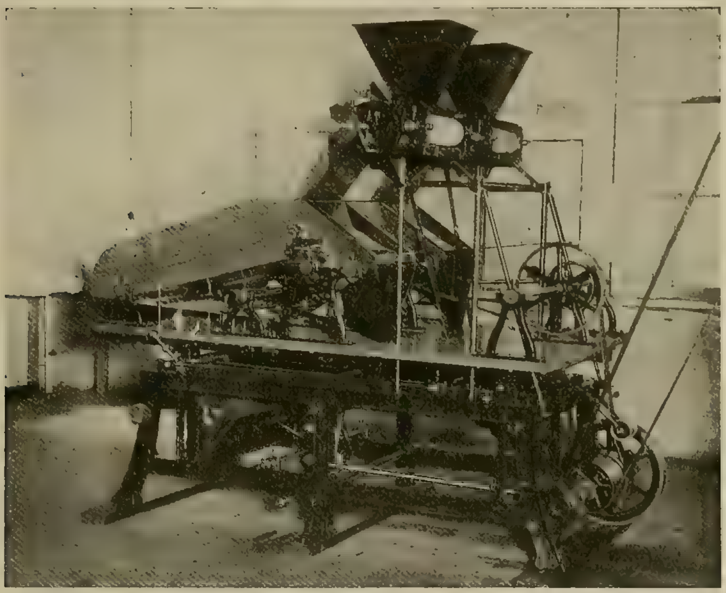
New Concentrating System.

Mine and mill managers, dealing with ores which require concentration, are often harassed in their efforts to secure concentrates of the greatest possible purity and carrying the highest attainable ore values at least possible cost of extraction, if, when the profitable point of extraction and purity has been reached, values still remain in the tailings which if in the mine treasury would insure a handsome profit. In the majority of mining operations the margin between profit and loss is a narrow one, and this passing away of values is a source of worry.

More particularly does the above apply to those who destructively handle gold ores which, in addition to their free gold, carry auriferous metallic sulphides of zinc, antimony, lead, iron, arsenic, copper, etc., sometimes singly, often containing a combination of two or more, all of which slime readily under the impact of a stamp; and especially the more friable ones, as of zinc and antimony.

In no branch of the mining industry has a greater degree of intelligent thought and inventive genius been brought to bear than in that involving the concentration of ores, and the mine owner heartily welcomes any suggestion or device which will enable him to ever so slightly and profitably increase his percentage of values saved.

The Crown dry ore sizer and concentrator, illustrations of which appear on this page, have been especially designed to secure a larger percentage of values. In these machines are embodied the practical results of long continued and expensive tests on the part of the inventor, F. W. Wood, based upon the proper application of the following principles:



Concentrator.

First.—That bodies of unequal sizes, but equal falling weights, will fall together.

Second.—That bodies of equal sizes, but unequal falling weights, will not fall together.

Third.—That the influence of specific gravity upon a falling body increases or decreases proportionally to the density of the medium traversed by the body.

Fourth.—That all mineral particles, however finely divided, will, in falling, if of equal size and left free to act, arrange themselves in accordance with their specific gravities.

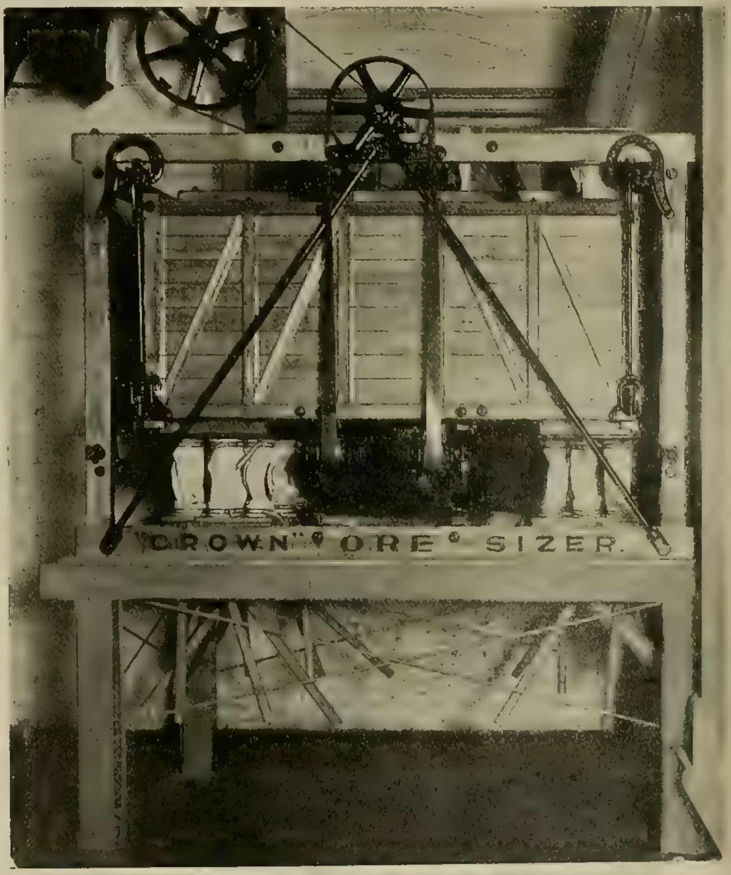
In the Crown dry ore milling process the ore is first passed through the rock breaker, thence through a series of rolls gauged to give pulp of the desired fineness and without grinding or crushing the sulphides to a sliming powder. The pulped ore is conveyed by a carrier belt to the "sizer," which consists of a dust-tight box containing screens of from 40 to 180 mesh (the mesh sizes can be varied to suit particular ores). By a simple mechanism and small expenditure of power the sizer is given a rapid oscillatory motion, and each screen discharges its special sized grains into a separate bin. An automatic attachment takes assay samples from the separate discharges at regular intervals. In the sizer the ore particles have been rearranged and classified from:

First.—Bodies having unequal sizes, but equal falling weights, into—

Second.—Bodies having equal sizes, but unequal falling weights.

From the sizer bins the assorted particles are taken to the concentrators by carrier belts, the sized grains being concentrated separately; but all of the concentrates are delivered into one receptacle, and all of the waste is discharged into one dump, unless for any reason it is desired to keep the sizes segregated.

The concentrator consists of a woven corrugated belt, traveling through a closed box having an air chamber under the superior portion of the belt. The concentrator box is fastened to a shaking table to which is given a compound motion to keep the ore particles actively vibrating on the belt, and is designed to insure perfect concentration. The concentrator belt travels equal distances in equal times, an accompanying device being intended to eliminate all slippage. The travel of the belt can be quickly varied and the table elevated or depressed, as may be best suited to obtain the most profitable results from the different sized ore grains being concentrated. At the head or elevated end of the concentrator is placed a blower which discharges itself horizontally into the air chamber under the corrugated belt. This air pressure may be regulated from an ounce to the smallest fraction thereof to each square inch of belt surface, as may be found to be most suitable to the gravity and size of the ore grains. The air pressure can relieve itself only through the interstices of the woven belt, running at an angle of about 15°, the horizontal air column strikes it at an acute angle, and, passing through the belt, deflects the slower moving, light and worthless grains from the perpendicular, causing them to travel toward the lower or waste discharge. The heavier and valuable particles, being unaffected by the air current, are carried by the belt to the upper or concentrate discharge. As the influence of specific gravity acts more freely in the rarified medium—air—than in the denser medium—water—satisfactory concentration is designed to be effected, the finest particles being recovered.



Sizer.

The manufacturers are of the belief that the sulphides saved will be from 95% to 98½% of the total quantity contained in the ore, even though such sulphides should have the greatest tendency to slime. They also claim that in purity or freedom from worthless matter the concentrates will reach 90% to 95%. Any system of rolling or crushing will leave some grains of matrix with adherent particles of sulphides or free gold, which pass over into the concentrates, and, to this extent, debase the product.

Numerous assays indicate that, with some exceptions, the valuable contents of ores worked will be found in a well-defined series of classified particles. In some ores these values will be in the coarser series; in other ores they will be found in the finer series, and in still other ores in the intermediate series. As assay tests are taken at the sizer, only those sizes carrying value are put through the concentrator. The worthless sizes are consigned to the waste dump, there being, then, a large amount of material upon which no further expense is incurred.

The manufacturers say "that among the sizes showing values it will be found that one or more of these carry the bulk of the sulphides, while the other sizes will carry the largest percentage of free gold in ores. Those sizes carrying free gold can be treated either before or after concentration—preferably after—and a larger value recovered than if treated while associated with the sulphides; and the loss of free gold floated away by the slimes, or the loss of mercury and amalgam by being scoured, sickened or floured and carried off in the tailings, is reduced almost to zero."

They claim that the Crown sizer and concentrator can be profitably attached to most mills now in operation. In the complete process the general practice is reversed, in that the ore is worked for the free gold—if the tailings show any—after, instead of before, concentration.

"The ores are handled automatically from breaker to waste dumps. A limited personal supervision only is necessary to attend to the details of stopping, starting and regulating machinery and concentrator, air currents, feeds, elevation and action. The feeds are designed to be so adjusted that precision and uniformity are assured. When the machines are in action all floating dust particles are absorbed by a dust collector, much to the comfort of the millman and the increased longevity and cleanliness of the machinery. Compared with their tonnage capacity, the machines require but a small area under cover and but a moderate expenditure of power. All swinging points are ball bearing and other bearings are dust proof."

If all that is claimed by the manufacturers be true, the sizer and concentrator should prove of value to those operating milling plants in arid regions, where the water supply is scarce, impure or expensive.

The manufacturers say: "In putting beach and river sands through the machines the separation of gold and black sand grains from the siliceous particles was so perfect as to leave nothing to be desired but a higher value in the crude sands."

They also claim that "from dry placer gravel sands all but a very small fraction of the gold is redeemed." It has ordinarily been found impossible to economically extract the finer gold particles from dry placer sands.

Further claim is made that "where pulps charged with cupriferous pyrites or metallic copper particles have been treated by this process the tailings have proved barren when assayed."

The machines are manufactured and operated by the Crown Gold Milling Co. at their factory, 23 Stevenson street, San Francisco, where they can be seen in operation and may be subjected to any desired test. The office of the company is at 230 Post street, San Francisco, Cal.

THIS time it is smelting that is to be "revolutionized." A company in New York is reported to be operating on a small scale a new process for the manufacture of oxygen, by which with the assistance of liquid air and an apparatus which can be placed on the stack of a smelter, oxygen can be made at a low cost. Then it is sprayed over the coke in a furnace, and one ton of coke, it is claimed, can be made to do the work of three tons, so hugely is the work of combustion aided by the added oxygen.

"As to the recent advance, so welcome to our Province's silver-lead production, the New York MINING AND SCIENTIFIC PRESS speaks as follows:" * * —Vancouver, B. C., News-Advertiser.

Silver Smelting in Mexico

NUMBER III.

All water jackets have a projection 4 inches above their tops in the center. This projection is open on top and has a circular hole in front in which the waste water pipe is inserted. The feed-water pipe is inserted through the open top and reaches about half way down in the projection. Some metallurgical authors insist that the coldest water should be introduced at the bottom of the jackets. I am of a different opinion. The feed water is kept near, but below, the boiling point.

The height of the water jackets is 41 inches in the case of the large size (42″x120″) furnaces, and 54 inches in that of the smaller-sized (42″x102″). Such high jackets are unwieldy to handle; the former are, therefore, preferable.

The width of the side jackets of the large furnaces is 20 inches, that of the smaller is 17 inches; hence, the length of the furnace section can be easily obtained by multiplying the width of the side jackets by their number.

The front and back jackets are 27 and 34 inches wide at the bottom, respectively, and 37 inches wide at the top. The front jackets are made 10 inches shorter at the bottom than the back jackets, in order to be able to place a slag tap (slag notch or tap jacket) on the dam under them. The slag tap is a small water jacket of cast iron, or, better, of bronze, 26 inches long by 14 inches high, with 3½ inches of water space, and a conical hole cored out in the center, which has a diameter of 2½ inches toward the interior of the surface and 5 inches outside. Through this hole the slag is tapped. The jackets of the larger furnaces have a bosh of 6 inches (or an angle of 74½° from the horizontal) all around, thus making the section of the furnaces above the water jackets 54x132 inches. Likewise have the jackets of the smaller furnaces a bosh of 9 inches all around (or an angle of 73½° from the horizontal), affording an area of 60x120 inches above the jackets. A flatter bosh is to be avoided.

The front and back jackets are not set between the side jackets, but lean or butt against them on the outside, and are wide enough to cover the narrow ends of the side jackets. They are held together by means of 1-inch bolts passing through wedge-shaped washers (wedge blocks), which are inserted in lugs cast on the jackets. This arrangement allows contraction and expansion of bolts without breaking off the lugs. Where blast of a high pressure is used, extra binders must be laid around the jackets.

By giving the smaller furnaces the same number of tuyeres as the large ones, namely, twelve, it was thought that they could be made to smelt the same number of charges as the larger ones. Ordinarily, this was not the case.

Cast iron water jackets are preferably used by lead smelters on account of their cheapness and the ease with which they can be handled. They are especially of advantage when the water is bad, for, if one breaks, there is not much lost, and it is an easy matter to replace it. This is different with wrought iron and steel jackets. As the sections cannot be fitted so snugly as cast iron ones, it is customary to make the whole side of a furnace one water jacket, to avoid too many joints. With bad water, they do not last much longer than cast iron, and it is then quite troublesome, and involves a great loss of time to replace leakly ones.

Good cast iron jackets can, however, not be made by any founder; it requires a great deal of experience and care, a fact which the Colorado founders, who now turn out the best work, have found out long ago. The water jackets made by the local foundry at Monterey were worthless, both on account of the quality of the iron and the uneven thickness of the castings.

It is a strange fact that I never saw a cast iron water jacket in a copper smelter; they use wrought iron or rolled steel plate altogether. At the Heinze smelter, Butte, Montana, cast iron jackets are used.

Cast steel jackets, if such are made, cannot be trusted, as the castings frequently contain air holes, which give rise to leakage.

The shaft of the furnace with the chimney surmounting it is built of red brick, with an interior lining of refractory brick, and rests on four hollow cast iron columns, weighing about 800 pounds each. There are three methods in use to support the shaft:—

First, a cast iron mantle frame is bolted on the caps of the columns, and brick arches are thrown across from column to column on which the upper masonry rests, the space between mantle frame and arch being also filled out with brickwork.

Secondly, a framework of three parallel I-beams bolted together is fastened to the tops of the columns, and cast iron deck plates of the width of the masonry are bolted to the I-beams; on these deck plates arches are sprung the same as before, and on these the upper masonry rests.

Thirdly, cast iron shoes, having the shape of skewbacks, are fastened to the tops of the columns and held together by two stout cords or tension rods with screwed ends, and from these shoes the arches are built up. This latter plan has been put in practice at the Germania Lead Works, Utah, by the Denver Engineering Works, and seems to be a good one if the arches do not get distorted by variations in temperature.

The two first plans I have tried myself, and I do not know now which is the worse of the two. Both have their bad sides. The I-beams are much affected by the radiated heat of the furnaces, and after along use get out shape with corresponding injury to the masonry. Therefore I discarded them. On the other hand, the cast iron mantle frames are subject to corrosion by the smelting material, and are liable to be cracked by the heat, in which case their function becomes unsafe.

The furnaces at smelter No. 3 were, however, all provided with mantle frames after rebuilding.

The furnace walls are in most cases too thin; they consist of 18 inches of red brick externally, and 9 inches of firebrick lining internally. This lining rests on the few courses of firebrick intervening between jackets and mantle frame. To afford more solidity to the brickwork, the firebricks should be tied at every third or fourth course with the red brick. The shaft is bound by heavy tension rods, running through cast iron angle pieces, at every foot up to the charge floor, above that at greater distances.

The shaft is carried up straight to about 6 or 7 feet above the charge floor, leaving spacious doors in the long sides, and then contracts gradually to the size of the chimney. The doors are not directly opposite one another, but diagonally, in order to prevent the feeders from throwing the charge all in one place. The doorsill is about 9 inches above the charge floor, to compel the feeder to shovel in the charge and not scrape or push it in.

The effective height of the smelting column, that is, the distance between the centers of the tuyeres and the charge doorsill, is between 13 feet 10½ inches and 14 feet 1 inch. The original furnaces had a higher smelting column, but the filling up with slag in front of the furnace building to a higher level than the furnace floor caused the rainwater to flood it in the wet season, and necessitated the raising of the hearths above the high-water mark. This was done without raising the charge floor, hence the loss in height.

The down-comer or down-take is carried from an opening in the back wall of the chimney into the flue underneath the back part of the charge floor, and behind the furnaces, in the same manner as at smelter No. 2. The flue runs parallel to the back end of the furnaces some distance beyond the furnace building proper, then turns a rectangle, and connects with a brick chimney 130 feet high. The discharge openings of the flue through which the dust is raked out are in the side opposite the one running through the furnace shed, and are facing the ore bed shed. The main blast pipe is carried overhead from the engine room through the passage into the furnace shed along the rear of the furnaces to the farthest one, where it makes connection with the reserve blower. The blast main is tapped for joining on the distributing or bustle pipe opposite the center line of each furnace. In the connection between the main pipe and the bustle pipe a gate valve (blast gate) is inserted, for turning on, lowering, or shutting off the blast. This arrangement repeats itself in every American smelter. Corresponding to the tuyeres, there are stubs attached to the bottom of the bustle pipe, which are connected with the tuyere pipes or nozzles by means of a stout canvas hose (16-ounce duck), made air-tight by being soaked in raw linseed oil and dried. Galvanized tuyere pipes have been abolished on account of their frail construction; the patented forms of tuyere pipes are too complicated for the simple-minded people of the country; and cast iron ones are too heavy and clumsy. So a tuyere pipe of cast steel has been adopted, which is similar in construction to the Davies tuyere pipe made by Fraser & Chalmers. It has a 2-inch slag escape at the bottom, threaded inside, and ordinarily closed by screwing in a wooden plug, and a detachable cap with a peep-hole at the back. The mouth fits over a sleeve against the shoulder of a steel thimble or bushing that is inserted into the tuyere opening and made airtight by packing with asbestos paper or even clay mortar. This thimble, which, in reality, might be called a tuyere, is 3½ inches diameter at its mouth.

Brass would be the proper material for these devices if it were not coveted so much by petty thieves. The water is distributed to the furnaces in a similar manner as the blast. The main pipe is conducted overhead from the water tank along the front of the furnaces, and at each furnace is tapped for joining on the feed pipe, which is of reduced section. It is not sufficient to provide water for the jackets only, but there must be extra nipples with rubber hose attached to the feed pipe in case of accident. Water should of necessity be plentiful about a furnace.

Adjoining to and connected with the furnace shed is the bullion shed, is which six broad gauge cars may be placed to load bullion on. Annexed to one side of this bullion shed is another shed containing the bullion remelting plant, for short called the "refinery," in which all the furnace bullion is melted over again, and the impurities are skimmed off. The plant consists of two cast iron kettles or pots, 6 feet 4 inches in diameter, and 36 inches deep, with a common iron smokestack between them.

(TO BE CONTINUED.)

New Metallurgical Process.

The current number of the Engineering Magazine has extended notice of Dr. Goldschmit's new method of welding rails, in which he makes use of the great heat developed by aluminum when it combines with oxygen furnished by a metallic oxide. In the process of welding which he uses at present, the ends of the rails are brought together in a crucible, in which is then placed a quantity of finely divided aluminum and iron ore. The rails, previously planed at the ends, are pressed together tightly and the mixture ignited; the heat produced is sufficient to make a good weld, the more so as the high temperature causes an expansion of the rails and brings them firmly together.

When aluminum and oxygen enter into chemical combination, there is evolved a higher temperature than can be generated in any other artificial way except by electric methods. For a long time this fact was not generally recognized, partly because aluminum was more or less of a chemical curiosity and its production was confined to the laboratory; but of recent years, since it has become an important technical product, its properties have been more widely investigated and new facts concerning it discovered.

The work of Dr. Hans Goldschmidt in this field has laid the foundation for an important new industry, to which the name of "Aluminothermie" has been given. This term covers, in general, those processes in which high temperatures are produced by the combination of oxygen and aluminum, and various developments of Dr. Goldschmidt's inventions are described by him in a recent issue of Gluckauf.

The chemical reactions involved, says the Engineering Magazine, are very simple. Oxygen is not taken from the air, but is used as combined with the metals in the form of metallic oxides. As an example, take iron oxide, of common occurrence in nature as some of the iron ores. If metallic aluminum, finely divided, be mixed with a powdered iron ore and a reaction made to take place, the resulting products will be aluminum oxide and metallic iron, and at the same time a very high temperature will be evolved.

The problem has been to start the reaction. Most of these mixtures of metallic oxides and aluminum will burn only at high temperatures. They could be stirred with a glowing rod without any combustion taking place. The application of external heat would not answer, because the heat which would cause the mixture to burn would damage the crucible containing it.

A solution of the difficulty was reached when it was found that there is a class of oxides, which, when mixed with aluminum, are easily ignited at a low temperature, and after ignition evolve very high temperatures. It is only necessary, then, to sprinkle an easily inflammable mixture, such as barium superoxide and aluminum, on the refractory one, and then light the former, which can be done most easily with a large match. The kindling mixture will burn and generate a high temperature, and so set the main mixture on fire. More of the latter can be added from time to time, as desired, and will react with the evolution of as high temperatures as the combustion of the first portion generated.

There is thus afforded an extremely convenient means of obtaining great heating effects at any place, without the use of machinery or any complicated apparatus. The temperatures resulting from the reactions described can only be estimated, as there are no means of determining them exactly, but they are considerably over 2000° C.

The practical applications of this process already embrace wide limits. A direct result of the chemical reactions is the separation of the metals from their oxides in a pure state. The combinations take place in a regular way, according to chemical laws, but the mixtures are always made with an excess of oxide, so that all the aluminum will be oxidized and no metallic aluminum left to form alloys with the other metals.

The process is applied with special advantage to metals which it has not before been possible to isolate completely, but which now can be separated in an entirely pure state, free from even carbon. Among such metals, one of the most important in a metallurgical way is chromium. Almost all the chromium which has heretofore been used in steel metallurgy contains a considerable percentage of carbon, and is to be regarded as chromium carbide. All the chrome steels are, therefore, strictly speaking, chromium carbide steels, and have their properties materially influenced by the combined carbon. But it is now possible with the pure chromium to form steel alloys whose properties are decidedly different from the old chrome steels, and which can also be made to contain larger percentages of chromium.

In the same way pure manganese is produced, which finds a wide application in the making of manganese bronzes, free from iron, and, also, in special manganese steels. This pure manganese possesses the desirable property of not disintegrating on exposure to the air, as does the ordinary carboniferous manganese, and it also particularly distinguishes itself by its easy formation of alloys with molten copper, tin, zinc and other metals. Copper alloys containing 20, 30, 50 and even higher percentages of manganese are formed with extreme ease by the pure manganese.

Among other metals of growing importance in metallurgy which are prepared by this process may be mentioned titanium and boron.

A most important bye-product is the melted aluminum oxide, which is formed simultaneously with the separation of the pure metals. This product is really an artificial corundum and has been called "corubin." It is distinguished by its great hardness, and for grinding and polishing purposes far surpasses natural corundum and emery.

But perhaps the most important practical application which is made of this process is in welding. For this purpose there is used a mixture called "thermit," consisting essentially of iron oxide and aluminum, which is kindled by one of the easily burning mixtures previously described, and burns with the evolution of great heat in a specially prepared crucible made of corubin, magnesia, or some other very refractory material. The surfaces of the parts which are to be welded are carefully cleaned and polished, and pressed together by a framework with screws. A mold is placed around the joint and into it is poured the fluid mass from the crucible. The heat and pressure do the rest. In the crucible, before pouring, there are two strata. The lower consists of fluid iron and the upper one of the lighter melted aluminum oxide. When the pouring begins, the alumina which first flows into the mold quickly cools and forms a thin layer on its inner walls as well as on the pieces which are being welded. The rest of the alumina and all the iron remain fluid for a short time in the mold. In consequence of the solid coating of alumina, the molten iron does not touch the surfaces of the mold and the welded piece, and when the whole mass has cooled down, it can be removed by a couple of light hammer blows. The welded piece has not been deformed by the attachment of any fused iron, and the mold is not injured and can be used repeatedly.

By many experiments it has been carefully determined just how much of the heating mixture is necessary for a weld of a given size, and what the capacity of the mold must be. In this way it is possible to know beforehand the amount of heat required for a weld. This is an advantage which no other welding process possesses, as these are all based on empirical methods and require an experienced eye and hand to be carried out successfully. The new process can be applied by ordinary workmen, after a very little practice. Another advantage of the new method is that the heat is concentrated just at the place where it is needed.

This process is particularly applicable to rails of electric railways and to pipes for steam, gas and water, as these can all be welded in any position and at the places where they are in use.

The molten iron can also be used to repair defective or broken parts, by casting it right onto the original piece and working it into proper shape after cooling.

Only a few of the leading applications of this process have here been given, but there are enough to show that it bids fair to mark a distinct advance in metallurgical fields.

Notes on the Occurrence of Platinum in North America.

By DR. DAVID T. DAY, Chief of the Division of Mineral Resources, U. S. Geological Survey.

In the summer of 1898 demand suddenly arose for commercial quantities of the element osmium. At least half a ton was wanted for initiating a new incandescent light. This led the writer to examine as many localities as possible where platinum had been reported, to determine whether osmiridium was contained in the crude platinum. With the co-operation of the firm most interested, the Welsbach Light Co., and in company with its president, Colonel William Barrows, I visited most of the localities where platinum has proved plentiful. I also wrote to every available placer mine in the West for samples of the heaviest sands, in order to test them for platinum.

The references to the occurrence of platinum in this country as given in scientific journals include two interesting observations in the East. One is of a nugget described by Peter Collier of Washington, D. C. (Am. Jour. Sci., 1881, Vol. 21, p. 123), said to have been found on land adjacent to the village of Plattsburgh, New York. It weighed 104.4 grammes and contained sufficient chromite to reduce the specific gravity from 17.35 for the heaviest portion to 10.446 for the average of the nugget. The nugget gave "unmistakable evidence of osmium."

Messrs. William E. Hidden and J. H. Pratt have (Am. Jour. Sci., 1898, Vol. 6, pp. 381 and 467) found sperrylite—platinum arsenide—in placers in several points in the Cowee valley of North Carolina. The conditions tend to the belief that the source of this rock is a ledge of impure rhodolite and biotite containing much of disseminated iron sulphides—conditions much like those at Sudbury, Canada. In spite of unsubstantiated reports of platinum occurring in place in certain specific locations in the Catskills in New York, and in granite near Philadelphia, and again near Port Deposit, Maryland, the only localities where platinum is known to occur in North America, otherwise than as a mineral curiosity, are California, Oregon and British Columbia.

As early as 1852 Prof. W. P. Blake called attention to the existence of platinum at Port Orford, on the Oregon coast (Am. Jour. Sci., Second Series, Vol. 18, p. 156, and Vol. 22, p. 8), and noted that the platinum equaled from 10% to 30% of gold. This article seems to be the original source of the statement that the proportion of platinum to gold increased northward. B. Silliman (Am. Jour. Sci., Third Series, Vol. 6, p. 132), in his mineralogic notes on California, etc., extended our knowledge to the occurrence of platinum in the older deep placers worked by the hydraulic process in Butte county. He also notes the occurrence of iridosmine with the platinum.

The various notes concerning the finding of platinum on the Pacific coast have been well summarized in the publication of the California State Mineralogist and show that platinum has been found at many places on the Pacific beach from as far south as Santa Barbara county northward to the mouth of the Columbia. Indefinite reports have been made of its occurrence farther north on the Washington beach, but the amount is certainly not great. The principal beaches where platinum has been reported are: Beginning at the south, Santa Barbara, Lompoc, the beaches of San Luis Obispo county, Santa Cruz, and occasionally between Santa Cruz and the Golden Gate. In accordance with Blake's statement the richest beaches are farther north, in Humboldt and Del Norte counties. The beach mines of Gold Bluff, north of Arcata, Big Lagoon, Stone Lagoon, Little River, Crescent City, and at Gold Beach and Port Orford, in Coos county, Oregon, have all yielded platinum in more than experimental quantities. Still farther north platinum is found at Yaquina Beach, Oregon, but the sands are poor. Port Orford has proven, perhaps, the richest beach. Sharpless and Winchell have made an unusually careful examination of the sands at Brandon, on the Oregon beach. They almost invariably found platinum, but the proportion was not so encouraging as with less careful workers. All of this beach platinum is discouragingly fine and difficult to save.

Most of the platinum product has come from inland mines, where the platinum is comparatively coarse. It has become well known in the placers of the American river, and in Plumas, Shasta, Trinity and Siskiyou counties, California. The Bee Gum district, in Shasta county, the Hay Fork district, in Trinity county, and along the Trinity from Chapman's mine, north of Junction City, north beyond North Fork, are most promising.

While platinum metals are so frequently found in many of the gold placers in the region including Trinity, Shasta and Siskiyou counties, this is by no means universally true. There seems, for example, to be no platinum in the Weaverville placers on the Trinity. The platinum-bearing placers confirm the generally accepted idea that the platinum originates in the serpentine rock in which this county abounds, for the platinum gravels are sure to be closely associated with some prominent serpentine ridge. Nevertheless, no platinum has yet been found in place in that region.

A hurried trip through this region enabled the writer to learn—by the analytical aid of Dr. Waldron Sharpleigh—that in the Bee Gum district of Shasta county, at Hay Fork and at Chapman's mine, on the Trinity, osmiridium makes up, perhaps, the greater part of the mixture of platinum metals. At Chapman's mine Colonel Barrows obtained thirty ounces of small nuggets, averaging $\frac{1}{8}$ inch in diameter, which seemed altogether too hard for platinum, and yet, in very much larger grains than is usual for osmiridium, which has the habit of occurring in very small scales. Dr. Sharpleigh has shown that these nuggets yield a small amount of platinum on treatment with aqua regia, and then fall apart in the ordinary scales of osmiridium. Dr. Sharpleigh has found that the Pacific beach platinum often contains more than 90% of osmiridium. This is a sufficient reason why so little effort has been made to mine platinum, for until recently this osmiridium has been of practically no value.

At the time of this visit platinum was also noticed in the placers near Grant's Pass, Oregon, and by examining great numbers of black sands traces of platinum were found in the Snake river from Barkersville to Lewston, and in a sand reported from Miles City, Montana.*

In examining the well-known platinum localities on Granite creek near its junction with the Tulameen Fork, in British Columbia, it was estimated that the placers contained about one-fifth as much platinum as gold. I could get no test for osmium, but Dr. Hoffman of the Canadian Geological Survey has found samples of platinum yielding as high as 25%, and on the average about 10%, of osmiridium.

In further search for the platinum metals the writer collected heavy sands from the placer mines in California, Oregon, Washington, Idaho, Montana and Alaska. These samples averaged four pounds in weight. The sand was first separated by ordinary assay sieve into nine sizes, coarser than 20-mesh, through 20, 40, 60, 80, 100, 120, 160 and then 200-mesh. Each size was then in good condition for easy separation of the very magnetic portion by a rude form of separator. By limiting the magnetic separation to the very magnetic particles very little gold or platinum was found on panning the magnetic portions. By panning each size and then counting the flakes of gold and platinum, or weighing where the amount was considerable, a fair idea of the proportion of platinum to gold was obtained. As the sieving was carried to such uniform sizes, it was possible by counting weighed amounts to estimate the unit weights of flakes of the different sizes, and thus to approximate roughly the total weight of gold and platinum obtained.

A number of concentrates collected by Mr. A. H. Brooks of the Geological Survey from the Tanana river district in Alaska, and also the beach sands from Cape Nome, by Messrs. Brooks and Schrader, showed no platinum.

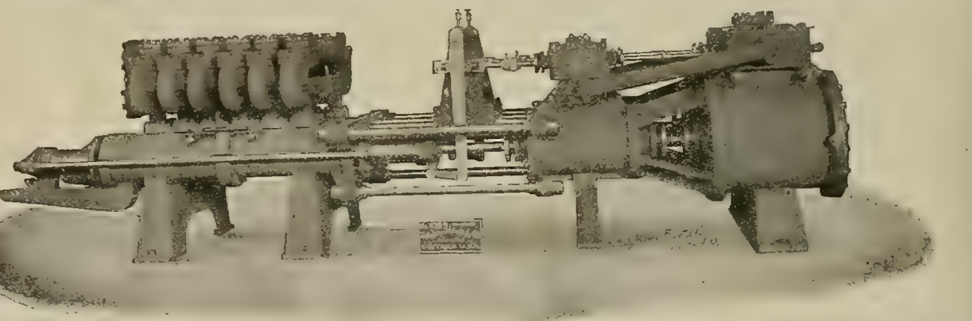
The total result shows that if all the sands examined were considered together there would be about half as much of platinum metals as of gold.

May's Gold Extraction Process.

From the explanation of the process given by the officials of the company, it appears that the ore, after being crushed, is exposed to the action of a solution of caustic alkalis or alkaline carbonates (used either separately or mixed) contained in specially designed vats, the solution being heated by waste steam, and is kept in a state of agitation, which is effected either by the rotation or the internal mechanical arrangement of the vats. The period required for treatment is said to be from one to three hours, according to the rebellious nature of the ore. By this means the extraction of the total gold contents from refractory ores is facilitated, and a large proportion of the precious metal, which would otherwise be irrecoverable, is saved. The ores, slimes, etc., after being subjected to the action of the chemicals, are then ready for amalgamation and are run off in the amalgamator into the settler. The amalgam is collected at intervals and passed through the clean-up pan, and is then ready for retorting and separation of the metal in the ordinary manner, the residues passing into a pit. It is claimed that the entire process is continuous, the time required being but from eight to ten hours from the first operation to the extraction of the gold and silver. It was stated that the average cost is only 2s. 6d. per ton of ore treated.—London Mining Journal.

Compound Duplex Pressure Pump for Mines.

The illustration herewith is for a compound duplex pressure pump to develop a maximum pressure of 700 pounds per square inch. The liquid end is of the end-packed trombone style, the cylinders being made of special metal. Mounted thereupon are separate chambers for the location of the valves; chambers are also constructed of special metal and designed with a view of facilitating quick access for the inspection of the valves. The valves are of the hydraulic pattern, made of steel and guided from below. An extension piece is provided for supporting the water plunger, and an approved adjustment device provided therefor. The water end is mounted on heavy supporting columns. An engine of the transposed cylinder type is furnished, giving free access to all steam pistons without dismantling the pump. The outside valve adjustment is a feature of this design. Further particulars regarding this style of pump may be obtained by addressing the manufacturers, The Stilwell-Bierce & Smith-Vaile Co., 276 Lehman St., Dayton, Ohio, U. S. A.



---

*Dr. F. W. Traphagen confirms this find of platinum at Miles City, Mont. The concentrated sand examined by him contained 10% of platinum.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—This is and promises to be an unusually dry season. No rains yet, though it is cloudy. This is keeping back the creek mining, many of the creeks and gulches being dry ones. But little is doing on Dexter creek for this reason, water being hauled in barrels for the little rocking that is done there. The territory comprised in Anvil, Dexter, Snow Gulch and the creeks which in that immediate vicinity proved rich last year, are practically the only ones that are being worked with much activity or with paying results, though much prospecting of other streams is going on. Hundreds of men have packed horses and prospected 100 miles inland from here, all returning with the same story—nothing of value found. But one party of six, just arrived, claim to have found ground that pays well on a gulch 100 miles from here, $140 being taken in two pans. The beach is being very actively worked by both machines and rocker men. There are 120 machines or pumping plants between Snake and Renny rivers. This is ground that also proved rich last year—is the only beach ground of much value this year, and will be thoroughly worked out by the close of the season. At Topkok a small strip of beach proved rich and a few thousand dollars taken out, and the gulch leading down to it, comprising some three or four locations, is said to be very rich. It is noticeable the "sour dough" men, or old timers, are themselves doing but little work on the beach, many of them appearing half sick and lifeless, but still "staying by the country."

In town, building is still going on actively. The rush and boom are over; prices are becoming more reasonable. Pipes are being laid for a water supply for the town. Mr. Chas. D. Lane's railroad is making good progress toward Anvil Creek.

The postoffice, under the management of Inspector Jno. P. Clum, is and has for some time been doing excellent service, employing a large number of clerks and working night shifts when large mails arrive and having a free delivery system for the town. The building is still very inadequate, the Department having no funds for this purpose.

Nome, July 18.

The July report from the Alaska-Treadwell mine showed 36,681 tons of ore crushed in twenty-seven days by 300 stamps, yielding $45,037; 668 tons sulphurets saved, value $22,063; gross returns $72,288; ore averaged $1.83 per ton. The expenses for the month were $26,605.

H. E. Hoggatt, Supt. Julian M. Co., Berner's Bay, says he will sink 500 feet, drift on the ore and raise to the present levels. A ten-drill compressor has been ordered.

ARIZONA.

COCHISE COUNTY.

R. R. Harper has bonded to English parties a group of wolframite claims in the Dragoon mountains, 13 miles from Benson. A concentrating plant will be provided.

COCONINO COUNTY.

Near Williams the Niack M. Co. is in charge of all the mining properties at that point of the Grand canyon. There have been fourteen cars shipped to El Paso during the past month under the supervision of Mr. Helme. There are thirty men employed.

GILA COUNTY.

Supt. Cook of the United Globe Mines has returned from New York. A new double compartment shaft is to be sunk.

MARICOPA COUNTY.

A dredger is being put in the river at Box canyon above Wickenburg, by B. C. Redlon. There are 30 miles of river there thought worth working.

G. W. Middleton, at the Groom property, Black Rock district, has a bond and is doing development work. He is down 350 feet.

Devine Bros., Sunset, Harqua Hala mountains, have bought the Prangy mill and will run on ore from their copper and gold property. They intend to put in a concentrator to save the copper, which will be shipped to a smelter.

PIMA COUNTY.

The Hardshell mine, 12 miles from Crittenden, is a lead-silver property. The company has a mill; water is piped from Harshaw, 1 mile distant; the incline shaft is down 300 feet. The ore is brought up from the shaft in cars operated by a steam hoist. From this point the ore is hauled to the mill, where it is broken and put through the crusher. About forty tons of ore are run through daily and eight tons of concentrates produced, shipped to El Paso. J. C. Smith is Gen. Supt.

YAVAPAI COUNTY.

The tanks and machinery for large cyanide plant at the Copper Chief mine, formerly the Equator, near Jerome, are in place.

G. W. Hull has bought the interest of Ralph Dillon in the Jerome Copper Co., and will put men to work to drive the 1000-foot tunnel another 1000 feet into the mountain.

The Verde Queen M. Co., at Jerome, has the main shaft down 240 feet, and has started to drift north from the 140 and 240-foot levels. Dr. King is superintendent of the smelter.

YUMA COUNTY.

Devine, Mulford, Winsor & Smith have sold 2000 acres of dredge land to the Crosby-Ehrich Co. of Colorado Springs, who are building a dredge, capacity 2000 yards, at a cost of about $40,000 on the banks of the Colorado in Yuma. It will be towed up the river by steam to Pot Holes, where, by Oct. 20, it will be in operation. The company has men at work prospecting with a drilling machine, with the view of building other dredges. A number of other companies have acquired dredge and hydraulic lands along the Colorado, extending 30 miles up stream.

E. A. Clark is foreman of the Crown Point mine, where twenty men keep the 10-stamp mill running.

CALIFORNIA.

AMADOR COUNTY.

A. J. Crain, Supt. of Lane & Hayward ditch, Cosumnes river to Plymouth, shut off the water on the 10th to set men cleaning out and repairing the ditches so as to make the main carry from 2000 to 2500 inches of water.

Dispatch: At the Peerless mine Supt. Osborne has the shaft down 365 feet.——J. Simcich is opening the Amica Stella mine, 9 miles west of Jackson, on the Mokelumne river, running a tunnel into the mountain from the level of the river, and expects to strike the lead at a distance of 500 feet from the mouth of the tunnel, and at a depth of 500 feet below the croppings of the ledge.——Tangerman & Ehlers are running a tunnel on the James mine, Clinton. It is in 320 feet.——The Oneida mine is expected to start up the first of September.——At the Kirkwood mine the upraise has a length of 60 feet. Preparations are being made for sinking.

BUTTE COUNTY.

The ditch and flume that will bring water from Cherokee to the Banner mine are completed, except a tunnel 200 feet long that is being run through solid rock.

CALAVERAS COUNTY.

Chronicle: Driving the main tunnel on the French Hill quartz mine is progressing under the management of T. E. McSorley. The main tunnel is in 639 feet, exposing a vein averaging 6 feet wide. The walls stand at an angle of 65°. The filling with the quartz is of black slate, with gouge on either wall, all of which carries a high percentage of sulphurets.——The pumps at the Vorlander mine at Middle Bar have been taken out and work suspended on account of the shortage of water for power.——Work on the dam at Horseshoe Bend, above Robinson's Ferry, to divert the waters of the Stanislaus into the flume of the Melones Con. M. Co., is resumed.

EL DORADO COUNTY.

Stingle & Loughry have bought the Gold Queen quartz mine, Kelsey district.

The Kimble mine near Placerville employs thirty-one men.

The Columbus Development Co. has levied an assessment, No. 1, 3½ cents per share, delinquent Sept. 17. The company has been developing the Columbus quartz mine, Cold Springs Flat, three miles west of Placerville.

At the Ribbon Rock mine three 8-hour shifts are driving tunnels north and south from the 200-foot level.

The Crystal mine, Shingle Springs, has been sold to Woodruff and Mau, who will put in a 5-pan Huntington mill.

HUMBOLDT COUNTY.

Reports are that, near Petrolia, oil is struck at a depth of about 1300 feet. The oil from Mattole is reported to have a paraffine base. All the land in the Mattole and Petrolia district, comprising 40,000 acres, has been scripped or located. Four companies are now boring and more are expected.

INYO COUNTY.

W. W. Bowsell is Supt. Lane mine at Darwin.

Work on the antimony mines bought by Montgomery & Dineen will begin September 1st.

The Tribune says Salt Lake men are sampling the group of mines at Darwin belonging to the estate of the late P. Reddy, with a view to purchase.

KERN COUNTY.

The Revenue Oil Co. at Kern river reports well No. 5 in section 4, 29-28, down over 800 feet, with 500 feet of oil sand.

To Aug. 1 nearly 350 oil companies have filed articles of incorporation in the county.

Bakersfield Californian: The fullers earth mill, on the Santa Fe reservation, is turning out five tons per day. The raw material is mined north of Poso creek, 14 miles from here.

LOS ANGELES COUNTY.

New Century Oil Co. is reported to have found the white oil streak at Newhall at 360 feet and at a depth of 400 feet, the bailer bringing up oil.

MARIPOSA COUNTY.

The Pumpkin mine at Coulterville, J. J. Dolan Supt., is to be worked.

The Nameless M. Co. at White's gulch has begun a dam across the Merced river. A tramway has been built from the mine to the Merced river, one-half mile in length. Thirty men are employed.

The Mariposa grant people are figuring with Capt. A. H. Ward on his electric power plant and property.

MONO COUNTY.

The Arnot Co. will operate a 10-stamp mill at Green Creek. Eighteen men are taking out ore.

In the Standard Con. mine, Bodie, the latest report shows 393.7 tons of ore were crushed during the week; average assay and vanner tailings, $11.11; concentrates produced, 1.23 tons; assay value, $101.78; plate amalgam produced, 1279 troy ounces; assay value per ounce, $3.12.

Pratt & Simonis will put a stamp mill on the Green Creek mine.

At the Castle Peak mine chlorination works and a new assay office are being built.

W. E. Lindsey has sold in San Francisco his Antelope marble quarry for $25,000.

NEVADA COUNTY.

Nearly all the men at the Providence mine are laid off. Supt. McKinlay is in San Francisco conferring with the company as to future work.

The elevator and derrick erected by the company that intends to work the Yuba river at Missouri Bar, French Corral, is finished, and the company is now ready to wash gravel.

R. Phillips will develop the Tres Robles mine taken by the Seal Rock G. M. S. of New Jersey. A contract has been let for an incline shaft 200 feet.

At Grass Valley suit is brought by the Pennsylvania Con. G. M. Co. against the Grass Valley Exploration Co. The complaint alleges that the defendant and its grantors have sunk an incline shaft upon land east of the Pennsylvania mine, the shaft being part of the W. Y. O. D. mine. The plaintiffs claim that within the past two years the defendants have by means of shafts, levels and stopes, and particularly in the 800 and 900 stopes, illegally intersected veins and ledges which have their tops or apexes within the lines of the Pennsylvania M. Co. It is claimed that the defendants have unlawfully taken out and converted to their own use 30,000 tons of rock valued at $600,000. The Pennsylvania M. Co. asks that $600,000 and the costs of the suit be awarded them as judgment for the damages sustained; that the W. Y. O. D. mine workers be enjoined from entering ground alleged to be the property of the Pennsylvania Co., and that by final judgment of the court the defendants be enjoined from trespassing.

The Grass Valley Exploration Co., defendant, has filed a cross suit on virtually the same grounds.

The Reward G. M. Co. has levied an assessment of 2 cents per share, delinquent Sept. 3.

E. E. Stark will install electric power at the Reward mine.

PLACER COUNTY.

Colfax Sentinel: The Tadpole Con. G. M. Co., 80,000 shares, $20,000, W. H. Cass, secretary, will work a gravel channel 4 miles east of Westville.

Coffin & Gray will work the Big Spring mine, Texas ridge, main north fork American river.

At the Turkey Hill mine the B. & S. D. M. Co., Wm. Muir, Supt., will put in a $50,000 electric plant.

L. D. Butts, 9 miles north of Cisco, will erect a mill on his properties. The mill site has been cleared and a ditch for water supply finished. The ditch is 1800 feet in length, 1000 feet of which is flume.

At the Lloyd quartz mine, 8 miles south of Blue canyon, the new main tunnel is 160 feet.

The tunnel at the Azalea mine, Blue canyon, is in 2640 feet. The company calls for one cent per share a month on the stock, which provides $400 each month.

Twenty-six men are employed at the Lost Emigrant mine near Cisco.

PLUMAS COUNTY.

Twenty-three men are employed by A. B. Chambers at the Bloomer Hill mill.

The Twelve-Mile Bar, formerly the Hyde mine, employs twelve men, G. W. Gaberel, manager.

The Rich Bar mine is being worked under the superintendency of J. W. Gray.

The Kellogg mine, on Kellogg ravine, is employing thirty-two men; F. Von Leicht, Supt.

RIVERSIDE COUNTY.

At the Gold King mine Supt. Johnson is running a crosscut tunnel to tap the main lead at a depth of 200 feet. The ledge is 4 feet wide between granite walls, with a streak of porphyry on the hanging side. The vein matter is talc, in which are bunches of hematite iron, and in this iron is found the gold.

SACRAMENTO COUNTY.

Near Folsom Drew & Cohn are putting men at work on their river bed mine at Salmon Falls. The section of the river to be worked has been dammed, and a centrifugal pump set up.

SAN BERNARDINO COUNTY.

The Puente Oil Co. owns wells in the Puente oil field and the refinery at Chino, the only refinery in southern California in which illuminating oil is made. The company turned out during July 5000 gallons per day of illuminating oil, gasoline and engine distillate. The oil is of so volatile a nature as to be too explosive to make the best of fuel, and the refinery makes it possible to take out the volatile portion in the form of distillates and leave the residuum for fuel use. The Standard Oil Co. takes all the refined oil produced at a stipulated price and distributes it, it being claimed that it is first mixed with Eastern oil. The oil refined by the Puente Oil Co. is taken from its own wells in the Puente field, and it is piped by gravity to the refinery.

At Gold mountain water is developed through an artesian bore at Bear lake, 2 miles from the mine. A flow of 14 inches is considered enough for forty stamps. The well was put down 150 feet in the bed of the ancient lake and at that point the water gushed. The mill will be started up next week.

SHASTA COUNTY.

(Special Correspondence).—About two years ago the Brown Bear people commenced a lower level to tap their ore chutes at a depth of about 360 feet below the present workings. They have been at this work with power drills and have advanced over 4000 feet at this writing. They expect to reach the first ore chute some time next month. That they have confidence in the result of the work is shown by their having already commenced the erection of a new 10-stamp steam mill, placed below the mouth of the new crosscut. This will also necessitate building new boarding-houses, offices, stores, etc., near the new mill—in fact, will move the entire town of Deadwood some 2 miles below its present location.

At the Niagara, a sale of the property is pending, and on that account little work is being done by the company, although a considerable amount is being carried on by lessees who are scattered over the whole property, engaged partly in exploratory work and also in working through and stoping on the old pillars and deposits left in the original work.

At the Washington the work is all being done by lessees, who are meeting with good results.

The same can be said of the Milkmaid property.

The Rossi property, opposite the Niagara, is being developed by the owner with a small force; good bodies of fair-grade ore are being opened up and blocked out.

The Gladstone property, which had been in litigation for some time, has now been straightened out and was recently sold to Roberts, McIntosh & Jillson of the Harrison Gulch and Siskiyou Co. properties, who intend commencing active exploration work. D. J. Sullivan will be the superintendent.

The American property is working a small force under the management of W. Irwin of New York, a part owner. They are fixing up the mill, preparatory to starting up.

French Gulch, Aug. 7.

On his recent visit to the Bully Hill group, accompanied by Manager Cohen, Captain De Lamar directed that the site of the projected smelter be removed to the banks of the Pitt river, that its capacity be enlarged, and that a railway be built for the transportation of the ores a distance of 4 miles between the Bully Hill mines and the plant.

Ex-Senator Warner Miller of New York has another bond on the Uncle Sam mine, Backbone district.

Courier: M. T. Hill is sinking a shaft on the Electric Light mine at Lower Springs, southeast of Shasta.

SIERRA COUNTY.

At the Sierra mine, near Downieville, J. W. Finney of Chicago has finished laying a 900-foot pipe line to furnish power to run a jet pump. It supplies the water under a pressure of 420 feet.

SISKIYOU COUNTY.

Yreka Journal: From the Dewey quartz mine, in Gazelle district, shipments of ore are being made. Four-horse teams haul from 12,000 to 14,000 pounds of ore to a load. Prospectors are opening up claims all over the dividing range of mountains on west side of Shasta valley, and on the opposite side of same range east of Scott valley.

The Chinese owners of the Last Chance, Montezuma and Fortune mining claims, at Callahan's, have sold their property to J. R. McFadden of Pittsburg, Pa., for $16,200. This ground is to be worked by the dredger process.

Mining has been suspended at many mining camps on account of a scarcity of water.

TRINITY COUNTY.

The Yellow Rose of Texas, owned by Carr and Miller, recently cleaned up twenty-seven ounces of gold in three days' run.

A 5-stamp mill has been put on the Lawrence mine, Coffee Creek.

The Nash deep gravel mine is putting in fluming. Where the company is drifting the pay dirt averages $80 between each set of timbers.

TUOLUMNE COUNTY.

The grade of the branch line of the Sierra railway is completed to Tuttletown, 5 miles north of Jamestown. From Tuttletown to the top of Carson hill, across the Stanislaus canyon, an elevated cableway 4 miles in length is projected, average height of 50 feet, the motive power to be supplied by an auxiliary cable attached to the cars and propelled by steam power at one end of the line.

At the Uncle Sam, near Carters, the crosscut from the 300 level toward the footwall vein 40 feet effects a contact with the quartz at 75 feet.

R. M. Ballard is succeeded as Supt. Dead Horse by E. T. Kane. The former takes a similar position at Auburn, Placer county.

Supt. Holmes has resumed work at the Mohican M. & M. Co.'s property. The Lillian tunnel, already in the vein 100 feet, will be driven 700 feet farther.

In a test run at the Laura mill, of rock from the Blue Star and White Star Consolidated, the ore from the main tunnel in on the vein 180 feet yielded $10.50 per ton; it carried 2% of sulphurets, worth $84 per ton. A small mill is to be placed on the property.

The Independent says the Rawhide and App mines are undergoing another examination by G. W. Hudleston of New York, who is said to represent an English company.

The Confidence mine ceased development work last week. Seventeen miners are retimbering the shaft. The ore on hand will be milled.

At Big Oak Flat the strike at the Four Oaks is attracting attention. Some of the rock is rich; the main ledge is rich in sulphurets.

The Little Wonder M. Co. has paid off its men and shut down its mine. They say that they will start up again.

At Groveland the Rhode Island shaft is over 200 feet deep and sinking continues.

The Kanaka Co. have put in a new air compressor and concentrator.

The Independent hears that the Little Wonder mine has been paid for by the Scottish California Mining Syndicate. The mine was bonded from F. Marconi one year ago.

The Slapjack Co. has let a contract to sink 150 feet and drift 400 feet.

Supt. McCallum of the Kanaka is credited with intention to put up a 10-stamp mill at the Duluke mine.

At Stent, on Sept. 3d, J. Opie, president Tuolumne union, states that there will be a double-handed contest, first money $125, $50 second; for single-handed drilling the prize money will be $40 and $15.

The Imogene mine at Stent has shut down. The property is owned by the Alder Creek M. Co.

At the Riverside cross-cutting on the vein in the face of the 1900-foot tunnel goes on.

The Little Giant is bonded to J. McCormick for one year, with option of purchase for $15,000.

On the Old Continental, Supt. Graham has men driving a 500-foot tunnel.

In the Bonanza mine a drift is being run to the east from the bottom of the incline for the vein.

At the Sonnet mine, owned by Davis & Lane, miners are cross-cutting for the Crab vein.

Sonora Democrat: At the Providence mine the shaft is down 900 feet. Ten stamps are at work.

VENTURA COUNTY.

The average yield of products from 100 barrels of Ventura county mixed crude oil of 24° B. is stated to be as follows:

	Bbls.
Gasoline, 70° B	3
Benzine, 63° B	4
Kerosene, 45° B	15
Heavy kerosene, 38° to 40° B	8
Gas distillate, 28° B	21
Light lubricating (spindle) oil, 26° B	10
Neutral oil, 23° B	12
Heavy neutral oil, 21° B	6
Reduced stock, lubricating oil, 14° B	5
Asphalt, crude	11
Loss	5

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—In driving a crosscut tunnel on the Cold Spring group, on Gold hill, the main vein was recently cut at a point 800 feet below the surface. The same vein at higher levels has been a rich producer. The ore is a sulphide, in the main, though carrying considerable free gold. It is stated $1000 per week is the net proceeds of operating this property at present.

Boulder, Aug. 5.

Eight miles from Boulder the Cold Spring tunnel, Gold Hill, is reported in fine streaks which averages $1 per pound.

At Eldora new strikes have been made and new machinery is being installed.

The Revenge at Eldora is shipping high grade ore and is producing at the rate of $5000 per month. W. B. Connell is the manager.

Near Eldora the Bird's Nest mine, on Spencer mountain, is reported sold to N. Macdonald of New York for $10,000. The Bird's Nest is cut by the Mogul tunnel at a depth of 650 feet, and shows ore.

The Bailey chlorination mill at Eldora has started up. The claims of the Andrews estate of New York have all been settled.

The American Star near Sunshine is nearly through with its legal troubles and is expected soon to resume.

The old Fourth of July mine at the foot of Arapahoe peak, idle since '75, has resumed.

CHAFFEE COUNTY.

The superintendent of the Clinton mine, Monarch district, says that a body of silver galena ore has been found in tunnel No. 2, on which two assays have been made showing $60. He also reports the opening up in a drift from the tunnel of a 12-inch vein of ore which assays one-half ounce in gold, 400 ounces silver and 20% lead.

CLEAR CREEK COUNTY.

(Special Correspondence). — The Gold Fissure G. M. Co., in sinking their shaft have encountered ore at 40 feet, which is undoubtedly the extension of the Tenth Legion lode, whose property end lines with the Gold Fissure. The shaft of the latter is being well timbered, and a plant of hoisting and air compressor machinery is being installed. The calculation is to sink to 800 feet depth. G. A. Bristol and C. B. Steele are managers.

Empire, Aug. 4.

F. R. Carpenter is engineering the establishment of a 240 heavy-weight stamp mill at the Alice mine in the Yankee hill belt of veins and plans to treat 1000 tons of ore daily. The 240 stamps will be of 1000-pound weight each and have a low drop. The ore averages about $5 per ton in gold, a portion of which can be saved by plate amalgamation. The tailings from the stamp batteries will make a desirable flux, which will be treated by pyritic smelter, the values being run into a matte.

Near Georgetown, work will soon begin on the Mendota shaft. The workings on the Mendota vein, which include the Mendota, East Mendota and Fulton, aggregate 3 miles, which, at an average cost of $10 a foot, represent an outlay of $158,400.

At the Sun and Moon, near Idaho Springs, Manager Sims has an ore body running $250 per ton. The Newhouse tunnel on Aug. 1st was about 400 feet away.

In the Stanley, Manager Bell is preparing plans for the new mill; concentrator capacity, 100 tons per day.

CUSTER COUNTY.

At Silver Cliff the Aburdix mine shaft is down 250 feet. Operations are going on at the 200-foot level and drifting is in progress. The Bassick will resume active operations; air drills are being put in. The Geyser at Silver Cliff, which closed down recently, is expected to reopen.

DOLORES COUNTY.

(Special Correspondence).—The three main groups of mines at Rico—the Enterprise, Rico-Aspen and Blackhawk—produce an excellent grade of ore, running 100 ounces silver, two and one-half to five ounces gold and 15% lead. It is most interesting to observe the increasing importance of the gold product of these time-honored silver mines. With the exception of the three groups named, nearly all the properties of Rico district are still in the hands of the original locators, who have hung tenaciously to their holdings through years of depression and discouragement. It is pleasant to observe a more hopeful condition here, which presages an opportunity for many of the old timers as well as for capital seeking to invest. Conditions at Rico are favorable. The mines are not over 10,000 feet altitude, the rock bearing the ore is soft and easily broken, making labor more effective than in many places.

W. J. Scoutt and associates have a lease and bond on considerable property here and have run a tunnel 2300 feet, a connection with which will be made with Jumbo No. 2. Then the ground traversed by the tunnel will be prospected by crosscuts. Electric drills are being put in here.

Rico, Aug. 4.

FREMONT COUNTY.

The Rocky Mountain Smelting Co. is erecting a new plant at Florence and has a lease and bond on property at Kokomo, controlled by the Uthoff tunnel, for sulphides and iron ore.

The Independent Oil Co. is drilling for oil in Newlin creek, 6 miles south of Florence. It has 3000 acres of oil land, and will drill a second well should it not be struck in the present bore. Drilling operations in the Florence oil fields are active; strikes have been numerous in the last sixty days.

GILPIN COUNTY.

(Special Correspondence).—A strike of rich ore was made last week at the 500 level on the Ridgewood, showing smelting ore which ran as high as $260 per ton, some of the richer specimens running $1000 per ton. The ore also contains considerable free gold. The Ridgewood is well equipped and belongs to a Boston company, whose interests are in the hands of M. P. Dalton and C. K. Colvin.

Blackhawk, Aug. 6.

Near Central City Manager F. Young is operating the Gunnell G. M. & M. Co., employing seventy-five men, and making daily shipments of milling ores to their mills on North Clear creek of fifty tons.

HINSDALE COUNTY.

(Special Correspondence).—The Tobasco mine, near the top of the divide, has been developed substantially the past few months and is now in position to ship ore. Manager Ray states that much of the ore averages $200 per ton.

Lake City, Aug. 6.

F. B. Hill has resigned the management of the Hinsdale M. & M. Co., to be succeeded by V. A. Robinson, who expects to soon have thirty men at work and be smelting ore September 1st.

Supt. Meek at the Bachelor has forty men at work.

HUERFANO COUNTY.

The Scantic mine has removed its machinery from Walsenburg and started the tunnel to be driven through Mount Blanca.

On the McMillan property Manager D. M. Murray will install additional machinery for increased production and work.

LAKE COUNTY.

(Special Correspondence).—The Leadville Gas & Electric Co. has been formed to consolidate the interests of the Boetcher electric light plant and the gas plant here to make extensive additions to both. Especially will the electrical facilities be enlarged with the view of supplying power, as well as light, to the mines throughout the district. The generators will be run by steam power, with a grade of coal which can be delivered at light cost. It is stated that many of the mine operators have given assurances of support, which will doubtless result in increased demands for electrical equipment in the district. The construction work at these plants and the operation thereof will be under the management of G. Wilkes & Co. of Denver.

Leadville, Aug. 1.

(Special Correspondence).—The Home M. Co. passed its July dividend, because of the expense which will be incurred in sinking the Penrose shaft to considerably greater depth to get under the present contact.

The New Monarch mine, on the north side of Breese hill, is shipping about forty tons of ore per day; it runs high in gold. A recent shipment was settled for on the basis of sixty ounces gold per ton. which is one of the many evidences of the importance of the gold product in Leadville's mosquito range mines.

Leadville, Aug. 7.

A contract has been let to Leadville men to drive the English tunnel 600 feet at the foot of Fletcher mountain, to cut the gold shoot on the Golden Chord property. M. Staine of Leadville is manager.

The Ballard mine of Leadville supplies bismuth. Johnson, Matthey & Co. of England and the Saxon government control the prices and allot the amount each country is to ship. The following prices are paid on delivery at works, deductions for treatment having been made: 10% ore, $150 per ton; 15%, $250; 20%, $350; 30%, $550; 40%, $750, 50%, $1000, on the basis of bismuth $1.25 a pound.

Eight thousand tons of zinc were shipped from Leadville to foreign ports during 1899. During the present year the production will be more than twice that, a large portion of which goes to the Vieille Montagn Works in Belgium.

At Twin Lakes is a large free milling gold region, a cluster of mining districts on the top slopes of the Saguache range where Lake, Chaffee, Pitkin and Gunnison counties corner, where granite peaks capped with trachyte rise to an altitude of 13,000 feet. The Little Joe is north of the Gordon on Mt. Elbert and under development by a Pennsylvania company. J. W. Dixon, president and manager, contemplates a 50-stamp mill. Its values are chiefly in gold; pockets occur of lead ores running 60% in lead.

Lorimer is a new camp established at the old site of Everett, at the junction of the north and south forks of Lake creek.

The Forest Queen has 1000 feet of development, including three tunnels on the vein, 200, 355 and 300 feet long. In the lower level is a spur vein with galena running 65% lead and sixty-two ounces silver. The main vein carries zinc blendes.

OURAY COUNTY.

In Denver it is said that the deal for the purchase of the Camp Bird mine near Ouray, from T. F. Walsh, its owner, by the Venture Co. of London, is closed and that the mine will be transferred to the English company this month. T. A. Rickard's report on the mine, after giving an account of the condition and extent of the property included in the transaction, is alleged to state that upwards of $4,500,000 in gold has already been taken from the veins, principally in development work. The development of the extensive property, the report says, the main vein having been traced for 1¾ miles on the surface, displays $17,500,000 worth of ore in sight, and it is further stated that only about 7% of the vast property has been thoroughly prospected, while only 5% of it has been developed. In view of the immense quantity of ore exposed, Mr. Rickard, in his report, regarded $15,000,000 as a low price for the property. The Venture Co., it is locally reported, will float the Camp Bird with a capitalization of $25,000,000, the company to be known as "The Walsh-Camp Bird M. Co., Limited," and Mr. Walsh to be given about 40% of the stock in that concern and $10,000,000 cash for the property, which will be sold on a basis of $15,000,000. Mr. Walsh will be the managing director. He was a poor man in Leadville in early days, now his income from mining investments is about $80,000 per month. At present he is in Paris.

PITKIN COUNTY.

Returns from a sixty-ton shipment of silver ore from the Argentum-Juanita mine at Aspen netted the company nearly $25,000; average value 690 ounces per ton. This ore came from the seventh level. The mine is being worked through the Mollie Gibson shaft. It is the intention of the company to cut stations until the thirteenth level of the Mollie Gibson has been reached, at which point levels will be run to cut the vein, thus opening a stoping area of 250 feet.

ROUTT COUNTY.

H. A. Lee, State Commissioner of Mines, and assistant, J. C. Langley, are at Steamboat Springs, investigating the mineral resources of the county, their findings to be incorporated in the next annual report of the mining bureau.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Alta, in Turkey Creek basin, belonging to A. J. Clark and associates, is shipping about twenty cars per month, being about ten cars each of crude ore and concentrate. The ores are sulphides, the principal values being silver and lead. In the course of the development carried on during the past two years ores of the value of $45,000 have been shipped, which has paid for all work and equipment. The mine is opened through four tunnels, one above another, about 200 feet apart, one tunnel being in 1600 feet, another 750 feet, another 500 feet. Most of this tunnel work is on the vein, which averages probably 2½ feet width of ore, which runs generally about $50 per ton. In a 220-foot upraise, connecting two of the tunnels, the same width of vein and values of ore are said to have been demonstrated.

Turkey Creek Basin, Aug. 3.

(Special Correspondence). — T. Walter Beam and A. J. Clark are extending the Mikado tunnel, in Savage basin, toward the Tom Boy vein. The tunnel has progressed 1750 feet, and may cut the Tom

Boy lode at a point 200 to 500 farther on and at about 1200 feet depth.

The Japan mine and mill are steadily operating with a force of sixty men, and is shipping out one car a day of concentrates, the result of reducing about five tons of ore to one ton of concentrate. The values run about one-half gold and the other half silver and lead. The mill is equipped with crushers, rolls, jigs, concentrating tables and canvas tables. The jig tailings are reground by a Huntington mill. The underground workings in the Japan are extensive, the great ore zone, which is claimed to be the same as that of the Virginius, is opened 2000 feet longitudinally and has about 5000 feet on the vein at various levels.

Both mills, the new and the old, of the Smuggler-Union Co. are operating and handling about 450 tons a day. Additional equipment will be put in to increase the combined capacity of the two mills to 550 or 600 tons per day. A wire rope tramway line, 3500 feet long, is being put up from the entrance to Pennsylvania tunnel to the old mill; this is supplementary to the main line, which runs from the main Smuggler tunnel to the new mill.

Telluride, Aug. 3.

The Palmyra mine, owned and operated by the Four Metals Co., is to commence shipping, having developed several hundred feet of stoping ground above the tunnel level.

At Telluride the Butterfly–Terrible people project new work, and are driving a new level, 150 feet above present workings. This will open a new era of fine ore. Twenty stamps of the milling plant are dropping; thirty men are employed.

The Silver Bell, an adjoining property, a silver-lead proposition, is to be acquired. The Silver Bell can be worked to advantage through Butterfly ground.

SUMMIT COUNTY.

Near Breckenridge, W. L. Wilson, Supt. Jessie property, expected to start the 40-stamp mill on the 10th.

The Golden Edge mill is running on ore from the Pony Express.

TELLER COUNTY.

(Special Correspondence). — A thirty-two-ton shipment from Letendre & Ritter's lease on Zenobia brought $150 per ton.

July shipments from the Lillie were 600 tons from the old workings. Development has been proceeding in new ground for several weeks.

The Vindicator management and its lessees shipped 3000 tons during July. The new plant of machinery will soon be ready for action.

Lessees on the Wacuweta, on Bull Cliff, are sinking in ore and expect to drift at the 300-foot level. The same shoot of ore has been opened on adjoining properties, shipments from which are said to run $40 per ton gold.

Work has been resumed on the Red Umbrella. The shaft is being sunk from 140 to 200 feet depth, with the idea of drifting at the latter level.

The Moose is more active than for two years prior to this date. A crosscut is being driven at 1000-foot station, with the calculation of reaching the ore shoot. This is a well equipped mine on Raven, which dropped out of the list of shippers two years ago.

The Detroit mill at Independence, Cripple Creek district, has been closed down. It is owned by Detroit parties. The process, for which the mine was equipped, is one of fine pulverization, leaching, amalgamation and concentration of tailings.

Victor, Aug. 6.

(Special Correspondence). — Olson & Johnson, lessees on the Ramona, on Bull hill, found a 2-foot vein at 85 feet depth as they were drifting on the second level. The ore is claimed to run seven to eight ounces gold to the ton. This property belongs to Reed & Hamlin and is situated 750 feet from the Wild Horse shaft.

The Creston Leasing Co. have obtained a twenty months' lease on a part of the Alamo grounds. A royalty of 20% is agreed on. New machinery is to be installed on the property.

The Wrockloff lease on the Burns mine, of the Acacia Co., shipped eighty tons of five-ounce ore, and the Brady lease, on the same group, shipped 100 tons which ran $45 per ton. Larger shipments are anticipated in the future.

Two cars of ore recently shipped from the Pointer are claimed to have run three ounces gold to the ton. The shipment came from the third level on the vein, which is 5 feet wide. The intention is to sink the shaft to 500 feet depth.

W. F. Goodling has taken an eighteen months' lease on the Nickel Plate claim on Copper mountain. He also has a bond with option to purchase at $50,000.

Geo. Schonhurst has leased the Kittie Hollis claim, with stipulations as to a certain amount of work to be done each month.

J. M. Abbott has taken a lease on the blocks 2 and 5 of the Eclipse, agreeing to work fifty shifts per month.

Ore running as high as fourteen ounces to the ton was found at 180 feet depth in new workings on the Kentucky Belle, just above Eclipse gulch, near the Moose. The newly found shoot is supposed to run into Moose grounds.

The Grafton Co. is operating the Hoosier on Tenderfoot hill. At the 300-foot level the rich ore shoot, from which shipments were formerly made, has been reopened. A carload shipment last week brought $260 per ton. The work is said to be in ore at the 300 and 400 levels.

After having been closed down several months as a result of disagreement among the stockholders, the Blue Bird, on Bull hill, has resumed work.

The July shipments from the Last Dollar amounted to 800 tons, most of which went to the smelters.

A new plant of machinery is to be put in at the El Paso Gold King in Poverty gulch. This property is under the same management as that of the Strong.

Milo Hoskins will superintend the work at the Anaconda, where a new hoist will be put in over the 220-foot winze from the main tunnel. A main shaft will be sunk from the surface. Much of the Anaconda grounds are under lease.

Work is soon to resume at the Whipp & Glenn shaft of the Pinnacle property.

A thirty-ton shipment of ore from the Nugget's Elizabeth Cooper shaft ran $70 per ton.

Three shafts are being sunk on the Santa Rita vein.

The Cripple Creek Sampling Co. is enlarging its operating facilities, making its capacity 450 tons greater per day.

The Jennie Semple, on Raven hill, is to be equipped with new steam power and air compressor plant.

The result of the consolidation compromise between the Independence Town & Mining Co. and the Wilson Creek Co. appears to be that a new company has been organized to take over the interests of both the contestants, the stock in the latter being divided between the shareholders of the two old companies. However, some discord appears to be growing out of the settlement, as some of the minority shareholders are dissatisfied and threaten to take the whole matter into the courts.

Cripple Creek, Aug. 7.

IDAHO.

BLAINE COUNTY.

Near Hailey, Scranton, Pa., men have bonded the Maryland Con. and have men excavating for a 10-stamp mill.

At Hailey the Gold Belt Power Co., W. T. Riley manager, proposes to put in a power plant on Deer creek.

BOISE COUNTY.

Near Idaho City the New England Co.'s new dredger above Warm Springs is reported working 2500 cubic yards per day. The ground is rich and good clean-ups are daily made.

The War Eagle Co. has bought the Buffalo mill, and will move it to their mines at Grimes Pass.

ELMORE COUNTY.

Miners near Atlanta are reported guarding mine Supt. Garrett and refuse to allow him to leave for his home in Spokane unless he pays them off.

At Atlanta the main Atlanta lode is from 40 to 60 feet in width.

At Rocky Bar the Sawtooth G. M. Co., E. C. Brockman, manager, intends to erect a new plant.

A Chicago company under the management of M. Wilbur is operating the Red Warrier group and employs twenty-five men.

L. Vinton has twenty-five men on his placer property 6 miles below Atlanta.

IDAHO COUNTY.

Warren reports a strike in the Little Giant mine, owned by the Idaho L. G. M. Co., along the adit level, east of the main working shaft—a 6-inch streak rich in free gold. General Manager Hill says it will be shipped crude to a smelter.

At Grangeville G. Mitchell declares: "I have located three claims in Robbins mining district. I recently received returns from samples sent to the Smithsonian Institute, Washington, D. C. The returns show 34½% nickel, 4½% copper and $4.15 in gold.

The Sampson group, 3½ miles from Pollock, is being prospected.

LEMHI COUNTY.

The Blackbird Copper-Gold Co., Salt Lake City, bought the Uncle Sam group in Blackbird mining district, 30 miles north of Salmon City. P. A. H. Franklin is president, M. G. Gilbert secretary and general manager.

SHOSHONE COUNTY.

At Wallace last week was taken the final step in the consolidation of the Frisco and Black Bear mines by the filing of a deed for the Black Bear from Larson & Greenough to the Frisco Con. M. Co., transferring the Black Bear mine, mill, water right, etc., for $600,000.

Near Wallace, the Headlight M. Co. will let a contract for running a 600-foot crosscut tunnel to tap its vein 400 feet below the surface.

The Hecla mine at Burke, Canyon creek, Cœur d'Alenes, is putting in a plant, including two 400 H. P. boilers, a compressor plant with a capacity of twenty drills and a hoist that can operate the mine to the 2500-foot level, to be in operation September 1. About 1000 tons of concentrates a month are being shipped.

Mining locations filed for record during July numbered 161—129 quartz, 7 placer, 23 water rights and 2 millsites—a total of 791 quartz locations for the seven months of 1900. The increase has been in the Cœur d'Alenes.

H. E. West, Gen. Mgr. P. N. M. Co. will recommend to the directors of the Snowshoe mine the development of the mine on a much larger scale than heretofore and the construction of a larger and more modern mill. The No. 1 tunnel is now in over 1800 feet, about 1200 feet of which is in ore. From this tunnel a winze has been sunk 220 feet. The 100-foot level from this winze is opened up about 800 feet and is in good ore. Mr. West's plan is to sink 500 feet and drift both ways.

WASHINGTON COUNTY.

(Special Correspondence).—The Pacific, Idaho & Northern railroad runs regular trains from Weiser to Cambridge, 40 miles distant. The latter town is near Salubria. From Cambridge to the copper mines of the Seven Devils is about 70 miles, which has to be traveled by stage or private conveyance. Development in the copper region has not been as rapid as was anticipated, though results of work done have been pretty satisfactory in most cases. A recent shipment from the Blue Jacket mine of ten carloads of ore ran 42% copper and brought $31,000. There has been a good deal of talk about establishing a copper smelter near Cuprum, but as yet no substantial move has been made to build one.

Cuprum, Aug. 4.

The Weiser Record says people are jubilant over the rekindling of the fires in the furnaces of the smelter at Mineral, 25 miles down the river—fires that have not burned for many years. Recent activity is occasioned by the buying of mines and smelters by wealthy operators and the employment of men to work in mines and reduction works.

MICHIGAN.

CHIPPEWA COUNTY.

The Calumet & Hecla M. Co. has bought a tract of timber land 225 miles east of the mine, for $650,000. The mines of Lake Superior use nearly 100,000,000 feet timber annually.

MONTANA.

DEER LODGE COUNTY.

In the Vipond mining district the Queen of the Hills group is under bond to W. A. Clark syndicate; the shaft is 100 feet deep. In the bottom is ore that assays $6 gold, ten ounces silver, 5% lead and $5 copper.

It is locally reported that the cost of the new smelter at Anaconda will be apportioned between the Anaconda, Parrot and Washoe companies and will be operated co-operatively. The daily capacity of the smelter will be 5000 tons.

C. E. Rueger has sold to Compagnie de Mines et Minerals Society Anoniyme, Bruxelles, Belgium, nine patented mining claims in the northern part of the district for $17,200.

The Montana & Idaho Copper Co., G. B. Conway, P. Mullins, B. E. Calkins, E. H. Renish and W. K. Foote, has incorporated; capital stock, $24,000.

FERGUS COUNTY.

E. W. King, Supt. Great Northern plant at Gilt Edge, has bought the Horse Shoe, Mule Shoe, Discovery and Pasaic for $75,000.

MADISON COUNTY.

At the Watseka mine, 10 miles east of Melrose, the high grade ore is shipped to Helena. The last consignment showed an average net profit of $56 per ton. The shipment consisted of nine carloads. A. W. McCune has determined to erect a new mill at the property.

At Red Bluff the Red Chief mine will put up a 30-ton concentrator. C. L. Sherman is manager.

MISSOULA COUNTY.

From Saltese the Monitor M. Co. has shipped a 25-ton car of ore—the first full carload of copper ore ever shipped from there.

SILVER BOW COUNTY.

At Butte, on the 8th, the entire surface plant of the Parrot M. Co. was destroyed by fire; loss, $100,000; insurance, $30,000; the 164 men employed in the mine all escaped safely through the workings of the several adjoining mines with which the Parrot is connected. The fire is supposed to have started in the carpenter shop from a spark from a passing engine. The six buildings comprising the plant were burned to the ground with their contents. The Parrot mine is one of the assets of the Amalgamated Copper Co. The fire was witnessed by John D. Rockefeller, H. H. Rogers and other Eastern capitalists interested in the company, who had arrived in the city the day before. General Manager Gallwey says the company will be hoisting ore again in five weeks.

At Butte the Amalgamated Co. closed down the Gagnon last Saturday, throwing out of employment nearly 300 men. The reason given is that the shaft needed retimbering. M. Hewitt, Supt. for a number of years, is superseded by W. Word of the Pennsylvania mine.

TETON COUNTY.

The Cracker group copper mines on the ceded strip of the Blackfeet reservation, at Altyn, is building a new concentrator. The town of Altyn is at the mouth of the canyon which leads up to the Cracker mines. Another canyon leads up to Bull's Head and Josephine group, which is being developed by the A. M. Esler Copper M. Co.

NEVADA.

ESMERALDA COUNTY.

(Special Correspondence).—B. E. Shear of Denver, Colo., and associates have taken an option on the Pontoon property, 20 miles east of Bodie, Cal., which they will develop to ascertain its value.

Belleville, Aug. 6.

EUREKA COUNTY.

Sentinel: This week what remained of the smelting plant of the Eureka Con. M. Co. has shared the fate of the Richmond, the old iron contained therein having been sold to the Joshua Hendy Machine Works of San Francisco, and by the use of giant powder it is being broken into fragments. It is estimated that there is about sixty tons of old metal remaining in and about the building; and when this is removed, all that will be left of that mammoth plant is the air compressor and two blowers on the lower floor and the light machinery recently used by the Eureka Sampling Works on the floor above. The buildings, Supt. McTerney says, will not be molested. At this time, when the last vestiges of the two big plants are being obliterated, some idea of the wealth which the mines of the two companies have produced here may be interesting. Of course the actual values of the ore taken out can not be even guessed at, but the following figures taken from the county assessor's books, and covering the period from April 1, 1873, to April 1, 1900, will give some idea of the enormous production of the two properties:

Eureka Consolidated.

Gross value of output	$17,480,923 63
Net value	5,296,277 35
Taxes paid	120,333 86

Richmond.

Gross value of output	$15,713,975 08
Net value	4,914,169 61
Taxes paid	119,044 27

Thus it will be seen that the gross output of these two mines alone has amounted to $33,194,898.71; net product, $10,210,446.96, according to the books of the county assessor, and during that period—from April 1, 1873, to April 1, 1900—they paid in taxes into the county treasury $239,378.13. The mines, of course, are still being operated, though the output has been greatly diminished.

LINCOLN COUNTY.

Supt. F. P. Swindler, at the De La Mar mine, will treat the 400,000 tons tailings, average value $2.40, by releaching.

The handling of tailings along with crude ores will begin when the automatic contrivance which is being devised by the Highland Boy, Utah, smelter is completed. With this the tailings will be delivered through a chute connected with the roof of the plant at an estimated cost of 15 cents per ton.

WHITE PINE COUNTY.

The Chainman mill is closed for repairs to the rolls. When operations are resumed it will probably be by the new company.

Work has begun on the Robust mill at Ely, to have a capacity of 100 tons daily.

NEW MEXICO.

The American Placer Co. is laying a pipe 5 miles long to work in Ancho gulch, Jicarilla mountains. S. L. Bean, Supt., J. T. Johnson, engineer.

J. P. McNulty, Supt. Tiffany turquoise mines, owned by the American Turquoise Co., 18 miles south of Santa Fe, is producing some fine gems. No gems have been taken from a depth greater than 120 feet. It is said that 140 feet is the limit for the production of real turquoise because the chemical composition necessary to produce it does not take place at a great depth there as in Persia, where turquoise in times past is reported found 800 feet below the surface. The Tiffany mines produce best at a depth of 40 to 60 feet. Regular shipments of gems go forward weekly to the New York office of the company. Before shipment the stones in the rough are composed and assorted into five classes, the rich blue gem being classed as No. 1 and the lighter stones grading down to the off-colored light green which together with its matrix of iron stained lime rock is usually cut in large size and worked up by jewelers into sleeve buttons and other ornaments.

BERNALILLO COUNTY.

The Bland mill is to resume operations under the management of V. V. Clark.

The Cochiti G. M. Co. is putting out about 5000 tons per month, yielding a gross output of about $33,000.

DONA ANA COUNTY.

Gen. Mgr. Geo. C. Hopkins of the New Mexico Lead Co. in the San Andreas mountains, 40 miles from Las Cruces, has a vein assaying 40% uncovered to the width of 16 feet. It is hauled in wagons 15 miles to the railway station on the White Oaks road, north of Tularosa: the freight charge for that distance is $10 a ton; on the railway, 90 miles to El Paso, the freight is $1.50 a ton. Two cars are shipped daily.

OREGON.

BAKER COUNTY.

At the Columbia M. Co.'s property Manager Baillie will have the new mill building completed next month and the ten new stamps in operation, increasing from a 10 to a 20 stamp mill.

Huntington reports $17,000 paid Vaughn Bros. by the Northwest Copper Co.—amount due on the Iron Dyke mine under the terms of the bond. There is but one more payment to be made before this property is transferred to the Nortnwest Copper Co.

GRANT COUNTY.

Failure to meet the $10,000 due August 1st under the terms of their bond and lease caused the parties holding an option on the Magnolia mine, Granite district, to permit the property to revert to the owners. Coyle, Conde & Jones will start the mill and work the mine themselves.

JOSEPHINE COUNTY.

The last of the season's clean-ups in the Sterling hydraulic mine of Ankeny & Cook gave $14,000 in gold bricks and $10,000 in coarse gold nuggets, some of the nuggets weighing nearly five ounces. The entire season's clean-up will amount to $100,000.

The Oak Flat placer mines, 700 acres of undeveloped placer ground, with a 5-mile ditch and water rights, are sold to Poole Bros. & Tomlinson of Denver, Colo., for $8000 and one-third of the capital stock of the company. The purchasers have organized the Oak Flat M. & M. Co., capitalized at $200,000, and will prepare for next season's run. The ground is on the Illinois river and Briggs creek, and consists of an old river channel having a deposit of gold-bearing gravel, which shows fine and coarse gold.

SOUTH DAKOTA.

CUSTER COUNTY.

Near Custer City, from the Tin Crown mine, several pieces of mica measured 12x22 inches. The Monarch Mica Co. of Chicago has undertaken large operations there. They claim to have a process by which small pieces of mica can be cemented together under high pressure and look as well as large ones, and the waste can be ground up for use in the electrical industries for insulators. The Standard Oil Co. also consumes a large quantity in making axle grease and other lubricators. The present supply of mica comes from North Carolina, Canada and India.

An Omaha company has a contract to ship 1000 tons of hematite iron ore from the Iron mountain, 8 miles north of Custer, to the smelters of Omaha, Denver and Kansas City. The ore in places runs 70% iron.

LAWRENCE COUNTY.

Manager Wales of the Detroit & Deadwood M. & M. Co. is about ready to start the new cyanide plant, 2 miles west of Portland.

At Lead the number of men employed by the mine, mills, railroad, water works, etc., is 2200. The payroll will average $200,000 a month. Much of the success of the Homestake mine is due to the management of T. J. Grier, an old telegraph operator, who worked for the Western Union Co. at Salt Lake and other Western points, and at Deadwood in 1878 as operator for the Homestake Co. The Homestake Co. is building an aqueduct 14 miles long from the headwaters of the Spearfish river to improve the water supply of Lead City and Deadwood. Six miles of the ditch will be 30-inch iron pipe. For the remainder of the distance the water will be carried through a wooden flume.

PENNINGTON COUNTY.

Spodumene mineral, which contains lithia, is found in considerable quantities near the Etta tin mine, at Hill City, and is shipped to Germany, where it is manufactured by the chemists. It comes in large white crystals like stalactite.

UTAH.

SALT LAKE COUNTY.

The Ben Butler at Bingham reports 3 feet of lead and silver ore in the east drift of the tunnel level.

Two more contracts for material to be used in the enlargement of the Highland Boy smelter were let last week—one for 350,000 pounds of iron and steel for the roaster building, the other for 300,000 pounds for the main building.

SUMMIT COUNTY.

Eastern men have bought the property of the Constellation M. Co. of Park City for $115,000, to be paid in two years.

The new Silver King aerial ropeway at Park City will be 7200 feet long; the cables will be supported by forty iron towers. Seventy-five buckets will be strung on the cables to have a guaranteed capacity of thirty tons an hour, delivering the ore in the ore bin at the rate of one bucket every fifty-seven seconds. The buckets will hold 6½ cubic feet—1200 pounds.

TOOELE COUNTY.

On the 1st the properties of the Con. Mercur Gold Mines Co., consisting of the Mercur and Golden Gate groups at Mercur, passed to the control of a single management. Shares in the consolidated company are issued in exchange for those of the old.

It is understood, says the Tribune, that the Mercur mill at Manning, from whose tanks the builders have derived over $3,000,000 in gold, will be made to handle the vast mass of tailings that have accumulated about it, while all crude ores will in a short time be put through the Golden Gate plant.

WASHINGTON.

FERRY COUNTY.

At Keller work has started on the Umatilla, bonded to a St. Louis firm for $75,000.

At Loomis, Mgr. Allcock of the Golden Zone is increasing the capacity of the mill to 100 tons daily.

SNOHOMISH COUNTY.

After a year's suspension, owing to a disagreement among the owners, the Sunset mine at Index has resumed operations.

WHITMAN COUNTY.

Near Palouse in the Blue Bird, Hoodoo district, M. W. Truax, manager of the mine, has begun development. It is a copper property.

FOREIGN.

BRITISH COLUMBIA.

The largest concentrator in British Columbia is probably the one at the St. Eugene Con., Moyie; capacity, 400 tons per day.

Victoria reports that the employes of the company operating at Blackland placers on Wreck bay, on the west coast of Vancouver island, say they have taken out $80 worth of gold in two hours' work.

Near Sandon in the Slocan, the Ivanhoe's new 150-ton mill will be ready for operation by September 15, is stated by J. Hickey, manager of the mine.

At Rossland, at the Le Roi, the compressor of 40-drill power is in operatien. The head works of the aerial tramway are in course of construction above the ore bunkers at the railroad on Black Bear flat. The combination shaft is timbered down to the 800-foot level, where sinking has been resumed. The mine is shipping 800 tons per day.

Of the present condition of the Miocene Gravel M. Co.'s property, Harper Camp, Cariboo, Manager R. H. Campbell says: "The total outlay to date has been $150,000. We expect to determine the value of the property within the next two or three months. Indications are all that we could wish; but the channel being so much larger and deeper than first anticipated, it has taken a great deal more time and money than we at first expected. However, we do not look upon this as a bad feature, and we expect to find the bottom pay stratum correspondingly larger. If the entire deposit could be worked by the hydraulic process, it would be the largest proposition of that kind in existence; but, unfortunately, one—and only one—of the principal requisites necessary for hydraulicking is absent, viz., the dump or outlet for the disposition of the washed material. The enormous deposit containing sufficient gold, its susceptibility for hydraulicking and the abundance of water at hand make the conditions extraordinarily favorable for hydraulicking if an outlet could be had. As it is, it must be a drift mine, if anything."

Ymir reports a fierce forest fire, which burned the Dundee concentrator. This concentrator was erected in August, 1898, at a cost of $16,000; it had a capacity of fifty tons per day and was connected with the mine by an aerial tramway 5000 feet long.

MEXICO.

Chihuahua Enterprise: After three years of seemingly fruitless effort, the sinking of a shaft 1300 feet and 1300 feet of drift work, which represents an expenditure of $100,000 silver, the Santa Eulalia M. Co. has at last struck it rich in its mine at Santa Eulalia. The first shipment of ore (100 tons) is made which will run 50 ounces of silver to the ton and 55% lead. Thirty tons of ore will be taken out daily, and the K. C. S. & R. Co. has contracted to take the entire product of the mine. The Hearst estate is the chief stockholder in the Santa Eulalia M. Co.

SOUTH AFRICA.

Cable advices from South Africa regarding the condition of the Johannesburg mines indicate a resumption of gold production before long; that the mines have suffered little apparent damage, especially those recently worked. Damages sustained by the other mines have been principally confined to the extraction of ore. Most of the properties will be ready for resumption when native laborers can be induced to return to Johannesburg. The mines are not flooded with water.

Managing a mine in the midst of war's alarms, with battles going on, is not an ideal form of mining life. How it affects one mine manager is illustrated by the following from Wm. Naas, manager of the Lancaster Gold, one of the Rand mines, who, under date of June 15, writes from the property: "The machinery is in good order, and also the buildings and cyanide works, where I had all leaching tanks refilled with water. In the case of the Botha's Reef mine, the hoisting of water was carried on during seventy eight-hour shifts. From May 1 to May 4 I had only one winding engine driver; from the 5th to the 21st I had two, and since the 22nd I had again only one man; 18,914 skips, equal to 6,619,800 gallons of water, were hoisted, and the water stood on May 31 at 5 feet below the third level. As regards the West Battery Reef mine, the Gould electric pump in the No. 1 shaft works now only ten hours per night. The water is kept at 3 feet below the fourth level station. The water in the company's dam stands at the 18 feet 9 inches mark, which is the same as last month. On May 28 I had thirty trucks of coal at the station which had arrived during the previous day and night, and only five hours were allowed me for off-loading. As a battle was raging to the south of us, in the direction of Doornkop, and heavy cannonading was going on from 9 A. M. to 12 M., my transport rider refused to work any longer as he had to bring his oxen in safety. On the 29th a tremendous cannonading commenced at 10:30 A. M. and lasted, without a minute's interruption, till 5:30 P. M., when the small-arms fire also ceased, and I could see from the headgear the Boer forces retreat and the British forces take up a position to the south, and about opposite the French Rand. Many of my boys got scared and ran away, but they came back during the next day or two. I could also engage other transport riders at a slightly increased price. I had all the coal brought from the station to the Botha's Nos. 1 and 2 shafts. On May 30, Boer scouts had a heliograph on the Lancaster West incline shaft headgear. During the day the British troops entered Roodepoort, and the railway stopped running in the direction of Johannesburg, but has continued to run up to this day (June 15) in the direction of Potchefstroom. Everything is very quiet here."

A. Brakhan, who remained in Johannesburg throughout the war, writes under date June 27 stating that in the Botha's mine there is now about 13,000,000 gallons of water, and that it will take about six weeks to unwater the mine, reckoned from the time when pumping work to the fullest extent can be started. He also reckons that the West Battery Reef mine can be unwatered under six weeks.

THE KLONDIKE.

The Tanana country is the scene of the latest stampede from Dawson.

G. E. Howard says the principal operations are confined to Homestake and Faith creeks, upon each of which he saw men shovel in from $60 to $100 per day. The diggings are located 60 miles above the confluence of the Tanana and McManus rivers. "There is little or no grub in the country, and it is difficult to get in during the summer season, and in consequence little work is possible at the present time. The mosquitoes are something frightful, and several instances are reported of men being driven insane as the result of attacks from the pests. On some of the claims work had to be abandoned on account of the mosquitoes."

He met a man who was entirely without grub, excepting an owl which he had killed, and with no clothing save a badly torn suit of underwear and a worn pair of gum boots. His face was literally eaten by mosquitoes and the man apparently was out of his mind, being unable to tell his name or from what part of the country he hailed. He was given some salt pork, which he devoured raw.

The Dawson News says: "While the output in the aggregate was larger than last year's by nearly 75%, the actual cost of production was so much greater that very few mine owners find a balance on the credit side of their ledgers, and a very large majority of laymen find themselves utterly ruined, with hundreds of workmen whose daily wages remain unpaid as the result of their winter's toil. The cause of it lies in the bad laws, excessive taxation and the defective lay system that has so long prevailed, affording protection to no one and permitting of the rankest kind of wildcat speculations with prospective mines at the expense largely of the poor working man. The remedy for the latter lies in a thorough protection to the working man, and this can only be given through a mechanics' alien law that will make not only the dumps, but the mine itself, responsible for the wages. The percentages on which laymen took claims all of last winter were entirely too small to warrant any possible profit except on claims that turned out exceptionally rich.

"Steam thawers have not proven the bonanza they were expected to be, and more men have been swamped by them this last winter by reason of the heavy cost of running them than can now be figured up.

"Existing conditions are such that in order to make mining profitable in this district a number of important changes will have to be made. First, the royalty must be abolished or materially reduced; titles to claims must be given; miners' licenses must be abolished or brought down to a nominal, indiscriminate head tax for every one entering the country—miner or no miner—and then the country will have to be thrown open to relocation before anything like a population can be expected."

Personal.

A. M. Wells, M. E., has returned to Denver from San Francisco.

F. N. Gibbs has gone to Rossland, B. C., to examine mining property.

L. D. Copeland has returned from the Mammoth mine to Phœnix, Ariz.

Wm. A. Farrish has returned to Denver, Colo., from Baker county, Or.

Milo Haskins has been reinstated as Supt. of the Anaconda, Colo., mine.

Marcus Daly is expected to return from Europe to Butte, Montana, on the 15th inst.

J. J. McDonald, representing the Gold & Silver Extraction Co. of America, is in San Francisco.

Lewis H. Eddy of the California State Mining Bureau is gathering information in Sierra county, Cal.

Alfred B. Sanford, assayer, has returned to Denver, Colo., from the Seven Devils copper region, Idaho.

W. L. Hallett, formerly of the Victor sampler, is now ore purchaser for the Eagle sampler, Battle Mountain, Colo.

J. Bawden has gone from Sutter Creek, Cal., to Victor, San Bernardino county, Cal., to take charge of the G. M. M. Co.'s quartz mill.

Duncan McVichie has gone from Salt Lake City to Bland, N. M., to supervise mining operations at the Cochiti and Navajo properties.

H. J. Allen manages the affairs of the United Verde Co., Jerome, Ariz., in the absence of Supt. J. L. Giroux, who is on a sixty-day vacation in the East.

H. Hirsching, recently engaged in extensive metallurgical operations at Goodspring, Nevada, proposes opening a chemical laboratory in San Francisco.

T. C. Archer, mining engineer, has returned from the Prince of Wales island, Alaska. He reports many good copper prospects, that require capital to develop.

R. A. F. Penrose of the Commonwealth mine, Pearce, Arizona, is in San Francisco. He expects to have the new 100-stamp mill in operation next January.

F. M. Johnson, Supt. Albemarle mill, Bland, N. M., is in San Francisco working on plans for the new 350-ton mill. He will return to Bland about Sept. 1st, and thence proceed to Boston to complete the plans and specifications, likely until the first of

November. Soon thereafter construction work on the new mill will begin.

WALDEMAR LINDGREN, of the U. S. Geological Survey, has returned to San Francisco from Molokai, Hawaii, and goes on a geological reconnoisance to eastern Oregon.

RICHARD U. GOODE of the U. S. Geological Survey is in Los Angeles, Cal., where he will make headquarters for work in southern California, beginning at Randsburg.

F. N. BRADLEY has returned from Alaska and gone to Idaho. In speaking of a successor to Supt. Robeson of the Alaska-Mexican mine, Mr. Bradley says that as yet no one has been chosen.

F. L. BROWN, till recently manager Pacific Coast branch of the American Steel & Wire Association, goes to Chicago to take charge of the business of the Shelby Steel Tubing Co., at an annual salary of $10,000.

J. V. CILLEY, general manager North Argentine railway of Buenos Ayres, S. A., is in Colorado investigating the operation of wire rope tramways. He is interested in a mine in the Andes mountains, on the western border of the Argentine Republic, about 14,000 feet above sea level, and purposes to connect the mine with the mill at the foot of the mountains, 21 miles away. This would be the longest tramway system in the world, and it is estimated that the cost of construction would be $300,000.

Obituary.

GEORGE W. PENNINGTON, senior member of the firm of George W. Pennington & Sons, steel manufacturers of San Francisco, died on the evening of the 8th inst. He was a native of Yorkshire, England, and in the 72nd year of his age. He came to the United States in 1863, locating in Pittsburg until 1883, when he came to San Francisco and established the firm of which he remained the head until 1895. He was well and widely known and highly esteemed by friends and business associates.

Commercial Paragraphs.

THE contract for material to be employed in the tramway for the Silver King, Park City, Utah, was awarded W. C. Bogue of Salt Lake City for $17,000.

THE Denver Engineering Works Co. are supplying a carload of electric motors to equip 15 and 20 H. P. electric hoists for the Colorado Electric Power Co. at Cripple Creek, Colo.

GILBERT WILKES & CO., electrical engineers of Denver, Colo., are supplying equipment for electric power plant for the San Juan G. M. Co. at Telluride, Colo., to be used in part for the operation of New Era electric drills.

THE battleship Wyoming will be launched at the Union Iron Works, San Francisco, on September 8. An invitation has been forwarded to Governor Richards of Wyoming requesting him to be present with four State officials.

THE Lunkenheimer Co., Cincinnati, Ohio, is building a large shop in Fairmount in that city for the manufacture of automobiles and iron valves. This is in addition to the present plant, which will be continued at the old location until the completion of the new works.

THE Risdon Iron Works, San Francisco, has an order for a 35,000-gallon steel tank to be used for the storage of fuel oil for railroads at Bakersfield, Cal. This tank will have a steel riveted roof. The Risdon Iron Works has the contract for repairs on the steamer Tellus, to cost $20,000.

Latest Market Reports.

SAN FRANCISCO, Aug. 9, 1900.

SILVER—Per oz., Troy: London, 28d (standard ounce, 925 fine); New York, bar silver, 60⅝c (1000 fine); San Francisco, 60⅝c; Mexican dollars, 49c.

COPPER.—New York: Lake, 1 to 3 casks, 16.50 cash; carload lots, 16.25; Electrolytic, 1 to 3 casks, 16.62½; carload lots, 16.25; Casting, 1 to 3 casks, 16.37½; carload lots, 16.25. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

Total foreign shipments of copper for the first six months of this year amounted to 199,366,720 pounds. Following is a table of export of copper from this country during the past twelve months compared with those of the previous twelve months:

	Tons.		Tons.
July, 1899....	7,160	July, 1898 ...	15,354
Aug., 1899 ...	10,920	Aug., 1898 ...	11,424
Sept., 1899...	7,553	Sept., 1898...	11,280
Oct., 1899....	11,360	Oct., 1898....	10,810
Nov., 1899 ...	10,800	Nov., 1898 ..	14,741
Dec., 1899 ...	15,550	Dec., 1898....	13,222
Jan., 1900....	14,035	Jan., 1899....	9,204
Feb., 1900....	12,749	Feb., 1899....	8,391
Mar., 1900 ..	20,149	Mar., 1899 ...	14,414
Apr., 1900....	12,762	Apr., 1899 ...	7,423
May, 1900....	13,997	May, 1899. ..	7,026
June, 1900 ...	15,312	June, 1899 ...	10,002
Total	152,346	Total	133,291

Estimating the value of these 241,255,040 pounds of copper exported during the past twelve months at an average of 17 cents, gives an aggregate valuation of $58,013,356.80.

LEAD.—New York, $4.25; Salt Lake City, $4.00; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £18 = 3.91c per ℔.

The new prices of the American Smelting & Refining Co., 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$4 20	$4 30
Chicago	4 20	4 30
Cincinnati	4 25	4 35
Pittsburg........	4 30	4 40
Philadelphia.....	4 30	4 40
New York........	4 25	4 35
Boston	4 32½	4 42½

On carload lots 5c. per 100 ℔s. higher.

During the first half of this year there were imported into the United States 98,726,096 pounds lead in ores and bullion, and 1,586,670 pounds metallic lead. During the same period there were exported 96,144,811 pounds foreign lead. Of the 100,312,766 pounds, there came from Mexico 85,867,420 pounds, from Canada 12,618,446.

SPELTER. — New York, $4.25; St. Louis, $4.15; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON. — Pittsburg, Bessemer pig, $16.50; gray forge, $14.50; San Francisco, bar, per lb., 2¾c. in small quantities.

Decreased consumption rather than overproduction is the source of the trouble.

STEEL.—Bessemer billets, Pittsburg, $18.00; bars, 1.10; tank plate, 1.15; San Francisco, bar, 7c to 12c per lb.

C. P. Huntington says: "I get English rails cheaper than $29. These English rails were designed for use in Mexico, and they passed through New Orleans in bond. They cost me $27.13 a ton."

QUICKSILVER. — New York, $51.00; large lots: London, £9 5s; San Francisco, local, $48.50@50.00 ℔ flask of 76½ ℔s.; Export, $47.

The Ætna's June output was 200 flasks. U. S. quicksilver exports for the first six months of 1900 were 510,472 pounds; for the corresponding period of 1899, 664,397.

MAGNESIUM.—New York, $3.00 ℔ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21½c; San Francisco, Plumbers', 100-℔. lots, 18¼c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $32.00; San Francisco, ton lots, 34c; 1000 ℔s., 34½c; 500 ℔s., 35c; less, 36c; bar tin, ℔ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℔ ℔.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ℔ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ℔ ℔.

TUNGSTEN.—New York, ℔ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ℔ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℔ ℔.; soda ash, $1.60 ℔ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℔ ℔.; blue vitriol, 5½@6c ℔ ℔.; borax, concentrated, 7@8c ℔ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ ℔.; caustic soda, in drums, 3@4c ℔ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 79c; cs., 84c; raw, bbl., 77c; cs., 82c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $2.95; single tape, $2.35; Hemp, $2.00; Cement No. 2, $2.95; Cement No. 1, $2.35, in lots of 3000 feet and up.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 45@50c ℔ ℔.

CANDLES.—Granite 6s, 16 oz., 40s., 12¼c ℔ set; 14 oz., 40s., 11¼c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: EDWARD N. BREITUNG,
MARQUETTE, MICH.

Quicksilver
——FOR SALE BY——
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET,
SAN FRANCISCO.

SAVE THE DROPS

WANT SIX MORE.

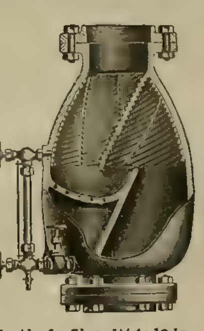
GENTLEMEN:—We have tested the Filter, running through some of the very rank oil that comes from our spindle borings, etc., and find it all right. Please forward six (6) more at once.
Very respectfully,
The Lodge & Shipley Machine Tool Co., Cincinnati, Ohio.

THE CROSS OIL FILTER

is in the largest power plants and shops in the World because it stands just such tests as the above. Experiment at our expense. Your Supply Man will send you one on approval. If not satisfactory, we pay the freight. Catalogue.

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.

Quicksilver
For Sale in Lots to Suit.
REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.



Separators for
Every Service.

Our new catalogue shows a very complete line of separators designed to cover special requirements for large steam storage, extreme high pressure, extra water capacity, etc.

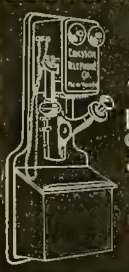
Austin Separators

are guaranteed, and are without a rival for eliminating condensation from Live Steam and removing oil, grease and other impurities from exhaust.

We ship them on 30 days' trial to responsible parties and pay freight both ways if not satisfactory.

Vertical. Sizes 1½ to 12 in.

AUSTIN SEPARATOR CO.,
27 W. Woodbridge St.,
Detroit, Mich., U. S. A.



ERICSSON SWEDISH TELEPHONES

Seem to possess almost human intelligence. They respond to every requirement in a smooth, positive fashion that shows what a perfect telephone can do. Besides this they have unequalled strength and durability. Their reputation as "STANDARD OF THE WORLD" is built on merit. Is the best too good for you?

ERICSSON TELEPHONE CO. 296 BROADWAY NEW YORK.

SITUATIONS WANTED.

BY A BLACKSMITH. Thoroughly understands and has had many years' experience in all branches of mining work. Also is a good machinist and has had several years' experience in handling steam. Address J. C. Blacksmith, care this office.

CHEMIST.—TECHNICAL GRADUATE IN CHEMistry with some experience in commercial work, and especially assaying. Have good grounding in surveying and draughting. Box A. this office.

WANTED.—A SITUATION BY A COMPETENT Assayer, Surveyor, Draughtsman and Bookkeeper, with good references. Address L. R., this office.

WANTED.—POSITION AS ASSAYER OR millman in cyanide plant. Several years' experience, and understands the handling of machinery. Can also serve as bookkeeper. Best of references. Address M. S. A., care of this office.

Experienced Accountant and Assayer, with knowledge of cyaniding and complete assay outfit, wishes employment with mining company, or would like to hear of favorable field for custom assay office. Highest references. Address L. S. U., this office.

WANTED—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

CYANIDING.

Have had charge of five mills and worked in every part of process from shoveling to laboratory work. Test ores and outline process for treating them. For three years treated SLIMES successfully. Wish a position after July 10. Have studied to excel. References as to character and ability.

Address I. B., care Mining and Scientific Press.

WANTED.

WANTED.—A THOROUGHLY DEVELOPED, siliceous gold property with a possible output of fifty tons per day. In close proximity to railway. Values must not go below $5 per ton in gold. Address X.Y.Z., Mining and Scientific Press.

WANTED.—A CHEMIST AND ASSAYER FULLY conversant with the latest and most economical methods of cyaniding; also an Assistant Assayer and Chemist. State salary expected and forward testimonials. Address "Extraction," care of Mining and Scientific Press.

WANTED.

An Ore Tramway—Bucket or Jig Back—Cable and Terminals.

Must be in perfect order for use in central Arizona. Length 1700 feet. Grade 24%. Daily capacity 80 to 100 tons. Address "TRAMWAY," 406 Rookery Building, Chicago.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,
ASSAYERS AND WASTE PRODUCT SMELTERS,
1661 Larimer St., Denver, Colo.
Write for Donaldson's Assayers' Slag Hammer.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.
Office—214 Pine street, San Francisco, California.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

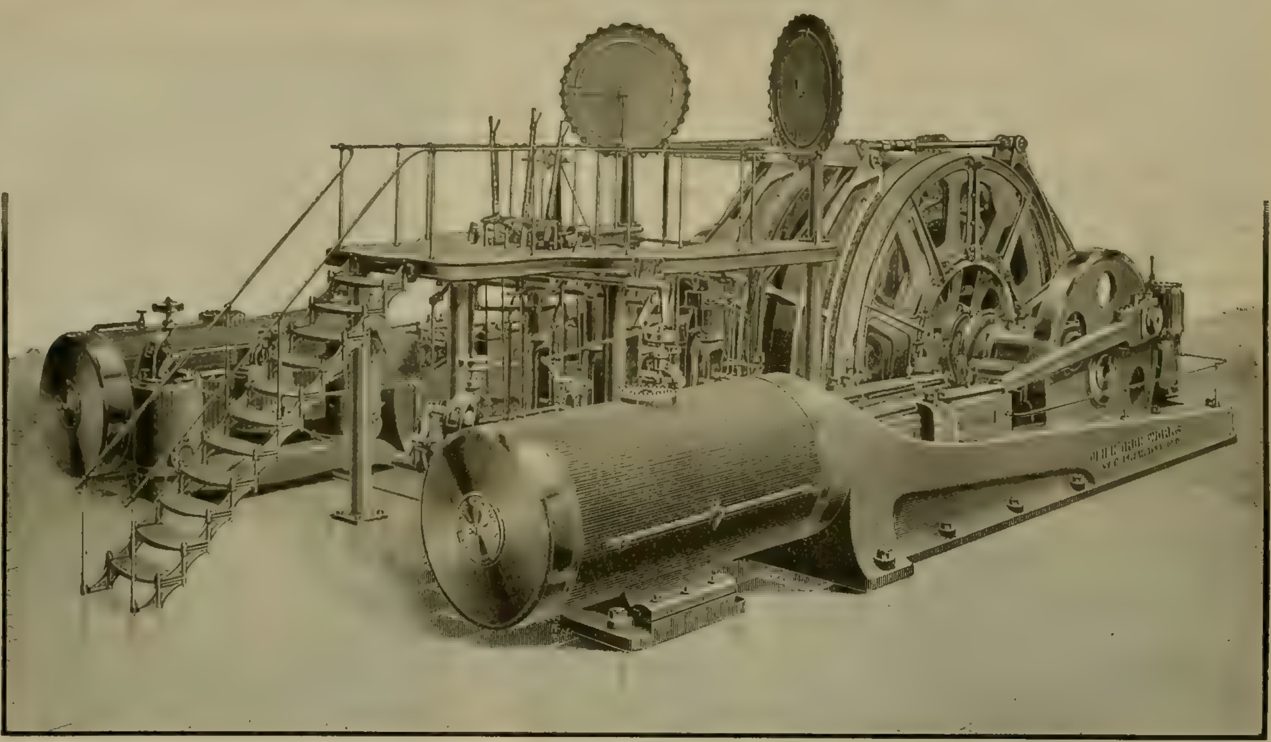
Direct Acting
Hoisting
Engine

BUILT FOR THE
Anaconda
Copper Mining
Company
OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS
16 TONS EACH,
or total freight carrying capacity
of train 50 tons.

CAPACITY
OF
ENGINE,
50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO.,

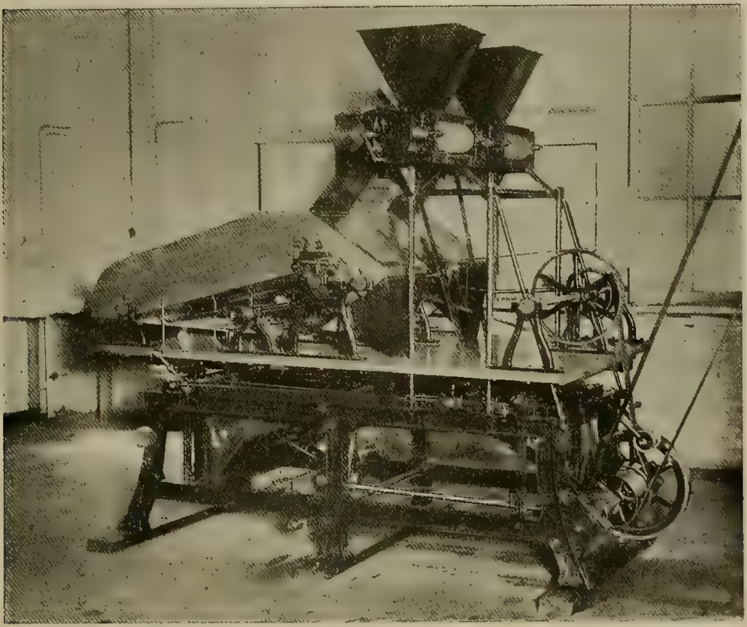
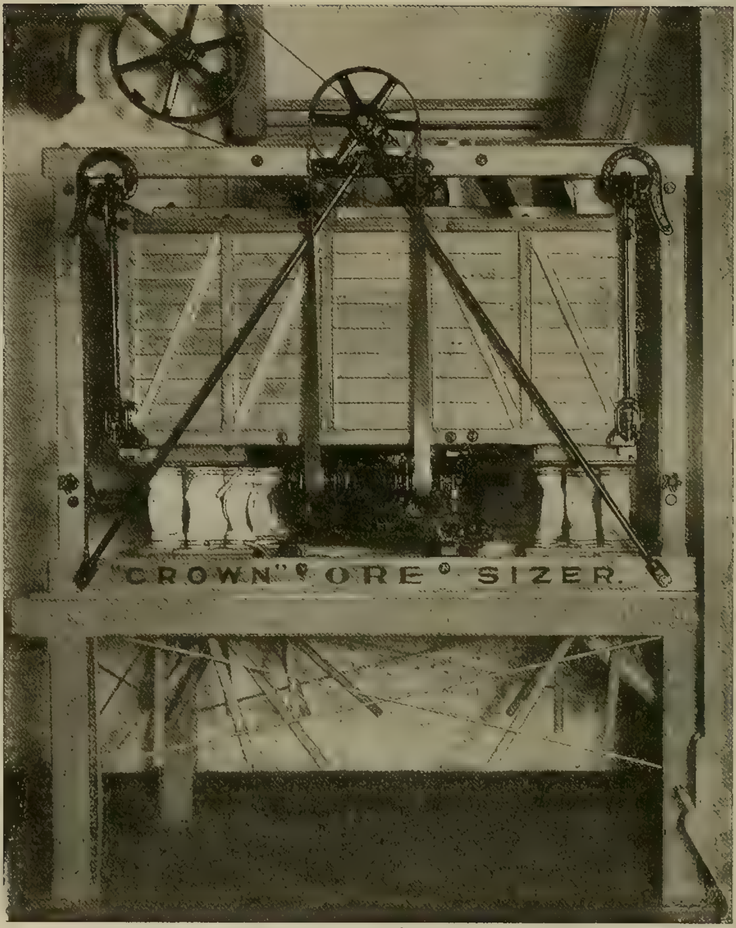
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.





Works, 23 Stevenson St. Office, 230 Post St. SAN FRANCISCO, CAL.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SMOOTH-ON CASTINGS.

TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

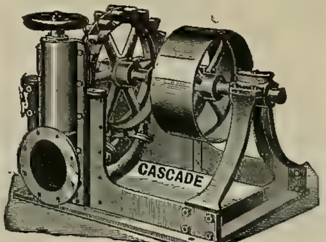
Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,
121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL

Adapted to all Heads from

3 Feet to 2000 Feet.



Our experience of 38 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

THE COLORADO IRON WORKS CO.

ESTABLISHED
1860.

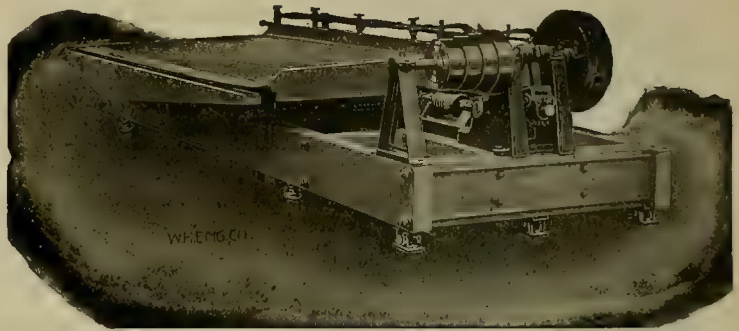
DENVER, COLO., U. S. A.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From The Denver Evening Post, July 15th, 1900.

* * * "Now about concentrating tables. Here's a fellow who says there's nothing equal to the Wilfley, and I am trying to convince him that old man Woodbury over in California makes the finest table in the world." "No, sir," said his comrade, "you're way off. I've tried the CAMMETT too thoroughly to believe there's anything made to equal it."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

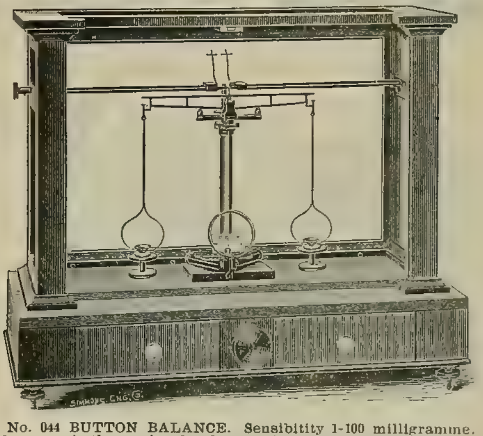
Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.

If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.

If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can dlace any other instrument. Send for descriptive catalogue B to



No. 044 BUTTON BALANCE. Sensibility 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

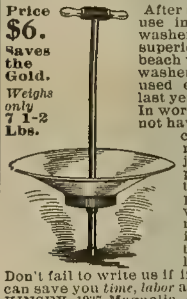
THE LITTLE ALASKA GOLD WASHER.



Price $6.
Saves the Gold.
Weighs only 7 1-2 Lbs.

After several years practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

IMPROVED PORTABLE HOISTING ENGINES

Sole Manufacturers of
Kendall's Patent Quartz Mills.

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at **Greatly Reduced Prices.** Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

THE IMPROVED BARTLETT CONCENTRATING TABLE.

The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

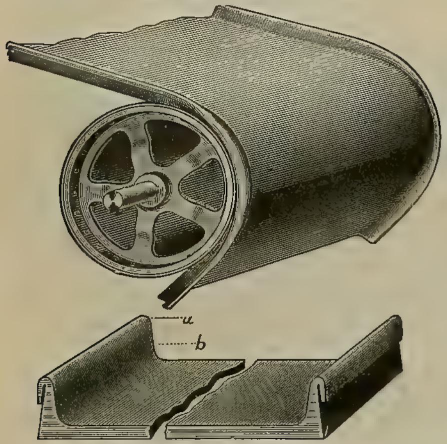
Send for printed list and specify your requirements. I can save you money. WILLIS SHAW, 627 New York Life Building, CHICAGO.



THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

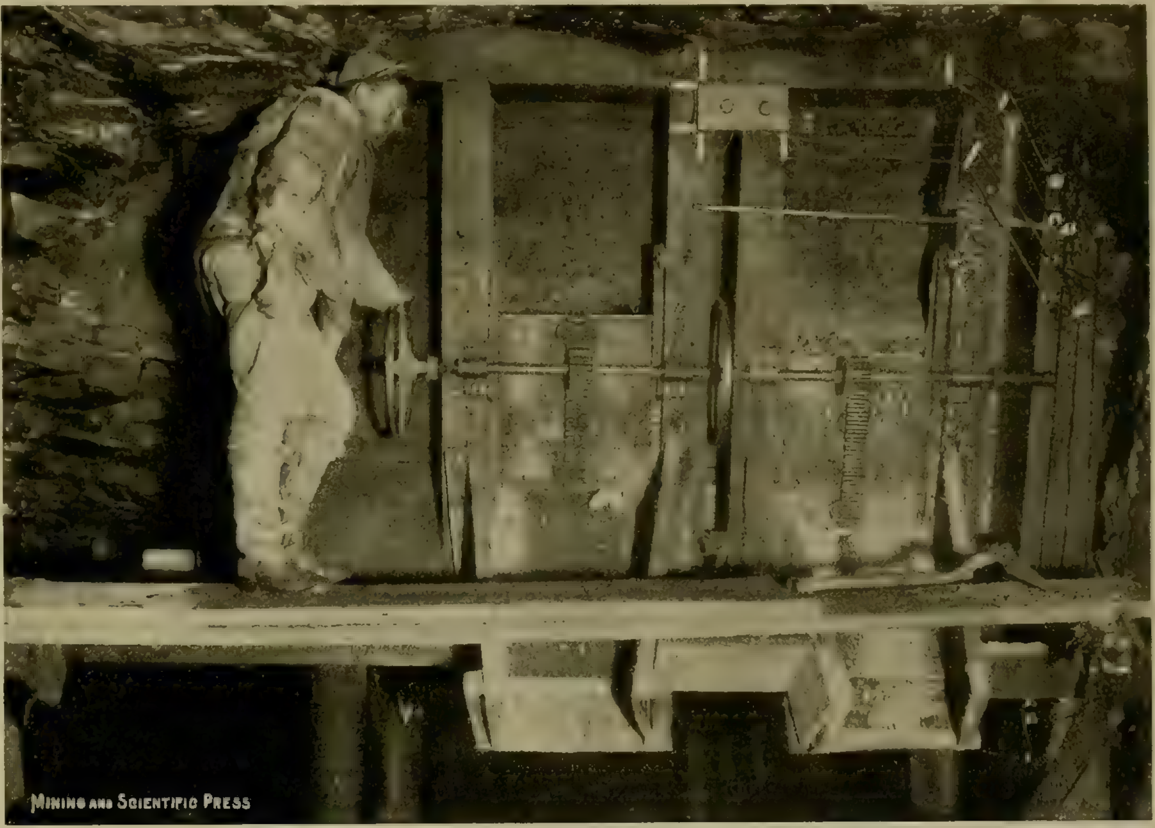
Lead Ore Imports.

In an extended editorial discussion of "Lead Tariff, Prices and Supply" in the issue of July 21st, regarding the importation of Mexican lead ores, the statement was made that, "the chairman of the Bureau of Statistics for the U. S. Treasury Department in 1898 made official report that 21,000,000 pounds of lead had been entered that could not be accounted for."

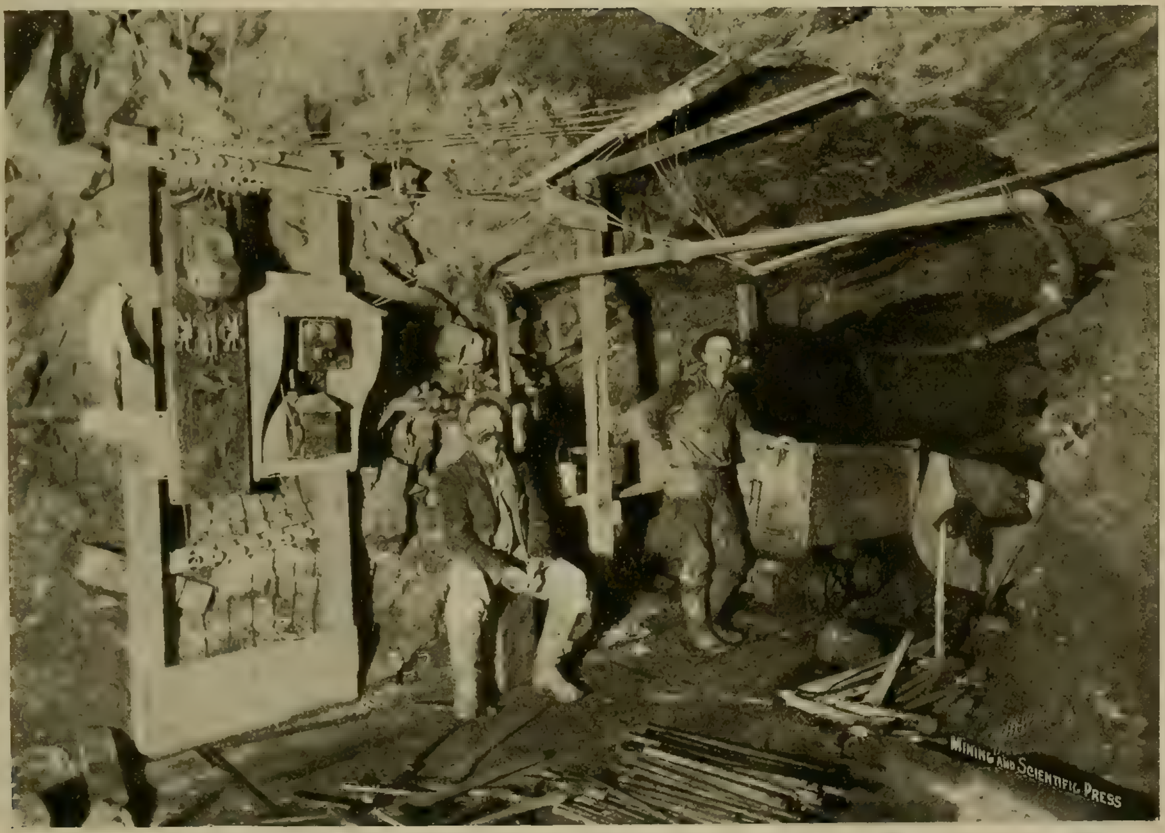
The accuracy of this statement has been questioned, and the fact has been denied. The chief of the Bureau of Statistics in Washington furnishes the following statement:

	Pounds.
Lead in warehouses beginning of fiscal year 1896	21,000,000
Imported in bond	187,522,267
Total	208,522,267
Retained for home consumption	109,000,000
Exported	64,888,000
In warehouse at end of 1896	13,634,267
Total	187,522,267
Short	21,000,000

This establishes the truth of the statement in the issue of July 21st. Each statement made in that article is susceptible of similar substantiation.



Ore Bins in Shaft, Empire Mine, Grass Valley, Nevada Co., Cal. (See page 184.)



The 2100-Foot Station, Empire Mine, Grass Valley, Nevada Co., Cal. (See page 184.)

Official U. S. Treasury statistics show that in the year 1896 were imported from Mexico 231,747,741 pounds silver-lead ore, of the value of $6,153,894; this contained 29,207 tons of lead. During the same year British Columbia shipped into the United States 63,785,106 pounds lead ore. It is true that less than 183,000,000 pounds lead ore were imported in 1890, but lead in ores was duty free prior to Oct. 5th of that year. Following is further official U. S. Treasury report of the quantity of ore imported in each of the three succeeding years and the lead contained therein:

	Pounds of Ore.	Lead Contained.	Per Cent Lead.
1891	239,086,809	40,289,808	16.85
1892	317,599,298	50,382,297	15.86
1893	406,209,367	59,426,588	14.63

These figures show that Mexican silver-lead ores do not contain more than enough lead to smelt themselves successfully, and that the present duty on lead in ore is not prohibitory.

◆

ELECTRIC RAILWAYS in most large cities develop newer and suburban sections at the expense of older settled districts; more especially is this the case in that part of a city which is too near the business center to be valuable for residence purposes, and, at the same time, too remote from the business centers to be of value for business purposes. Such property is the worst kind to own as an investment proposition, and the most dangerous upon which to loan money, as there is no guide in establishing its market value.

"NEXT WINTER will be the wettest of any for twenty years in California," is the prophecy of California coasting captains, which will not be objected to by California miners.

AND now it is seriously proposed by well meaning but mistaken Canadian legislators to reopen the whole vexed question of mining law in that province. Like all other sections, all that the miners of British Columbia need or ask is just to be let alone. It would seem from past experience that Canadian legislators should know this. Their action in 1899 created turmoil and entailed loss. The only result of the proposed Canadian legislation would be to again check the progress of the mining industry throughout that whole area.

IT used to be said that "trade follows the flag," and that belief still exists, but statistics do not substantiate it. There is no sentiment about trade, its function being to supply human wants that it sometimes helps to create. What a great many consume constantly they will buy where they can get it the cheapest, asking and caring little where the supply originated. Patriotism is not dominant in buying and selling. Taste and fashion are more potent. Geographical situation, the cost of the product laid down, are prime factors also. Trade will, however, "follow the flag" that shelters it. If the flag secures peace and rightful law to the trader, and if its folds carry assurance of protection, trade will follow wherever it flies.

LOFTY disregard of petty detail is not characteristic of the successful man. It is not he who makes the general suggestion or to whom occurs the abstract idea that has contributed most to mining or scientific progress, but the man who patiently wrought out the idea into practical shape. Like other crude material, it is the workmanship, the detail, put upon an idea that makes it of value. Probably to many had occurred the idea that some kind of vegetable fiber would well serve in the incandescent electric light, but it was the patient, steady experiments of Edison and his expenditure of thousands of dollars that produced the practical result. To many minds had doubtless occurred the idea of some swift process of effectually converting iron into steel by blowers, but Bessemer and his years of research and expensive experiment constituted the necessary detail that made it commercially profitable.

Permanence in Depth.

In the last paragraph of the third and concluding part of Manager Starr's excellent paper on the Empire mine, Grass Valley, Cal., on page 185, occurs a suggestion deserving of editorial endorsement and observance by many. Speaking of the mine as a permanent, profitable proposition, in the last sentence in his article, he refers to the desirability that the "shareholders will be willing to receive a reasonable interest return on their capital and will endeavor persistently to open up reserves in excess of extraction."

The non-observance of such suggestion, the clamor for constant dividends, and the hesitancy marked by their being passed, have ofttimes proved fatal to successful continuance of work that would have made a good, permanent mine out of a promising property—this without any individual reference, but as a general observation. It is to be noted that in most ore shoots there are frequent local irregularities, as occurred in the Ophir vein, in the mine of which Mr. Starr so instructively writes; and such local irregularities make it difficult to judge without extensive exploration whether the end of any certain ore body has been reached.

Where there exists among stockholders a constant demand for dividends, an insufficient understanding of the true economy of mining; where thereby has resulted the habit of immediate distribution of all of the mine's profits as dividends; where reserve funds for necessary development or exploratory work are thus unavailable, splitting or pinching or local impoverishment in any level at any depth has too often been the occasion of closing down a good mine. Lack of nerve, a discounting of the future, and limited understanding of the requirements of the situation on the part of those who hold the purse strings, are among the causes of idle and deserted mining camps in many a section where, under better understanding, should be constant and profitable extraction of ore.

The truth of this is manifest by simply referring to the best gold quartz producers in California to-day; and this applies to other States as well. A score of mines whose names will occur to California miners attest the fact that a pay shoot continues far below the depth at which at one time many of such mines had been developed.

In this regard it is to be noted that while many smaller veins carry only one ore shoot, in larger fissures there are generally several of them, and there is a constant probability that in such veins thorough exploration laterally or in depth will develop new bodies of ore, if the one on which exploitation has been carried on is found to pinch out. Of course, the first question naturally arising is as to whether with increased depth and cost of mining it would be good business or of likely profit to carry on necessary dead work. That such necessary dead work has been resultant in the making of many a great mine should go far toward taking the question out of the domain of theory and placing it among established fact. In each individual case this question of such interest to mine owners must naturally be decided by the record of the mine and the character of the fissure.

In an extended discussion of this subject of permanence in depth in California gold mines, W. Lindgren in a monograph on the quartz veins of Nevada Co., Cal., published by the U. S. Geological Survey, discussing this matter, says:

> It is generally conceded now that fissures are, comparatively speaking, surface phenomena, and that below a certain depth, where plasticity and flow of rocks under pressure come into play, open spaces can not exist. This limit Prof. Heim, for instance, places at 16,000 feet, while Prof. Van Hise, basing his consideration on the strength of rocks, arrives at 33,000 feet as the maximum limit for hard rocks in which fissures can exist. Even the lowest of these estimates far exceeds the depth of practicable mining. But it is not likely that all fissures continue until that limit. On a small scale the discontinuance of fissures may be observed in extensive sheeted outcrops. It is also an incontestible fact that many small veins close up in depth, while others continue unchanged. In considering the probable permanency of a given vein, its general character must be taken into consideration. Continuous well-defined outcrops and large bodies of quartz are in general good indications of the maintenance in depth, as is also any evidence of strong faulting and movement. Some quite extensive veins, though, have relatively short outcrops. Thus, the Eureka-Idaho practically shows croppings only for a distance of 2000 feet, but within that distance they are very prominent. Those of the North Star are less than 2000 feet long. From the developments to the east along the Omaha system it is pretty certain that the vein does not continue far across in that direction. A fissure which can be definitely proved to extend only a short distance will in all probability be found to be correspondingly limited in depth. In regard to probable permanency of the vein in depth, the Ural and Merrifield, along which extensive faulting has taken place, stand first in the districts.
>
> In scrutinizing the scant statistics of the production, in tons and value, of the Grass Valley district, it can not be denied that they show on the whole a distinct increase. There is also a distinct decrease in the average value of the ore. It is not safe, however, to draw too far-reaching conclusions from these data, because there are many factors involved: The cost of treatment and mining has decreased greatly by reason of the modern methods introduced, and more low-grade ores are now milled than formerly; nor are there any rich surface ores left to swell the grade.
>
> Leaving the difficult question of deep mining out of consideration, there are, however, in both districts a large number of veins which have been only slightly developed, but which with improved methods may be converted into paying mines. The development of these will probably maintain the production of the district for many years in the future, even if no new ore bodies are discovered in the old mines.
>
> It can be confidently stated that there is no gradual diminution of the tenor of the ore in the pay shoots below the zone of surface decomposition. Within the same shoot there may be many and great variations of the tenor, but there is certainly no gradual decrease of it from the surface down. This important fact has been previously stated by those conversant with the veins. The statements to the contrary are due to imperfect acquaintance with the facts and generalization from insufficient premises.

Mining Combinations.

The tendency to "trusts," combinations and combines, so manifest in all departments of the industrials, is daily more apparent in the mining world. From Michigan, Colorado, Utah, California, Nevada and Washington come reports of combinations of adjoining mining properties in the interest of economy, it being usually figured that it is cheaper for two or more contiguous mine properties to consolidate interests and dispense with a double set of managers and office force, besides doing away with the ever present possibility of mine litigation. Of course, it is manifest that in the very nature of things the ordinarily accepted elements of "trust" methods do not nor need not enter into any combination of gold mining properties, as that form of industry is exempt from any need of manipulation of price or supply, the product being of fixed value and universal and unlimited demand.

The latest report of metal mine combination is from California, where quicksilver producing properties in Colusa and Lake counties are reported to be consolidated into one organization, formed under the laws of New Jersey.

California has a practical monopoly of quicksilver production on this continent, and the conditions would seem more suggestive of all the possibilities of a "trust" than ordinarily obtains.

In this regard is to be observed the current conflicting conditions of the quicksilver industry. Boston, where several of California's quicksilver mines are owned and managed, wires this week:

> Some fear is felt in the trade that the world's production of quicksilver is likely to prove unequal to the growing demand. The total supply in 1899 was about 95,000 flasks from Spain, Italy, Austria and California. This was less than for quite a number of years, with an exception of two. The production of the cinnabar mines of California, the only large producers upon the American continent, has declined from 79,000 flasks in 1888 to only 28,100 in 1899. The principal mines of Spain and Austria, which have been producing for nearly 2000 years, are the only other producers of importance, except Russia, producing 8700 flasks last year, none of which came out of that country. Spain produced 39,340 flasks in 1899 and Austria only 15,000.

Such statements in the form of an Associated Press report usually precede a rise in the price of the article so discussed. But in this case there is a depreciation in current quotations, which this week, locally, are $48@48.50 per flask, domestic, and "about $45" for export. London advices also report a decline in price there.

Concentrates.

THE amount of tin in commercial tinplate varies from 3% to 9%.

FRANCE imposes a duty on lead ore and lead in pigs, bars and sheets of 30 cents per 100 pounds.

SILVER PLATING amalgam plates for gold mills was thoroughly discussed and illustrated in the issue of Feb. 17, 1900.

THE Carborundum Co, Niagara Falls, N. Y., can correctly answer the Colorado, Utah and Arizona questions concerning abrasives.

THERE are several dry concentrators in New Mexico, Arizona and southern California, and, in a limited way, are said to do good work.

THE attitude of the industrial world to mining development is one of constant and confident expectation and of commercial interest in further possibility of profit.

TO FIGURE the size of a steam pipe, an engine builder says the diameter of the steam pipe in inches equals the square root of one-sixth of the horse power of the engine.

OBTAINABLE DATA would indicate that three and one-half tons of rock per pound of explosive used is the average displacement in cases where there have been large blasts.

COMPOUND ENGINES are now made and in successful use in which the cylinder ratio is 1:7, and are sold under a guarantee to use a maximum of 12½ pounds dry steam per I H. P.

A SUBSTITUTE for German silver can be made by the use of manganese, the different metals and their proportions being as follows: Copper 65.25%, manganese 18.50%, zinc 13%, aluminum 1.25%.

THE Supreme Court of the State of California, in the case of Kern County vs. Lee (July 30, 1900), has decided that the California Mining Act of 1897 was effectually repealed by the act of March 20, 1899.

A "BLEEDER" on a steam boiler is the pipe and valve used to convey live steam from a boiler to make up a deficiency of exhaust steam. It is called a "bleeder" because of the rapidity with which it takes heat from the boiler.

IF it cost 50% of the gross value of the ore to produce, treat and defray all expenes of operation, then it would be necessary for a mine capitalized at $1,000,000 to have $2,000,000 worth of ore in sight to give the stock its full intrinsic par value.

BY actual count 247 notices of this paper were observed in different publications in the period from June 15 to Aug. 15, 1900, that is, during the last sixty days. And of these every one was complimentary. This is believed to be worthy of notice.

VERDIGRIS can be removed from copper plates by thoroughly scrubbing them with very fine sand and water, using a gunny sack or scrubbing brush. After the sand is washed off, scrub with a solution of one part oil of vitriol and four parts water.

IRON can be distinguished from steel by the use of a drop of either dilute nitric or sulphuric acid. If the surface remain unaltered, or nearly so, when so touched, the metal is iron; in the case of steel a black mark will be left, showing the liberation of carbon.

THE grain side of a leather belt should be run next to the pulley. Belt makers say that 25% more power can be transmitted with the grain side than with the flesh side next the pulley. A piece of beeswax occasionally rubbed on the belt and pulley ought to stop the belt from slipping.

THE Supreme Court of California has recently ruled that a technical objection to the manner of fixing monuments to mining claims is not sufficient to depose the original locators, if they have otherwise acted in good faith. This decision was made in a case from San Bernardino county.

FOR spelter—metallic zinc—ores carrying 60% at least are requisite for profitable result, and the less iron or lead the ore carries the better. The ore is not susceptible to smelting, but requires careful roasting. Hence the cost of extraction limits its commercial possibilities in Colorado and elsewhere.

LEAD miners are in no way liable to lead poisoning. The danger only occurs when the ores are smelted. It then results entirely from the formation of lead dust and of volatile lead fumes. In order to obviate the danger it is necessary to prevent lead fumes from being formed, or to conduct them away as rapidly as possible.

ILLUMINATING gas burning 5 feet per hour in an open burner has about 18 candle power. In San Francisco such gas costs about $1.50 per M cubic feet. On that basis electric lighting current would cost about 11¼ cents per kilowatt hour. California electric companies uniformly charge flat rates, others selling by meter measurement.

NOT all the "fakes" are found in the lying prospectuses of Copper Gongs and Golden Crowns. Of equally spurious character is the "capitalist" in alleged search of "a good going mine," or "a thoroughly developed property," who expects the owner of the property to prove its worth at his (the owner's) expense, and then let the "capitalist" have it at the price of an undeveloped prospect. And, sometimes, when one of those "capitalists" and the author of a meretricious mine prospectus get together, each trying to cheat the other, there is considerable undisguised hilarity on the back seats.

"THIS makes six subscribers I have induced to take your paper this year," writes a British Columbia subscriber, enclosing $3 and a new name, "for I feel that I am doing the mining industry a service in extending the circulation of so excellent a paper." This illustrates one of the ways in which the circulation of this paper is extended by its manifest worth.

THEORETICALLY a pipe 10,000 feet long, 12 inches diameter, will discharge 4.25 cubic feet per second under a head of 100 feet. In practice the figure would require modification. Under the conditions stated the mean velocity would be 5.41 feet per second. The area in a square foot of pipe is the same as the contents of 1 foot in length of the pipe in cubic feet.

SAN FRANCISCO'S normal annual rainfall is 23.4 inches. Fluctuations have occurred between a rainfall of 7.4 inches in 1850-51 and 49.2 inches in 1861-62. The variations in the winter rainfall are due to the changes in the positions of the lines upon and along which the areas of low pressure originate and move in their course from the North Pacific ocean into the interior of the continent.

THERE is no limit to the distance compressed air can be carried. The question is one of power, economy and local conditions, and cannot be specifically answered unless all the factors in the problem are supplied. In general working results can be secured with a distance of 4 miles between compressor and drills. By keeping out inch-pipe and elbows the efficiency of a pipe line may be increased.

THE use of even a weak solution of cyanide in cleaning amalgam plates is not favored by many millmen, who use dilute nitric acid, salt and water or scalding hot water, though the last sweating process is not considered good except at long intervals, or in shutting down the mill indefinitely. A page article in the issue of July 1, 1899, gives some practical points on this subject of cleaning plates.

TWO PER CENT would represent, approximately, the average content of silicon in the pig iron produced in American furnaces. Under certain conditions, the effect of manganese added to molten metal is to cause nearly 40% of the combined carbon in pig iron low in silicon to revert to the graphitic form. The strength of test bars so treated is increased 30%, the depth of chill decreased 20% and the shrinkage decreased about as much.

A LOCATOR of a mining claim can let it alone, do no work on it for five or six years, and if every one else lets the claim alone, he can get a patent by doing work or improvements to the amount of $500. But he takes chances right along during the period he fails to comply with legal requirement. His title is good as long as no one thinks the claim worth jumping. The $100 annual work is not "to keep the title alive," but to prevent it from lapsing.

ABOUT as large a storage battery as any in the country is that of the Chicago Edison Co., 139 Adams street. It consists of 166 cells—60 end cells—83 on each side of a three-wire system. Each cell contains 87 plates 15½x32 inches. The tanks are of 2-inch ash, lined with 5-pound sheet lead; each tank is 21½ inches wide, 79¾ inches long, and 43¾ inches high, and weighs 6200 pounds. The entire battery, exclusive of conductors, weighs 1,029,200 pounds. It has a capacity of 22,400 ampere hours at an eight-hour rate.

WATER can absorb about one-twentieth of its volume of air, and all water which has not been boiled contains almost as much air as it can absorb. One pound of water at about 70° F. occupies a volume of 0.016 cubic feet, or 2.3 cubic inches, and one-twentieth of this is 0.115 cubic inch. That is, one pound of water at ordinary temperature contains about 0.115 cubic inch of air. When water is converted into steam the air which it contained passes off with the steam, and occupies a volume which depends upon the pressure and the temperature.

THE Homestake and Highland mines, Lawrence Co., S. D., are owned by Mrs. Phœbe A. Hearst of Washington, Lloyd Tevis and J. B. Haggin of San Francisco, the Portland by Clinton, Iowa, people, the Horseshoe by a Canadian syndicate, the Grand Junction by Spencer & Crary, Custer City, the Holy Terror by J. S. George and the estate of J. J. Frayel of Milwaukee. The Golden Reward belongs to a company of which E. H. Harriman, Stuyvesant Fish, August Belmont, the Robert Goelet estate of New York, Samuel W. Allerton of Chicago and Harris Franklin of Deadwood are the principal stockholders.

SUCH words as "about" and "more or less" are often inserted in a contract of sale in order to relieve the seller from liability in cases where he has used his best efforts to deliver the amount called for. In any case in which the seller, under such a contract, has tried, to make delivery as stipulated, the courts will allow him a fair margin to cover unavoidable mistakes, and as much as 10% has in some special cases been held to be such fair margin. But the seller is never allowed to take advantage of this clause for the purpose of deliberately compelling the buyers to accept more or less than he has contracted for. The Supreme Court of the United States, for example, has held that the words "about," "more or less," and the like, used in such cases, are effective "only for the purpose of providing against accidental variations arising from slight and unimportant excesses or deficiencies in number, measure or weight." (6 Otto, 168.) In every case it is the seller's duty to weigh or measure out, and deliver, as nearly as possible, the exact amount called for by his contract. In doing so he is protected by the terms of his contract against any liability arising from the fact that it is impossible to deliver precisely the amount for which the agreement calls. But a seller cannot claim protection from the saving clause of the contract until he has tried in good faith to fulfill its main stipulation.

ALL substances are either attracted or repelled in some degree when in the field of a strong electro-magnet. If attracted, they are said to be paramagnetic; if repelled, they are diamagnetic. If a rod of any substance is suspended by a fiber so as to swing freely horizontally between the vertical poles of an electro-magnet magnetic induction takes place, and as the lines of force between the poles are essentially horizontal the effect of the pull or thrust upon rotation is greatest for the particles farthest from the axis of rotation. If paramagnetic, therefore, the effect is to pull the rod into a longitudinal or axial position, with its ends as near the poles of the magnet as possible; and if diamagnetic, the rod is pushed into a transverse or equatorial position, with its ends as far from the magnetic poles as possible.

FOR the fiscal year ending June 30, 1900, the exports of copper were 333,340,725 pounds, or 148,813 tons, valued at $55,772,166, as compared with 254,987,164 pounds in 1899, or 113,833 tons, valued at $34,476,343. The manufactures of copper exported in 1900 were valued at $2,079,541, as compared with $1,507,186 in 1899. The exports of sulphate of copper for the fiscal year ending June 30, 1900, were 47,790,765 pounds, valued at $2,120,745, as compared with 27,474,801 pounds, valued at $1,173,186 in 1899. The export trade in sulphate of copper was not separately reported until 1898, in which year was exported 14,736,373 pounds, valued at $475,707. The total value of exports of copper, not including ore, and manufactures thereof, including sulphate of copper, in the fiscal year 1900, was $59,972,452; that of $37,156,715 in 1899 was the next largest.

TO HOLD the possessory title to a mining location not less than $100 worth of labor must be performed or improvements made thereon annually until entry shall have been made. The first annual expenditure becomes due and must be performed during the calendar year succeeding that in which the location was made. Expenditure made or labor performed prior to the first day of January succeeding the date of location will not be considered a part of or applied upon the first annual expenditure required by law. Failure to make the expenditure or perform the labor required upon a location will subject a claim to relocation, unless the original locator, his heirs, assigns or legal representatives have resumed work after such failure and before relocation. Annual expenditure is not required subject to entry, the date of issuing the patent certificate being the date contemplated by statute.

IN last week's issue in response to a question as to how to best get the gold or amalgam off old copper plates, a leading assayer furnished "Concentrates" with suitable answer. Upon its appearance, another experienced authority says that a good way to free copper plates from gold is to put them over a charcoal fire and slowly evaporate the quicksilver. The plates should be cooled gradually, then rubbed with muriatic acid, put in a damp place over night, then rubbed with a solution of sal ammoniac and saltpeter, and slowly heated over a thin red fire, but not allowed to get redhot. When the gold scale blisters the plates should be taken from the fire and the gold scraped off. Where the gold has not blistered it should be treated with the solution and again fired. Collect the gold scales in an earthen dish, cover with nitric acid till the copper is dissolved, when the gold can be smelted; after melting, corrosive sublimate should be used in the crucible till a blue flame ceases to burn.

THE Quintera lode, Sonora, Mexico, is a silver ore containing galena, 11% to 16% zinc, 8% to 11% copper, and arsenical and antimonial sulphides. The yield in silver is 100 ounces per ton; the gangue is quartz. The stamped ore is roasted in reverberatory furnaces with four-graded hearths at a low temperature. Ores containing blende require three hours, other ores, two hours, at each hearth. The addition of 4% to 8% of salt is made at the last hearth two hours before discharge. The chloridized ore is discharged on a cooling floor in heaps, and is then charged into vats with sand filters of a foot in thickness. The lixiviation with water lasts fifteen to twenty-four hours, the chlorides and sulphates of copper, zinc and iron being dissolved. Lixiviation with double hyposulphite of calcium and sodium follows, the best strength of solution being found to be 0.55% to 0.66%. The silver is precipitated by a calcium polysulphite solution. The sulphides are collected twice a week, dried, roasted at low temperatures in a reverberatory furnace and incorporated in the cupellation with litharge. For cementation of the copper in the leaching waters, copper mattes from lead smelting have been used with success. Very poor silver ores are concentrated, agglomerated with clay and 10% of charcoal, and smelted with ores of a superior grade in a water-jacket furnace, the chief difficulty being caused by the high percentage of zinc, arsenic and antimony. The copper matte is concentrated to 40% by resmelting. The slags carry 1.3 ounce of silver per ton. The cost of 1 ounce fine silver at last accounts was stated to be divided as follows: Mining 36.0%, milling 26.4%, administration 6.9%, profit 30.7%.

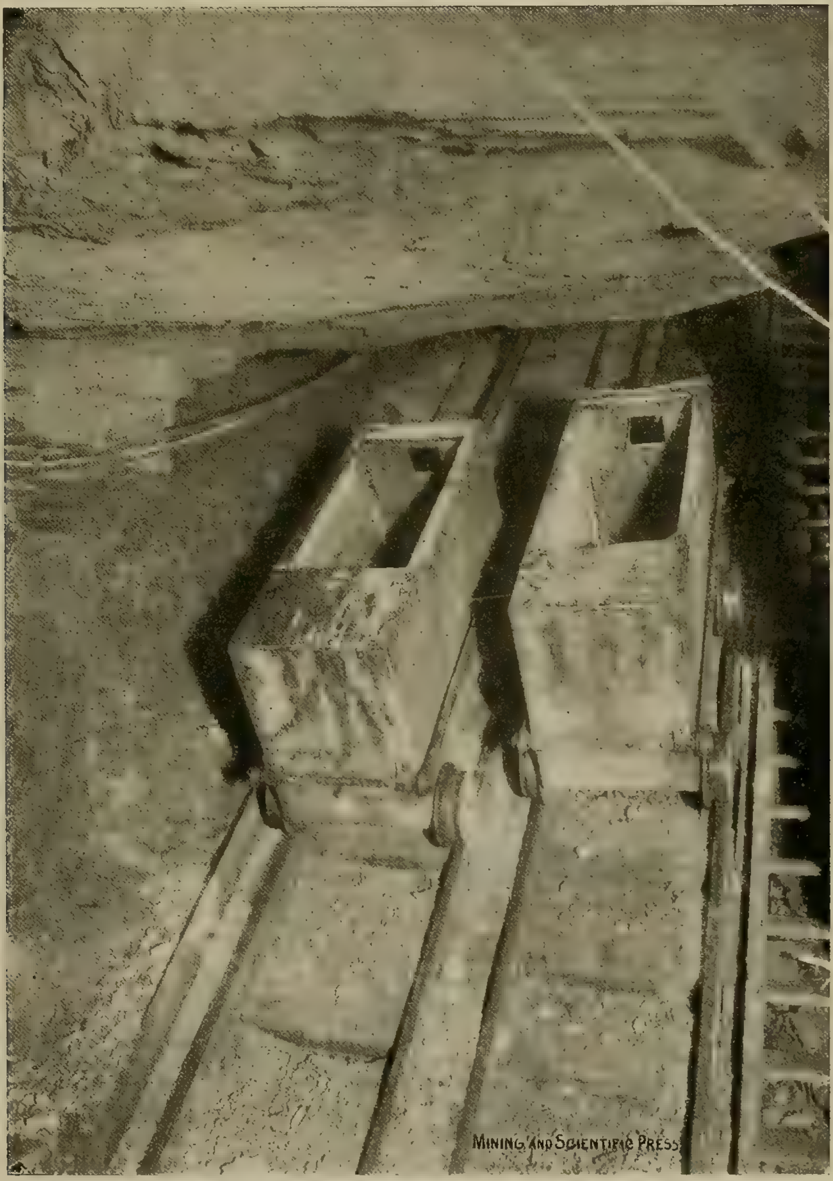
The Empire Mines, Past and Present.

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by
GEORGE W. STARR, Resident Manager.

The main working shaft is sunk on the Ophir or Empire ledge, with miles of drives extending along the vein at different levels. The Rich Hill and other veins, lying in the hanging, will be worked by crosscuts run from the 800, 1400 level, etc.; thus many drives on the Ophir vein may have a series of parallel drives on different veins.

Underground development work is carried on with 3½-inch air drills, Rand and Ingersoll-Sargent. The air is supplied (pressure at drill 80 pounds) by a duplex compressor, cylinders 16x24 inches stroke, designed and built by the Risdon Iron & Locomotive Works; two inch Baby drills are used for raises and some stoping. The average cost per foot for 5x7 foot drives being: Materials, $1.16; miners, $2.87; power, maintenance, hoisting, etc., $1.73; total per foot, $5.76. From 1892 to 1898 shaft was sunk 110 feet. In 1899 shaft was sunk 205 feet. This year it is expected we will sink 400 feet, making a total depth on the incline of 3080 feet, All costs of shaft sinking in 1899 amounted to $16.87 per foot; the ground, however, was very favorable.



Skips in Shaft, Empire Mine, Crass Valley, Nevada County, Cal.

Levels were formerly run giving about 100 feet of backs, but owing to their extent (the 2100 level is now 3900 feet long, extending 2500 feet north and 1400 feet south of the shaft), the levels will be kept far enough apart to give 250 feet or more of backs. The veins have general northerly and southerly direction, with an average dip of 30° to the west; they continue without disturbance from the surface rock formation down into the deepest and last intrusive rock formation of the Grass Valley district and can be relied upon to extend to great depth. They vary in width from a mere seam to 1, 2 or 3 feet, and have many branches that, when found, must be drifted upon before it can be determined which one constitutes the main vein. All quartz in the vein is not pay ore, some of it not being worth even a dollar per ton. The bonanza value occurs in shoots or bunches, which in my opinion form laterally (in zones) along the course of the vein, with other shoots horizontally therefrom and parallel thereto on different veins, but without any regular trend or, if any, opposite to the trend of the nearest crossing. The values in the quartz consist of free gold, which is easily amalgamated, and from 2½% to 3½% of sulphurets that run from $60 to $200 per ton. The quartz at times carries so much free gold as to be "specimen rock," and probably a percentage of this rock is lost by theft.

Notwithstanding great care in surface draining and a very complete system of drain tunnels, the mine makes considerable water. In winter 450 gallons per minute are pumped from the 1100 station to drain tunnel and 250 gallons per minute from the 2200 station to 1100. The Cornish pumping system is used and will this year be supplemented with an hydraulic pump at the 1100 station, capable of lifting 600 gallons per minute to the drain tunnel. This pump will be operated with water under a head of 820 feet. In a recent test it was found that our Cornish pump system gave a realized efficiency of 52% of the original power (water) applied to Pelton wheels under a head of 420 feet.

After being mined the ore runs or is shoveled or trammed through intermediate drives into large bins provided with gates. From these bins it runs into the ore train. This train consists of six cars, each holding 1200 pounds, drawn by a mule, the grade of the drives being ½ of 1% in favor of the load. The cars used underground are the Rand "U" type, side tipping, made entirely of iron. The ore is thus hauled and dumped into bins at the shaft, from which the skips, each holding 3500 pounds, are loaded. The shaft is 16x7 feet, divided into three compartments consisting of two haulways, ladderway and pumpway; gauge of track, 30 inches, laid with thirty-pound steel rails. The shaft is lighted with incandescent electric lights placed 50 feet apart. Each hauling compartment is provided with electric return signal bells and a telephone system communicates to the principal stations from the hoist and machine shop. All wires are in conduit.

At a speed of 1000 feet per minute the skips are hoisted and automatically dumped on grizzlies at the top of the headgear, the finer particles falling direct into the lower ore bins, the coarse falling into a separate bin holding 150 tons. In front and just below this bin is a No. 5 Gates crusher, which, when running, is fed with a continuous stream of quartz by opening the gates leading from the bin. The waste rock is loaded into the skips from a compartment of the shaft bins, hoisted and automatically dumped into a bin holding 150 tons, situated below the upper ore bin, from which it is trammed, in side-discharge cars, to the circular waste dump.

The hoisting works consist of a headgear 94 feet high, supporting ore and waste bins (lined with 30-pound "T" rails), crusher, etc. Foundations are six cement piers, 11 feet deep, 4½-foot base and 2½ feet on top, on which rest main sills, 18x24 inches Oregon pine, main framework 18x20, Oregon pine. The hoist was designed by Connors & Grant, built by the Union Iron Works, and consists of two 6-foot reels, with 8-foot friction bands driven by paper frictions 24 inches diameter, 13-inch face, operated by two 10-foot Pelton wheels, each with three nozzles controlled by hydraulic gates. Capacity of hoist at present depth is 750 tons in twenty-four hours, it being designed for future requirements and capable of hoisting from a depth of 5000 feet at a speed of 1000 feet per minute. Water under a pressure of 420 feet is used for hoisting, pumping and for compressor, with steam and necessary engines in reserve in case of failure of supply.

The pump, compressor and boiler house is situated back of the collar of the shaft and extends under the incline of the headgear. Thirty feet in front of the collar of the shaft is a building 30 feet by 120 feet, in which are blacksmith, machine and carpenter shops, with all necessary lathes, planers, drills, presses, etc. Over the shops are two changing rooms for underground men, one for each shift, bosses' room, supply and timekeepers' room. The changing rooms are heated with hot water passing through pipes, on which clothes are dried.

From the crusher the ore passes into the lower ore bins, which hold 150 tons, provided with bottom discharge doors, from which it is trammed in side-discharge cars, each holding one ton, to the ore bins in the mill. These bins hold 600 tons. Here it passes through the 40-stamp mill (run by electric power, with water power in reserve), over vanners and finally into a Gates slime plant. Satisfactory assays of the ore before it enters the mortars are not as yet obtainable. The pulp is assayed when it leaves the plates, when it enters the slime plant, and when it finally passes through the tailings automatic sampler, after leaving the slime plant.

The percentage of recovery is as follows:

By battery amalgamation	.518
Outside plates	.231
Vanners	.147
Settling tanks for overflow, cleanup escapes, float, sulphurets, etc	.012
Slime plant	.038
Total extraction	.946

The above is the average for eighteen months. The following percentage averages are for three years: Per cent of amalgam to 1 ounce of quicksilver fed in mortar, 2.98 ounces; per cent of gold to 1 ounce of quicksilver fed in mortar, 1.41 ounces; milling costs per ton ore crushed, $0.4924.

The mill is of the usual type, Homestake pattern mortars, stamps 850 pounds, 7-inch drop, speed 100, order of drop 1-5-2-4-3. The character of the ore requires fine crushing; 40-mesh screens are used. Run of plates 4x17 feet, 1½ inches to the foot grade. The cleanup pan consists of a large cast iron bowl, revolving twenty times per minute, set on an angle of 45°.

Cannon balls are placed in the bowl and revolve in an opposite direction to the pan, grinding and cleaning thoroughly all amalgam, headings, magnet iron or anything from the mill requiring grinding. A continuous overflow of water washes out all waste material, leaving a product which is easily cleaned up.

From December 31, 1878, to January 1, 1899, ore mined and milled 218,241 tons, at a total expense of $11.15 per ton.

From December 31, 1898, to January 1, 1900, the following results were obtained: Ore mined, 24,682 tons; ore milled, 24,707 tons; development work, 5665 feet; total expense per ton, $7.09. For six months of 1900: Ore mined, 14,784 tons; ore milled, 14,280 tons; development work, 4310 feet; total expense per ton, $5.97.

With improvements now under way at the mill 2700 to 3000 tons of ore will be milled monthly, and development work increased at least 800 feet per month.

The average width of the ledge in the numerous stopes is at present less than 2 feet. By stoping in an average width of 2 feet, increasing tonnage milled and a hoped for reduction in the cost of power, I expect to bring all costs under $5 per ton, including 800 feet of development work per month.

The appearance of the surface of this property has been the subject of much comment. The collar of the shaft is arched with granite. All buildings of the plant are enclosed with No. 26 galvanized iron and built on rock foundation, no timber rests within 4 feet of the ground. The floors of the mill are asphalt, laid on a concrete foundation.

The office is built of stone and contains, besides the usual general and private offices, map, drafting, assay, retort and melting rooms. A portion of the basement is used for a store room, from which supplies are issued.

Adjoining the plant is a natural park, beautiful with lawns, shrubbery and an artificial lake. Cottages have been built for the officials of the company that are suggestive of Burlingame or Tuxedo. The plant and park are surrounded by a high stone wall.

The plant is protected from fire by numerous monitors.

What appears to some as an extravagance is a remunerative investment. The lake is a reservoir that receives the water used for power, from whence it flows to be used at the North Star mines and Allison Ranch mine.

At the collar of the shaft repairs are no longer necessary. In the mill and buildings there are no floors to wear out or timbers to decay; repairs are reduced to a minimum, maintenance and insurance accounts are small, and, above all, the influence of the surroundings invite a high class of labor, and system, order and neatness become a matter of course. A visit to the property by the officials and shareholders is no longer irksome, but more in the nature of a pleasure trip, and personal interest by those financially interested is a spur to the administration of any enterprise.

The oldest continuously worked gold mine in the United States after an active life of nearly fifty years is thus passing from its infancy, its growth no longer checked by lack of means of development. As long as its shareholders will be content to receive a reasonable interest return on their capital and will endeavor persistently to open up reserves in excess of extraction, their property will remain a model for California mining, and a monument when mining in California is no more.

Silver Smelting in Mexico.

NUMBER IV.

The fuel used is Laredo coal. The pots hold 425 bars of furnace bullion, at 96 pounds, and are supposed to turn out twenty tons of improved bullion; but they do not do it without refilling after skimming. The bullion is syphoned off into moulds, arranged in a semicircle around the pots, an arrangement borrowed from desilverizing establishments. The object of remelting the furnace bullion is to get the copper out of it and utilize it in the blast furnace, and also to be obtain a correct sample which is taken out of the swivel pot of the syphon. The continuous recharging of the dross obtained from the pots into the blast furnaces is an absurdity, as in the course of time the furnace bullion becomes so deteriorated that the syphon tap refuses to work. The plan of smelter No. 2 to a liquate its furnace bullion and put the dross through a separate furnace is decidedly preferable.

There are also two specially constructed platform scales in this building on which the bullion is weighed and reweighed. Tracks of 30-inch gauge connect the blast furnaces with the pots, the weighing floor, and the railway cars to be loaded with the bullion. Another track connects the dross dump with the ore shed.

In a place between the refinery and the calciners there is a covered kiln for baking flue dust bricks, which is arranged for burning Laredo coal. Directly behind the blast furnace building and parallel to it, but separated by a space of about 10 feet, is the ore shed in which the lead and silver ore beds are built up. Lengthwise it is divided into three unequal parts. The part nearest the furnace shed contains the hydraulic elevators on which the charges are lifted to the charge floor, and the weighing machines on which the charges are weighed up. The central part is occupied by a gangway for wheelbarrows, and a tramway on which materials are brought in trucks from a distance to the charge scales. The largest third is reserved for ore beds. Each quadrangle or bent formed by posts is called a space, and has a number by which the ore stored in it may be identified. There are usually two or three large lead ore beds, a like number of rich silver ore beds, a supply of roasted matte, flue dust bricks, dross, and barrings, kept in there. All other ores and materials are stored in the yard in the open air and made accessible by laying movable tracks (flying tracks) along the long sides of the beds.

Experience has taught that ores saturated with moisture give better results in the smelting furnace than dried ones, both in regard to tonnage and cleanness of slag. In accordance with this observation the ore beds are thoroughly drenched with water from hydrants placed near them. The ferruginous ores which have usually a clayey gangue retain then regularly about 12% moisture, while the quartzose and limey ones average from 3% to 8%. At some smelters the charge is soaked with water in front of the furnace door for the same reason.

The floor of the ore shed was originally made of wood, but it may be imagined that, with all the shoveling done on it and the action of the water drained from the ore beds, there was no end of repairing. This led to a trial of brick flooring, which proved an entire success. The brick must be hard-burned and laid on a foundation of slag concrete. A square meter of paving, including cement concrete, costs $2.98. Where brick is good and cheap ore floors of that kind can not be recommended too highly. In a good many smelters too much dirt is smelted, which is dug out of the ground on which the ore rests while shoveling it into trucks. Thus it may occur that more ore has been smelted than can be accounted for.

There are five hydraulic lifts or elevators, which receive their water directly from a steam pump. The elevator shafts are connected at the top with the charge floor by short bridges. Four elevators are arranged in pairs, and the fifth stands opposite the two end furnaces. Each pair of elevators serves five furnaces. The fifth is kept in reserve in case furnaces run too fast, or when any furnace is run on a special charge.

In front of the elevators there are three weighing machines of Fairbanks' make, so-called stock or charge scales, with seven beams each. They are set equidistant from each other, and opposite the centers of the elevator shafts. Each weighing machine can accommodate five furnaces, but it was generally so arranged that one machine served five, the second one four, and the third one furnace, which was run on secondary products. The other furnaces usually ran on the same ore charge.

The ores and fluxes were weighed up in this fashion: First, lead ore, which forms the largest part of the charge; then iron ore, then poor silver ore, then rich silver ore, then roasted matte, and, lastly, limestone. The lead ore was brought directly from a bed in the charge barrow, but the other materials were grouped around the scale platform in the order in which they were intended to be weighed up. A charge barrow comfortably holds 500 pounds of charge, and this was called a half charge, two of them being shoveled into the furnace simultaneously from opposite doors. The head weigher of each scale has to keep tally of the charges sent up on the elevator; besides, there is an automatic counter attached to the first ore beam. To prevent the scale platform from getting jammed by fine ore or little pebbles there is a pit under the scale, in which the spilled ore accumulates. This is cleaned out once a week. The scale must be tested for its correctness every day.

The slag added to each charge was brought over to the furnaces from the side facing their working front.

The fuel is weighed up on the charge floor. There are two platform scales for that purpose, one for five furnaces. The fuel is brought up to the charge floor in railway cars on an incline connected with a straight trestle bridge running along the front of the furnace building, and terminating in another incline at the other end. Six standard gauge cars could be placed on this trestle bridge, which afforded more than twenty-four hours' supply. But this arrangement is not to be recommended, on account of the constant danger of a railway accident. Besides, the trestles were of wood, and liable to be set on fire. The surplus of fuel was unloaded on the ground below the incline. The charge floor, having been intended originally for six small furnaces, was too small for the larger ones, and afforded no place for storage of fuel, slag or other necessary material in case of failure of the regular supply. Hence it sometimes happened that a wheelbarrow train had to be organized to bring up fuel on the incline from the stock pile until a switch engine could be procured. This is only one of the many vexations occurring almost daily in a Mexican smelter.

It is known that an admixture of charcoal notably increases the speed with which the charges descend in a furnace when a dense or dirty coke is used, or, in other words, it increases the tonnage, the goal of every smelter. With this idea in mind, mixed fuel was used at the Guggenheim works for several years. The charcoal was made in ovens on the line of the Monterey & Mexican Gulf Railway by an American company, and, unlike the wretched stuff turned out by Mexican coal burners, was of very good quality. But the irregularity of supply, caused by wrangling with the railway officials, and the inflammable nature of the charcoal, finally led to its abandonment, except for blowing-in and domestic purposes. It was delivered at the works for $11.18 per metric ton, which corresponds to $10.14 per 2000-pound ton.

The prediction of some metallurgists that mineral coal would largely supersede charcoal in mixed fuel received no recognition in these works. If coke containing gaseous matter impedes reduction, how much more will this be the case with bituminous coal, not considering the ash, which is always high in the raw material. Anthracite coal is very dense and not porous, requires a blast of high pressure, and splinters, thereby slowing the descent of the charges. Hence this material is also to be rejected.

The only coke made in the country is the San Felipe of the Sabinas coal field, on the line of the Mexican International Railway. It is of such poor quality that it has not found favor with custom smelters, and is only used by copper smelters and lead smelters that do not have to treat purchased ores. An analysis of the Sabinas coke afforded fixed carbon 79, ash 19.2, water 1.5, total 99.7.

It costs delivered at Monterey $10.84 per metric ton, which is equivalent to $9.83 per 2000-pound ton. In order to test quality and prices thoroughly coke was imported in large quantities from Pennsylvania, West Virginia, Indian Territory, Wales and Belgium. European coke had to be left out of the question on account of its price, being higher by $5 a ton than any of the others, and also on account of the long sea voyage. Pennsylvania coke is too dense for rapid work, and objectionable on account of the high ash (12%); Indian Territory coke is too friable. Hence there was only to choose between Alabama and West Virginia. Analyses of these cokes are here appended:

		West Virginia.	
	Alabama.	Pocahontas.	Loup Creek.
Water........	0.23	1 092	....
Volatile matter	0.64	2.150	2.5
Fixed carbon..	90.00	89.078	91.9
Sulphur.......	0.80	0.656	....
Phosphorus....	none	0.006	....
Ash...........	8.00	7.024	5.6
	99.67	100.006	100.0

The average price of all the United States coke laid down at Monterey works was $12.64 per 2000-pound ton.

Better transportation facilities decided in favor of the West Virginia coke. It fills all reasonable requirements in regard to furnace speed, reduction power, and low percentage of ash. Its only drawback is its softness and consequent heavy abrasion in transit, which amounts to at least 7% in weight. The limestone is brought in ox carts from a quarry at Topo Chico, 3 miles distant, and is delivered wherever required at 85 cents a metric ton. As the cart driver unloads this himself, this is cheaper than receiving it by rail, when laborers of the smelter would have to unload it. The lumps are, however, too large for convenient weighing, and have to be broken into pieces not exceeding eight pounds. The stone is then loaded on trucks and trammed to the charge scales. The limestone is of a dark grey color, and is incorrectly called "black marble." It contains from ½% to 1% of silica and from 54% to 55% of calcium oxide. Limestones of such purity are not often available at a smelter. Usually they contain more silica, quite frequently notable quantities of magnesia, alumina and iron, and sometimes even nodules of marcasite. The latter substance greatly interferes with the production of a correct slag if unobserved.

In every smelter run on commercial principles the great problem is to put through the largest possible quantity of that ore from which the greatest profit is derived with the least loss. In a custom smelter this is, of course, the siliceous and sulphide ores, while in smelters attached to one or more mines it is the ore from these mines of which "tonnage" is required.

At the Guggenheim works the average ore charge for the year 1896 consisted of 33% of siliceous and sulphide ores, 30% of lead ore, 32% of argentiferous iron ore and 5% of roasted matte.

The matte is in the proportion in which it was produced. The limestone added as flux amounted to 7.82% of the weight of the ore.

The lead ore beds were made up so that they contained about 27% of lead, and were of a basic character. Since the principal lead ore supply came from the Sierra Mojada (Encantada mine), where the lead contents have dwindled down to 20% and less, it is evident that ores richer in lead had to be put on the beds to attain the desired 27%. The only ore of that kind available in quantity was the ore from the firm's Reforma mine in the State of Coahuila. This ore was, however, quartzose, and contained also barium sulphate. Other rich lead ores could only be picked up in small lots. Whenever the Reforma failed to come in the lead contents would drop at once. In the following are given examples of the composition of some lead ore beds:

	SiO_2.	Fe.	CaO.	Zn.	S.	Pb.	Ag. oz	Moisture.
I...	13.6	21.6	3.3	2.3	1.5	27.0	15.4	12
II...	19.2	19.3	4.2	3.0	3.0	21.1	26.9	12
III...	6.5	28.5	2.0	1.2	1.0	18.7	7.8	12

In some of the ores composing these beds, notably in Encantada, there is also arsenic, originating from arsenate of lead, and sulphate of baryta. The arsenic is only interesting from a commercial point of view, and the sulphate of baryta is present in such small quantities that it does not exercise any influence on the slag.

Bed No. I is of normal composition.

Bed No. II is abnormal in regard to lead and silver, and

Bed No. III is very bad, and would indicate that something unusual had happened.

The basicity of No. III shows at once that a large addition of siliceous ore will be required to satisfy it, which will lower the lead percentage of the furnace charge to the danger point.

The ferruginous ores ran about as follows:

	SiO_2.	Fe.	CaO.	Zn.	S.	Pb.	Ag. oz.	Moisture.
IV.......	5.5	40.5	2.8	2.6	1.2	8.1	2.5	8
V.......	6.6	35.5	3.0	1.5	1.2	9.0	2.3	8

No. IV is from the San Pedro mine, near Monterey.
No. V is from the San Pablo, near Monterey.

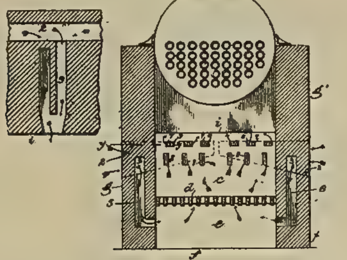
(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued August 7, 1900.

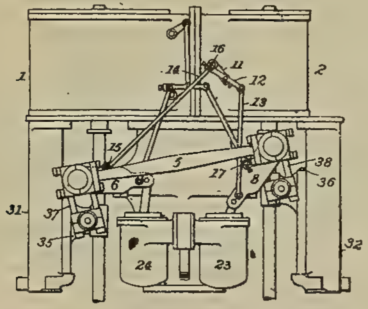
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

SMOKE-CONSUMING DEVICE FOR FURNACES.—No. 655,221; G. S. Gallagher, New York.



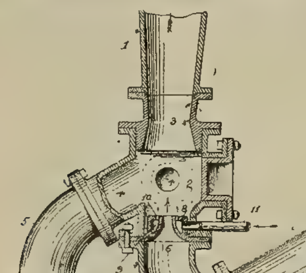
Furnace combination with grate bar and bridge wall, of entrance flues 2 3 from opposite sides through bridge wall, series of parallel double or return flues 7 8 connected at inner ends, air flues 9 parallel with flues 7 and connecting at one end with entrance flues 2 3 and at other end forming a common exit opening with flues 7, and branch flues 5 6 through side walls of furnace and opening beneath grate bars.

PUMPING ENGINE.—No. 655,232; C. L. Heisler, Erie, Pa.



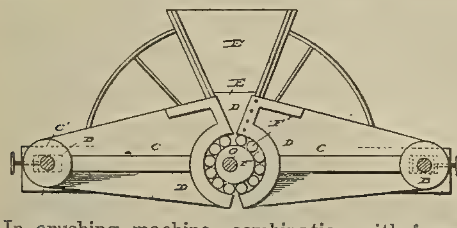
Combination with pair of steam cylinders and their reciprocating piston rods, of compensating mechanism comprising pair of rocker arms each mounted upon fixed pivotal support, connections between rocker arms and respective piston rods, and floating link connecting free ends of rocker arms, they and floating link being so proportioned and pivotal points of rocker arms so located that when either rocker arm and floating link are in common plane, which is at right angles to their planes of movement, remaining rocker arm will be out of said plane.

HYDRAULIC ELEVATOR.—No. 655,615; G. H. Evans, Oroville, Cal., assignor to Risdon Iron and Locomotive Works, San Francisco, Cal.



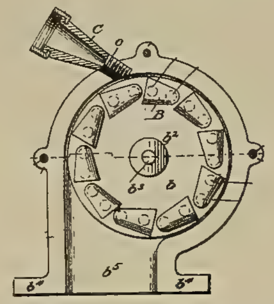
Hydraulic elevator, combination of base chamber or seat having suction-opening, an elevator-pipe connecting with chamber or seat, an ejector-pipe, casing in chamber provided with part constituting nozzle for ejector-pipe which nozzle extends to top of casing and having an annular air-chamber provided with one or more openings through casing-top exterior to nozzle and through which air enters base-chamber or seat, an air-pipe connecting with air-chamber.

ORE CRUSHER.—No. 655,311; T. Smith, Hopewell, N. M.



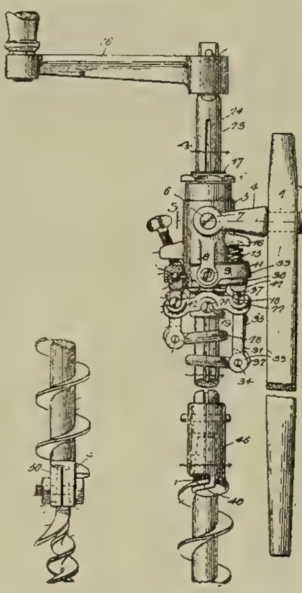
In crushing machine, combination with frame, of crushers pivoted thereto at their outer ends, each having semicircular recess in its inner end, an eccentric within recesses, rollers interposed between eccentric and walls of recesses, shaft secured to eccentric and mounted in longitudinally movable boxes within frame, whereby rocking motion may be imparted to crushers from eccentric.

IMPACT MOTOR.—No. 655,271; W. H. Pfeiffer, York, Pa.



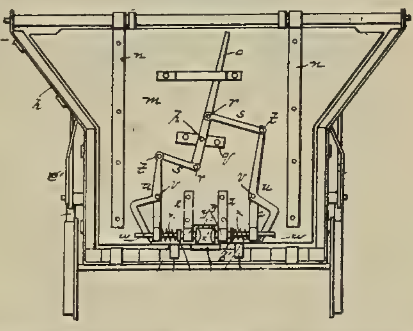
A motor comprising sectional casing partially inclosing double-bucketed turbine wheel, buckets being arranged on opposite sides of disk or plate, constituting body of wheel, buckets on one side of disk discharging into those on opposite side thereof, and at about midway of their length, and vice versa, disk being housed between sections of casing, and buckets working in alined circumferential grooves of like size, formed in inner opposing faces of sections.

MINING DRILL.—No. 655,292; J. Wynne and V. V. Haidacher, Wilkesbarre, Pa.



Drilling machine, combination with support, sleeve revoluble therein, drill shaft adapted to move longitudinally in and rotate with sleeve, of rocker on support, means to cant same, rocker yokes on sleeve, feed rings on drill shaft, and connections between feed ring and canted rocker, engaging and actuated by rocking yokes.

END-GATE FASTENER FOR MINING CARS.—No. 655,505; L. S. Morrow, Smithton, Pa.

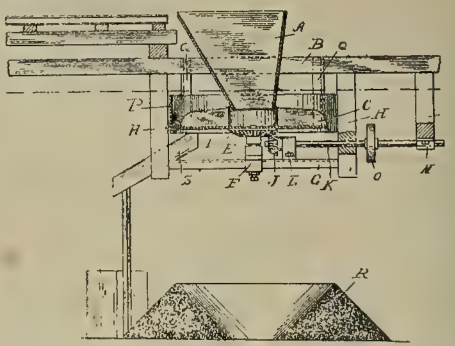


Combination with car, swinging end-gate and stop-bars n′, n′ carried by gate, of pivoted hand locking-lever o, bars s, s, pivoted thereto, pivoted angular levers u, u, having upper ends pivoted to bars s, s, sliding bars x, x having slots in outer ends to receive free ends of angular levers, eye-lug x′ to receive inner ends of bars x, x and springs for holding bars x, x normally in engagement with eye-lug.

PROCESS OF REFINING MINERAL OILS.—No. 655,500; T. Macalpine, London, England.

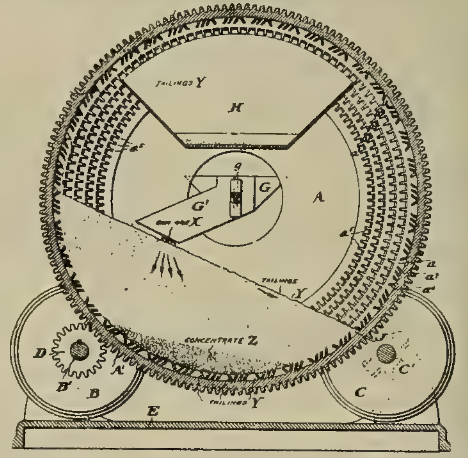
Refining petroleum and mineral oils, which consists in subjecting them to action of compound of acetylene and manganese, with or without addition of other purifying agents, allowing the mixture to settle, with or without agitation, removing oil and distilling it.

ORE MIXER AND SAMPLER.—No. 655,478; J. M. Damm, Durango, Mexico.



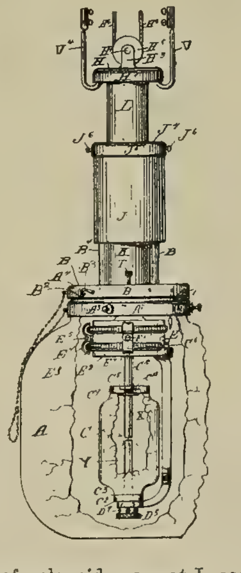
Combination with hopper, of horizontally rotating member below same, comprising central receptacle into which delivery end of hopper projects, and plurality of radial spouts adapted to withdraw from receptacle and distribute same by centrifugal force, member surrounding rotating member of greater diameter than sweep of latter against which ore is adapted to impinge and drop, whereby heap of uniform grade is adapted to be formed, and inclined radial trough mounted below rotating member and extending outwardly from point within sweep thereof and intersecting circle of falling ore, trough being adapted to receive small portion of ore and deliver same at a point beyond edge of main heap.

PROCESS OF CONCENTRATING ORES ANHYDROUSLY.—No. 655,495; S. M. Lissau, Philadelphia, Pa.



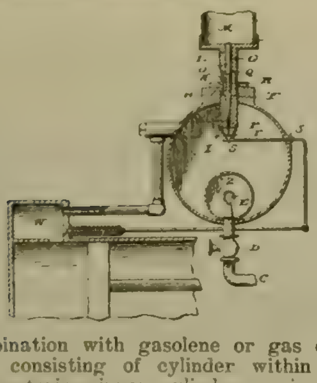
Anhydrously concentrated comminuted material containing precious metal, consisting in continuously agitating mass of material, forming strata of its particles in accordance with specific gravity thereof; retaining concentrated product at bottom of mass; maintaining layer of dry waste material above concentrated product by supplying raw material to mass during its agitation; continuously removing lighter waste material, in dry condition, from upper strata of agitated mass, through latter and beneath concentrated product at bottom thereof; and discharging waste material exterior to mass.

ELECTRIC ARC LAMP.—No. 655,266; J. S. Nowotny, Madisonville, Ohio.



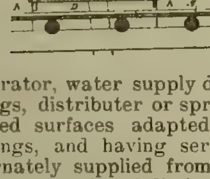
Combination of solenoid magnet I, cap J^4, tube G, frame piece B, interior piston N carrying tube O, embracing slidable carbon holder P and core S, embracing tube O, and tube R, supporting tube O, and set screw for setting tube R at desired place on tube O, core being located relatively to solenoid magnet as shown, and box M, supported by slidable core, and containing means in connection with stationary tube M^3 for releasing its hold upon carbon and regaining it as core shifts, and frame B, supported on tube O, and frame E, E^2, supported by frame B, and carrying tube M^1, and rheostat supported by frame E, and encircling carbon at that point, viz., below core and magnet, and set screw T in frame B above box M, and in path of same.

VAPORIZER FOR GASOLENE ENGINES.—No. 655,407; J. G. MacPherson, Philadelphia, Pa.



In combination with gasolene or gas engine, of vaporizer, consisting of cylinder within cylinder, flame jet entering inner cylinder, spring-actuated gasolene-admitting valve located above inner cylinder in top of outer cylinder, lever fulcrumed upon exterior of outer cylinder and having free end within and one without cylinder, guard or plate carried by lever near free inner end thereof to prevent gasolene from flowing too far upon lever, and means for operating lever to cause its inner end to contact valve to admit gasolene to be vaporized.

CONCENTRATOR.—No. 655,470; W. H. Washburn, Oroville, Wash.



In a concentrator, water supply device having discharge openings, distributer or spreader having oppositely inclined surfaces adapted to reciprocate beneath openings, and having series of divergent channels alternately supplied from water box, distributer also having series of discharge openings at its opposite edges, and gates by which amount of water delivered to the channels is regulated.

Copper Statistics.

The following table gives the production of copper in the United States for the years 1897, 1898, 1899, and shows the stock on January 1, the imports, the exports, the home consumption, and the stock on hand December 31:

	POUNDS OF FINE COPPER		
	1897.	1898.	1899.
Montana	237,158,540	216,979,334	237,953,951
Michigan	145,839,749	156,669,098	155,845,786
Arizona	81,019,922	110,823,864	125,377,758
Other States	33,169,272	44,412,561	52,633,699
Copper in sulphate	4,182,812	7,015,375	9,507,897
Total dom. prod.	501,370,295	535,900,232	581,319,091
Stock January 1	83,600,000	48,882,143	54,361,470
Imports	26,938,254	43,479,288	94,568,050

Deduct consumption	274,400,166	274,135,139	391,602,111
Stock December 31.	48,882,143	54,361,470	88,722,559

It will be seen that the stock of copper January 1, 1899, was 54,361,470 pounds, and the stock on hand December 31, 1899, was 88,722,559 pounds, an increase of over 34,000,000 pounds. This increase was due to the falling off of exports, which were 50,000,000 pounds less in 1899 than in 1898. This decrease was due to the fact that copper, being higher in price than for some years previously, the foreign consumers used up their available stocks, bought at a lower figure, but after January 1, 1900, these stocks being practically exhausted, they commenced placing large orders for copper in the United States markets, which during the past six months have very largely increased the exports of the metal, the copper exports from January 1 to June 30, 1900, being four-fifths of the amount exported during the twelve months ending December 31, 1899. The home consumption of copper in 1899 was over 117,000,000 pounds greater than in 1898.

This table also shows that Montana, Michigan and Arizona produced nearly nine-tenths of the production of the United States, or nearly one-half of the world's production. In comparison with 1897, Montana's increase was less than 1%, Michigan's not quite 7%, and Arizona's over 50%.—Boston News Bureau.

A California Stamp Mill.

TO THE EDITOR:—Please describe a California stamp mill so that one who doesn't know anything about it can get some idea of how it is built and how it works.
Boston, Mass., Aug. 2, 1900. J. D. S.

It would be easier to describe it to one who does know something about it, as any description of it must necessarily be technical. Our Boston correspondent would do well to get some catalogues from our advertisers, which give excellent illustrated descriptions of stamp mill practice.

However, the following is given in answer to the request:

California stamp mills are built in batteries usually of five stamps each, and ordinarily at first the mill consists of one battery only, but is so arranged that additional batteries may be placed in position when the mine is found to warrant the expenditure. The price of the mill is estimated at so much per stamp, usually costing about $1000 per stamp about the time the mill is ready to begin crushing ore (though there is a difference in these things. On page 188 is described a new Arizona stamp mill—a 40-stamp mill—that has cost $150,000. Our Boston inquirer might read that article in connection with this.)

The weight of the stamps runs from 650 to 1200 pounds each. A medium-weight stamp, about 750 pounds, is most commonly used and is suitable for crushing ordinary ore. The estimate of cost includes the boilers, engines, amalgamating plates and all else that is necessary to handle free-milling ore.

Each battery consists of an integral cast iron mortar having a rectangular bed, within which dies are arranged. Each die consists of a square base, having upon its top a cylindrical projection which is just the size of the stamp and arranged to receive the blow from its respective stamp. A layer of sand or ore is placed upon the bottom of the mortar before the dies are placed in position, to form a cushion to prevent the blows from the stamp breaking the mortar. The mortar is cast with a heavy frame above it, and in this frame are provided guideways in which play the stems of the stamps; above this frame is another wooden frame, in which play the upper ends of the stems. Between the two frames is arranged the cam shaft, which is provided with one cam for each stamp. The cams are shaped like a heavy, strong sickle and are from 8 to 14 inches in length. The handle end is provided with an opening through which the cam shaft passes, and a key secures it rigidly in place. The stamp stems are round shafts of iron, and in a battery of 750-pound stamps the stems are about 3¼ inches in diameter. To the lower end of the stem is keyed a cast base, having a socket in which fits the stem of the stamp shoe, which is from 6 to 10 inches in diameter and about 1 foot in length when new. This shoe is also keyed in the socket so it can be easily removed when necessary. Upon each stamp stem above the cam shaft and in the path of its respective cam is keyed a collar called a tappet, and at each revolution of the cam shaft each cam engages with its respective tappet and lifts the stamp until the cam passes from under the tappet and lets the stamp drop. The cams are arranged spirally around the shaft, so that the stamps are raised and dropped in regular succession, and not all at once.

The rear of the mortar is closed by a thick, wooden plank, which is wedged tightly in grooves in the mortar, while the front is closed by means of a screen of wire cloth or of slotted sheet metal. These screens are of different degrees of fineness, running from 40 to 100 openings to the inch, and the fineness of the screen depends upon the character of the ore. When this gold is coarse a 40-mesh screen will answer, but if the gold is fine a 60 or 80-mesh screen will be required. Very fine gold may require a 120-mesh screen, but this is unusual. The screens are fastened on frames which fit into grooves in the mortar box, and are wedged firmly in place by iron wedges. Strips of blanket are tacked along the edges of the frame, so that when in place the joints will be water tight, and all the matter which escapes from the mortar box will have to pass through the screen.

The drop of the stamps—that is, the distance they fall—is regulated by adjusting the tappets of the stamp stems. A 7½-inch drop is enough to crush ordinary quartz, but hard quartz sometimes takes a 9-inch drop or more. Each stamp is arranged to drop from fifty to ninety times per minute, dependent upon the distance it falls. If the drop is 9 inches and the speed ninety times per minute, the cam will usually catch the tappet before the shoe hits the die, and of course the ore will not be crushed if this is done, the cam receiving the full force of the blow.

The ore is placed in a large hopper, which has its lower end closed by one side of a large horizontally arranged iron plate, which is connected by means of cog wheels; a ratchet and an arm with a plunger which extends upwards far enough to be struck by a tappet on one of the central stamp stems. This plunger can be regulated so that the tappet will only strike when the stamp has sufficient ore beneath it to keep it from pounding iron, as it is termed, when the shoe hits upon the die itself. When the tappet hits the plunger plate it is rotated an inch or two and the ore is carried against a scraper, which causes it to fall into a mortar box; when too much ore gets beneath the stamp the tappet does not strike the plunger and no more ore is fed to the stamps until enough has been crushed and washed from the mortar to allow the tappet to again strike the plunger.

In front of the mortar is arranged the apron and amalgamating plate, upon which is discharged all the crushed ore which passes through the screen. Amalgamating plates are also arranged in the battery. They are of copper and plated with silver. Below the apron is arranged a long sluice box, which sometimes has its bottom covered with amalgamating plates, over which the ore all passes on its way to the slime pond. If the ore is hard to work, it is common to run it through mullers or large cast iron basins, each having a rotary grinder therein. When everything is ready the mill is started. Nearly all the free gold is amalgamated by the quicksilver on the plates in the battery. Each stamp should crush about one ton of ore in eight hours.

Geo. W. Pennington.

In last Saturday's issue appeared a brief biography of Mr. Geo. W. Pennington, who died at his residence in San Francisco, Cal., on the 8th inst. Herewith is a good portrait of this pioneer steel manufacturer, a man of untiring industry and sterling character, who for half a century had been prominent in the progressive industry with which he was identified, and who aided in the upbuilding of the commonwealth.

Quantitative Test for Molybdenum.

TO THE EDITOR:—Please publish through "Concentrates" a quantitative test for molybdenum.
Walla Walla, Wash., Aug. 1.

Correct reply is too detailed for answer in "Concentrates."

To estimate molybdenum quantitatively it must be obtained as a neutral molybdate, which is then precipitated with a neutral solution of mercurous nitrate. The yellow precipitate which falls down is washed with a solution of mercurous nitrate, dried, and then either heated in a stream of hydrogen, when molybdenum dioxide is formed, or it is ignited with a weighed quantity of anhydrous lead oxide until all the mercury is driven off. The increase of weight of the residue gives, then, the amount of trioxide present. To determine the amount of molybdenum available in the ore molybdenite, about 1 g. mineral is digested with 25 c.c. concentrated nitric acid for two hours in an Erlenmeyer flask, in order to convert the mylybdenum into molybdic acid. The latter is dissolved in ammonia and filtered off. The residue is treated a second time with nitric acid and ammonia. The combined filtrate is then acidified with nitric acid and evaporated to dryness. The molybdic acid is separated from the dry ammonium nitrate by leaching with 50% alcohol, which dissolves only the ammonium nitrate. The molybdic acid is then collected upon a weighed filter, or, better, is dissolved in normal ammonia and the excess of alkali titrated with acid. Molybdenum may be estimated indirectly by adding an excess of lead acetate to a solution of alkali molybdate, filtering off the lead molybdate and determining the amount of lead in the filtrate, by any trustworthy volumetric method of determining lead.

Schindler describes in the Journal of the American Chemical Society, November, 1895, a method whereby lead acetate is added to an acidified solution of a molybdate until the latter ceases to give any coloration on a test plate with tannin. Brearly has modified this method: Add lead acetate and use the tannin reaction as long as available. Pour a little of the hot solution through a ribbed paper, test the filtrate first with lead acetate and, if necessary, with sodium molybdate. Generally the first test will show that some molybdenum is still unprecipitated, and the intensity of the cloudiness indicates, approximately, the amount. The one or other reagent is added as required, and the solution tested in this way until with absolute certainty neither sodium molybdate nor lead acetate is present in other than negligible quantities. As the solution is passed through the same filter until the end is reached, there is no loss through absorption of the paper. Large amounts of metallic salts do not interfere.

Stamp Mill of Octave G. M. Co, Weaver, Ariz.

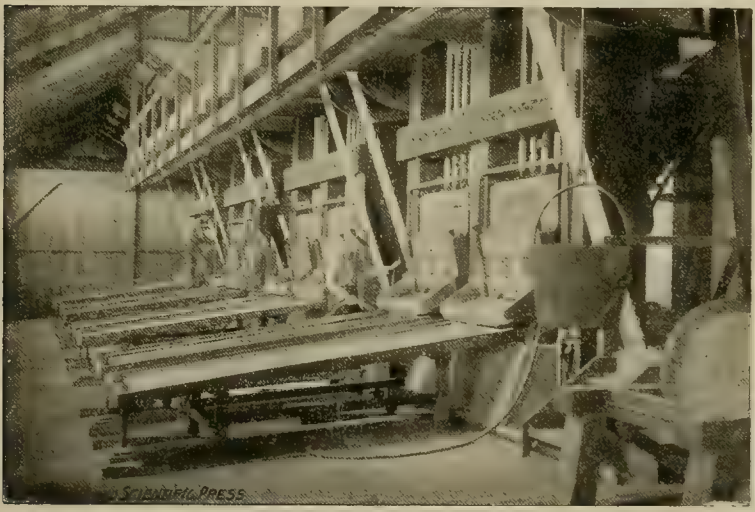
Written for the MINING AND SCIENTIFIC PRESS by D. E. BIGELOW.

The Union Iron Works of San Francisco have just completed a 40-stamp mill for the Octave G. M. Co., near Weaver, Ariz. It is more than usually complete in every detail, and, representing modern construction in plants of its class, is of more than passing interest.

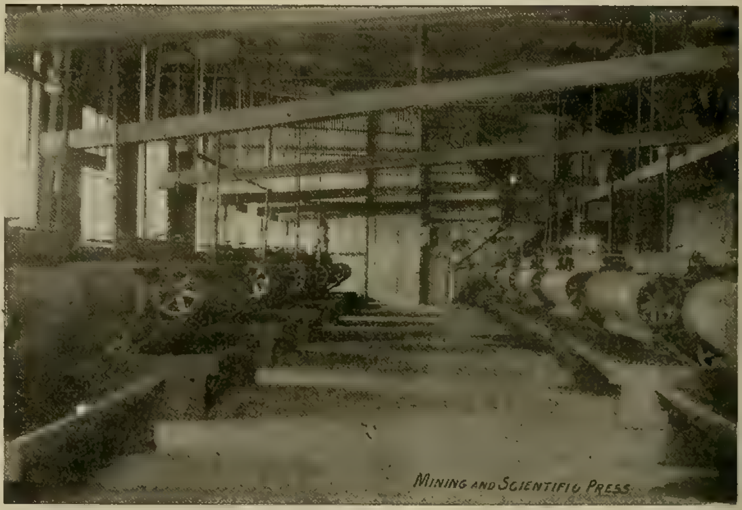
40-Stamp Mill, Octave G. M. Co., Weaver, Arizona.

This picture was taken by moonlight. 1¼ hours exposure, from 2 to 3:15 A. M., July 12, 1900. It is a good example of moonlight photography, and shows the clearness of the Arizona sky.

175-Ton Cyanide Plant, Octave G. M. Co., Weaver, Arizona.



Octave Battery Room, Weaver, Arizona.



Octave Mill Concentrator Room, Weaver, Arizona.

Octave Mill Concrete Mortar Blocks, Weaver, Arizona.

Octave Mill Concrete Mortar Blocks, Weaver, Arizona.

The cost of the entire plant, including crushers, 40-stamp mill, concentrators, steam power, electric light, 175-ton cyanide plant, return pumping plant, machine shop and assay office, was about $150,000. It was designed and built under contract by the Union Iron Works and turned over in running order after trial run of ten days.

The property was known as the old Rumer mine and had been worked for several years in a small way until two years ago. The property was examined and reported upon by D. J. Jones, and, upon his recommendation, was purchased by the Octave G. M. Co. and active development work commenced.

The mine is situated about 11 miles east of Congress, Ariz. The veins in this belt all strike east and west and dip to the north about 25°. The Octave vein matter is firm, white quartz, containing sulphurets of lead, iron and zinc. The walls are clearly defined, there being a little gouge on both sides. The formation is decomposed granite and diorite.

The ore is hauled in two-ton cars by a mule over the trestle to the crusher building, about 200 feet from the mouth of the tunnel. There are four grizzlies and two 10x16-inch jaw crushers, so arranged as to provide storage for about forty tons of ore above crushers and 500 tons below—all of which is distributed by gravity through steel lined chutes into the mill bins proper, which have additional capacity of 700 tons. The crushers are driven by a special steam engine located below.

The batteries are of the back-knee type—each 5-stamp battery being driven independently by belt from line shaft below the feeder floor. Other new features are cast iron sectional stamp guides, iron frame hanging ore feeders, solid concrete mortar blocks, movable apron plates and sand bucket running on trolley along front of batteries to clean-up room. The clean-up rig is treated as an important adjunct. The room is 24x30 feet, forming an extension to the battery room; in it are located an amalgam barrel, a brick retort and melting furnace, work benches, wash trays, amalgam strainers and safes.

The floor is cement concrete, laid with slope form all sides to a sump in the center, from which lost quicksilver and amalgam are easily recovered.

The concentrator room also has a cement floor, with the open tailing sluices molded in solid cement. The floor slopes from all sides to the sluices, and all leakage is washed down with the tailings through an iron pipe to the settling tanks, from which the water is pumped back to the battery supply tank above the mill.

The tailings are all treated by the cyanide process, with some interesting modifications from the usual practice. This will be the subject of a later article.

The mill is driven by steam power generated in a battery of three 70 H. P. boilers, with independent settings, allowing for one boiler to be constantly in reserve.

The fuel at present is coal; it is hauled from the railroad and dumped from wagons into bunkers having 250 tons capacity, discharging by gravity to fire room.

The engine room, located between boiler room and mill, has a cement floor, with walls and ceiling double-boarded, with tarred paper between, protecting the machinery from dust and diminishing the noise.

A compound Corliss engine drives the mill, being coupled direct to battery line shaft. In the engine room is also located an electric generator of 500-light capacity, driven by an automatic compound engine, furnishing lights for mill, mine and offices and power for circulating pumps at cyanide plant. The engine room is nicely finished, all the interior being painted white, and, with marble switchboard, ornamental gauge panel, oil stands, pictures, etc., marks quite an advance over the ordinary mill engine room.

One of the most important features in connection with the plant is the machine shop, occupying a special building 24x80 feet, containing lathe, dull press, emery grinders, bolt cutter, forges, etc., and complete stock of iron, pipe and fittings, as required for general repair work about the mine and mill.

It is not often that a mine is so thoroughly equipped in the beginning; smaller plants are usually erected, and are added to from time to time; but the Octave people have recognized the economy of making their improvements first—the development of the mine having fully warranted the expenditure.

New Discharging Device for Transfer Coal Barge.

The steel hull of the old U. S. monitor Comanche is now being used by the Pacific Coast Company in San Francisco bay as a transfer coal barge. After being sold by the Government the vessel was dismantled and the machinery entirely removed. It now has a carrying capacity of 1200 tons of coal, is 190 feet long, 36 feet beam and has 20 feet depth of hold. The hull is of ½-inch steel, with bulkheads fore and aft of the coal space. The deck was removed, leaving only the cross-tie braces. On deck, at the stern, is located a 40 H. P. vertical boiler and the unloading machinery.

General View of Barge, Showing Grab Bucket About to be Dropped.

Grab Bucket and Trolley.

The device for discharging was designed by the California Wire Works, San Francisco, and consists of a 2240-pound grab-bucket, operated by means of a movable "trolley" running on a track cable supported by wooden structures at either end of the barge.

The track cable is made of plow steel 2¼ inches in diameter, being built up of seven strands of seven wires each, one strand of which is substituted for the usual hemp center. It is supported by grooved cast iron saddles bolted to wooden posts at bow and stern of the barge. These posts, 133 feet apart and 42 feet high, are built of 10x14-inch timbers, braced with 10x10-inch timbers, and are secured by four 1¼-inch and two 1⅝-inch rod-steel back stays, which are fastened to straps riveted to the hull. The ends of the track cable are each attached to two 1½x4-inch back stays by means of a thimble, spliced into the end of the rope, and a turnbuckle by which the required tension is maintained.

On the track rope runs the trolley, the frame of which is made of ⅜-inch steel plates. This is supported by two 14-inch track sheaves above, and maintained in position by two 10-inch guide sheaves below the track cable. It is moved fore and aft by means of an endless wire rope ¾ inch in diameter passing back and forth over head sheaves near the tops of the supporting posts to a grooved drum on the hoisting engine. In the lower portion of the trolley are two sheaves 18 inches in diameter. Over one of these passes the rope for closing and hoisting the bucket, and over the other passes the rope for opening and lowering the bucket; thence both ropes pass over head sheaves in the stern post to their respective drums on the hoisting engine. These ropes are ¾-inch crucible cast steel, composed of six strands of nineteen wires each about a hemp center. The power operating this device for raising, conveying and dumping the bucket consists of a 90 H. P. triple-drum, link-motion, double-cylinder 10x12-inch engine located at the stern. One man operating this engine can discharge into the hopper amidships two loads a minute.

From the hopper the coal gravitates through chutes to elevating buckets on either port or starboard side. These buckets, which are of the same capacity as the grab-bucket, travel in vertical guides to a maximum height of 50 feet.

When loading, at the bottom of the guides, these buckets rest upon scales, where the weight is taken.

After receiving its load the bucket (which is of the side-dumping type) is raised by an auxiliary engine located under the hopper and dumped automatically by movable trips into a chute stationed at the desired height. This chute, 24 feet long, extends over the side of the barge at an angle of 40°, and can deliver coal into a vessel or bunker at a maximum difference in deck levels of 30 feet.

Grease on Quicksilver.

Written by W. S. WELTON

One of the most potent enemies to amalgamation is fatty or resinous substances. Probably there are few more expert washers of gold than the South American miners, and they are so fully aware of the bad effects of grease in the catching of gold that they are exceedingly jealous of trusting their batea to the hands of a stranger. The South American miner hides his batea in the thatch of his house for fear that his wife or children may get it, and carefully washes his own hands with sharp river sand before he commences work, for fear of the smallest quantity of grease interfering with his operations.

Strangers, on seeing auriferous sands panned for the first time, can hardly ever resist the temptation to pick out with their fingers the colors or specks of gold as soon as they appear, and so soon as they do this many of the specks of gold, and even a portion of the black sand accompanying these, will rise to the surface of the water and continue floating upon it until the miner, with some difficulty, causes these particles to fall by spraying water upon them with as much force as possible. The above effects are apparently caused by a minute portion of grease from the fingers becoming attached to the particles of gold and sand. The disastrous effects which may be produced in the amalgamation of gold and silver by a minute portion of oil, petroleum, grease or resin in the water are remarkable. These substances appear to be specially attracted to gold and mercury, and for this reason at hydraulic mines it has been found necessary to prohibit the washing of clothes in the ditches, or the washing of plates after the men's dinners, in any of the streams dumping into the ditches or sluices. When the surface of the gravel banks has been previously occupied by camps or dwelling houses, the mercury in the sluices becomes sickened by the grease resulting from the surface soil upon washing such portions of the bank. The continual wearing away of the blocks and linings of the sluices sets free a considerable portion of gum or resin, which adheres to the gold and mercury, and is detrimental to amalgamation.

Mercury contaminated with grease or resin becomes too sluggish to run. Comparatively large grains of gold will float upon its surface without being amalgamated. Its brightness is changed to a dull, leaden color, and it will flour easily. The distillation will not purify mercury or grease or resin, as these substances pass over in retorting and condense again. Under these circumstances the writer has found great benefit from frequently washing the mercury in a strong solution of potash obtained by leaching wood ashes; the flouring and sickening are thus overcome, and the yield of silver or gold much increased.

Recent Additions to the Exhibits of the California State Mining Bureau.

Uranium ocher, Rock Creek, Colo.; John H. Andrew.

Jamesonite, variety "feather ore." Sulph. antimonide of lead, from the Manhattan quicksilver mine, Napa county, Cal.; R. B. Knox.

Native silver, a beautiful arborescent specimen from Silver Islet, Lake Superior, Canada; F. N. Gibbs, M. E.

Coarse placer gold from the Santa Ana mountains, Orange county, Cal.; W. L. Watts.

Cubrical placer gold from the Wandi diggings inland from Port Darwin, North Australia; Bertram Hunt.

Gold quartz, rich in free gold, from Downing's mine, Ash creek, Siskiyou county; J. Downing.

Cinnabar in calcite, showing crystals of calcite stained red by cinnabar. From the recently opened quicksilver mines at Terlingua, Brewster county, Texas; Walter P. Jenney, M. E. An illustrated description appeared in the issue of July 21st.

Auriferous clays, Pioneer mine, Bodie, Mono county, Cal.; Hugh Gorman.

Scheelite (tungstate of calcium), from Scott Bar, Siskiyou county, Cal.; Martin Andrews.

Molybdenite, from the mines of the Castle Hill Co., Whatcom county, Wash.; A. M. Dewey.

Joseite, a rare seleno-telluride of bismuth, Brazil; W. H. Kobbe.

Augite crystals from St. Paul's island, Alaska. Collected by Prof. Geo. Davidson and presented by W. H. Kobbe.

Chloropal, Silver Peak, Esmeralda county, Nev.; H. W. Turner.

Margarite, Gold Cliff mine, Angels, Calaveras county, Cal.

Cobaltite from a copper mine in Lewis district, Mariposa county, Cal.; Dr. G. F. G. Morgan.

Aragonite from a deposit recently cut in an old quicksilver mine near San Jose, Cal.; A. G. Col.

Kobellite, an ore of bismuth from Washington; A. H. Halloran and W. H. Kobbe.

Pisanite, a sulphate of copper and iron, Gonzales, Monterey county, Cal.; J. C. Lazier.

Placer gold, Snow Bros, hydraulic mine, Newtown, El Dorado county, Cal.; H. Snow.

And numerous other specimens of gold quartz, copper ores, iron ores, etc.

In addition to the foregoing there has been recently installed in the museum of the bureau a life-size full-length portrait of the noted prospector, Ed. Schefflin, discoverer of Tombstone, Ariz., and other rich mining districts; also his pick, shovel, hammer, etc., and cabinet of specimens collected by him, all of which are loaned to the bureau by Mrs. Schefflin.

THE ninth annual convention of the California State Miners' Association will be held in San Francisco on Nov. 19th, 1900.

The Bell Gyrating Disc Engine.

Written for the MINING AND SCIENTIFIC PRESS.

Ever since the steam engine came into general use, it has been the aim of steam engine builders to construct an engine capable of high speed without the attendant vibration caused by the reciprocating type, and to that end numerous types of rotary engines have been built. But, while this class of machine may have been satisfactory in that respect, their excessive consumption of steam has, up to the present, prohibited their use on a commercial scale.

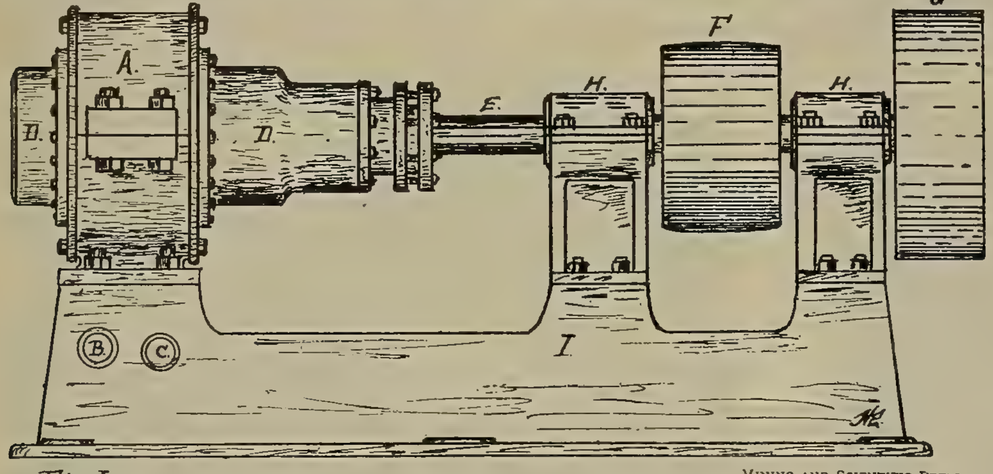

Fig. I.

MINING AND SCIENTIFIC PRESS

The Bell gyrating disc engine, herein described, is manufactured by McFarlane & Co., Denver, Colo. It has all the advantages sought for in a rotary, and, it is claimed, has none of its failings, but at the same time embodies the available good points of the reciprocating piston engine, inasmuch as the steam acts on its piston with a direct and positive pressure, susceptible to steam cut-off and the use of it expansively.

This is a distinct departure from all forms of the reciprocating piston engines and might be termed an engine with a continuous stroke. This fact, together with its few moving parts and simplicity, causes it to be considered by its manufacturers as an ideal machine wherever steam or compressed air can be utilized.

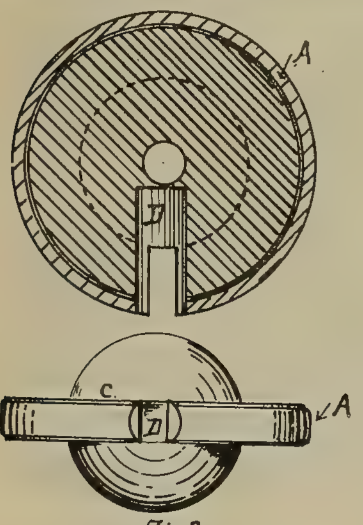

Fig 2.

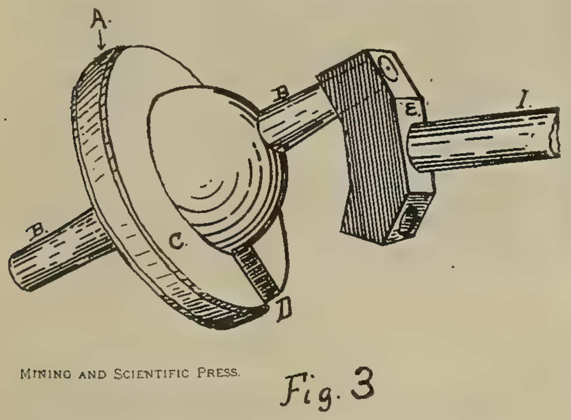
MINING AND SCIENTIFIC PRESS



MINING AND SCIENTIFIC PRESS. *Fig. 3*

To better explain the workings of this engine, it will be necessary to refer to the accompanying illustrations. In Fig. 1 the engine is shown complete, ready for the admission of steam. A is the steam cylinder, containing a gyrating disc which will be referred to later on. B, C are steam and exhaust pipes, respectively. D, D are bonnets bolted to the cylinder, and in which the crank pins gyrate and the crank rotates, transmitting its motion to the engine shaft E. F is the driving pulley, G is the fly wheel, H, H are the journal boxes and I is the base on which the engine rests.

The novel feature in this engine is the gyrating piston. It is a metal disc whose diameter corresponds to the diameter of the cylinder and determines the size of the engine.

The disc is made with a sphere in its center, as shown in the illustration at C (Fig. 2), the sphere and disc being in one piece. The outer edge of the disc is recessed to receive a spring packing ring A, whose duty is identical with the spring ring of any reciprocating piston engine. At D the disc is bored from its periphery to the face of the sphere to receive the brass bushing D, turned to a working fit and slotted to receive the diaphragm mentioned later on. B is the crank pin and is driven tightly into the disc and sphere.

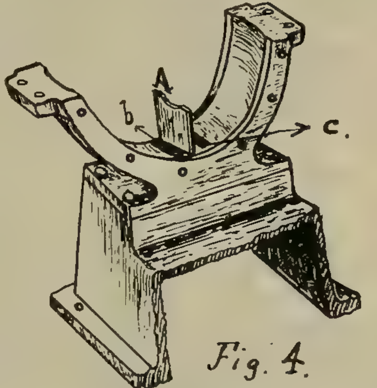


Fig. 4.

MINING AND SCIENTIFIC PRESS.

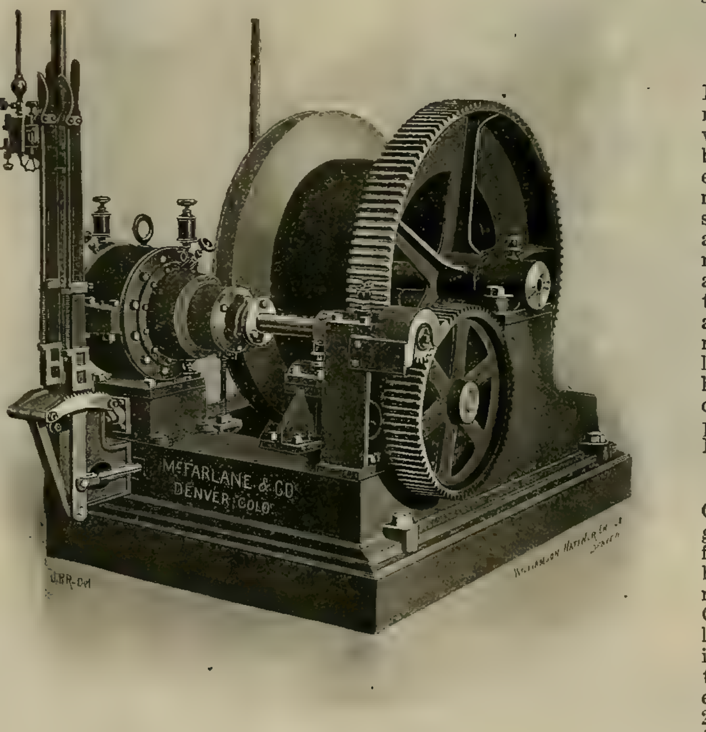

Fig. 6.

Fig. 3 shows the disc C and the crank E in position, but with the cylinder entirely removed. The crank is keyed to the main shaft I and is bored to receive the crank pin B.

Fig. 4 shows the lower half of the steam cylinder with the diaphragm A in place. This diaphragm, in conjunction with the disc, divides the cylinder into two parts, one part containing live steam and the other the exhaust steam, besides preventing the disc from rotating around its axis. D and C are steam and exhaust ports, respectively.

Fig. 5 shows the cylinder heads A, A, diaphram b, disc e and crank f in place, the top and bottom parts of the cylinder and bonnets being removed.

The cylinder heads are cone-shaped on their inner face and so constructed that the disc lies against one head on one side at c and against the other on its opposite side at d, making two lines of contact between the disc and cylinder heads diametrically opposite each other and on opposite sides of the disc. The cylinder heads are each provided with a socket which acts as bearings for the sphere.

The motion of the crank pin may be illustrated by the movement of the forearm in describing a circle with the hand, while keeping the wrist rigid and the elbow at rest and with index finger in the crank pin journal. Thus, it will be seen that while the crank pin gyrates, it does not rotate on its axis, but transmits a rotary motion to the shaft through the crank.

The nominal speed of this engine is 1000 revolutions per minute. Its weight per given horse power is considerably less than that of the reciprocating engine. The manufacturers say that it has no dead center and is instantly reversible, which would make it an ideal engine for a hoister. There are no valves to set or get out of order. In a hoister the steam and reverse levers are embodied in one. There is no claim of originality, except in the new application of an old principle. McFarlane & Co., of Denver, Colo., who make it, say that it will lift, when applied to a hoister, a greater load at equal speed than any hoister on the market of equal weight.

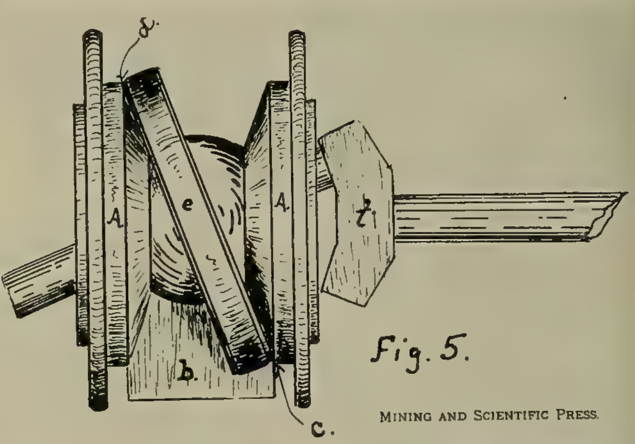

Fig. 5.

MINING AND SCIENTIFIC PRESS.

Figure 6 illustrates the engine as applied to a hoister.

◆

As Judged in New York.

The MINING AND SCIENTIFIC PRESS of San Francisco, Cal., recently closed its eightieth volume. This is one of the very best, if not the best, of our exchanges. It seems almost a mystery how a paper with such expensive and various accomplishments in the line of news gathering, illustrations, and discursions into the scientific field, can be maintained at the point of its establishment. Evidently it is published in a land of plenty, and has a good sized and liberal constituency to back it.—Copper, Zinc and Lead Review, New York City.

◆

THE Bay Counties Power Co. is a California corporation generating electric power from the Yuba river, and building parallel lines from its main generating station to Oakland, 140 miles, via Woodland to Benicia, there crossing the straits. Two steel towers are being built, one on either shore, the tallest to be 230 feet. Each line is projected to carry 9000 H. P. The company has three generating plants and has about 450 miles line—one to Sacramento 60 miles long, another to Oroville, 30 miles long, and another 30-mile cable to Marysville; E. J. de Sabla Jr. is president and C. A. Grow secretary.

MINING SUMMARY.

ALASKA.

A company has been formed at Dawson to buy machinery at Nome; to send a representative to Nome and wherever he finds any stranded miners to pay their fare back home for their machinery. Late arrivals from Nome have reported that thousands of tons of valuable machinery are lying on the beach covered by the high tides and being covered by the drifting sands. This machinery was taken to Nome to work the beach and cost thousands of dollars. Those who took this machinery to Nome did not doubt that the gold was there, and their only doubt was as to whether the machinery would have large enough capacity. Thousands of feet of hydraulic hose are lying on the beach at Nome. This hose was manufactured to run out into the surf, and, by attaching an engine, to suck the sand inward. Nearly every arrival had some scheme to get the gold that was in keeping with their imaginary powers. The steam boilers that are on the Nome beach and other machinery of that description will find a ready market along the Yukon, and the thousands of feet of hose will be used as pipe line to get water to the Anvil and other creek claims.

F. C. Hammond has contracts with the Westinghouse Electric Co. for an electric power plant to transmit power from Sheep creek under the channel to the Ready Bullion and Mexican on the other shore. The Alaska Water Power Co. is credited with having a contract from the Alaska-Treadwell Co. for the use of 850 H. P. throughout the year as a minimum amount, water to be taken from the creek at 700 feet above tide water; the complete installation is to cost $40,000. It is calculated that at the contract price the Treadwell group will annually save $20,000.

The Kingston mine is being operated by Rolling, Rogers & Star.

MARICOPA COUNTY.

At Phœnix the Eclipse Copper M. Co. was incorporated on the 15th: capitalization, $1,000,000; temporary directors—W. R. McCormick, G. E. Dunbar, Kalamazoo, Mich.; W. J. McKay, Chicago, Ill.; T. B. Mills, E. V. Long, Las Vegas, N. M.; principal office at Phœnix.

MOJAVE COUNTY.

A shipment of ten tons of ore from the Home Pastime mine at Mineral Park to Kingman gave returns of 500 ounces silver to the ton. The mine belongs to Mrs. M. E. Prisk of Chloride.

Kingman Miner: The Sheeptrail mill has made a clean-up of a run of 20½ days of the 20-stamp mill, working half time, resulting in a bar of gold, $30,000. The mill has a daily capacity of sixty tons; the teams employed can haul but thirty tons daily.——Metcalfe & Tyrrell have opened a body of lead ore in the Great Eastern mine, in the Wallapai mountains.——The Oro Plata mine shows ore in the face of the north drift that runs 90 ounces silver and 2½ ounces gold to the ton.——E. F. Thompson has leased the Lone Star mine for a year. The Star has been a producer of silver-gold ore.

PIMA COUNTY.

S. C. Neilsen has leased the Altar group of thirteen mines with a bond in the interest of the Ray Copper Co. A thirty-ton water-jacket smelter is in charge of G. Campbell. Ninety men are employed in the mine and smelter.

Tucson reports a 3-foot vein of gold ore discovered in Old Baldy, 30 miles south of there.

From Helvetia is reported a body of sulphide copper ore. Manager Seager says it is 40 feet in width. The Helvetia Co. projects a railroad to connect with the S. P. at Vails station, 18 miles away.

SANTA CRUZ COUNTY.

Near Patagonia sixty men are at work in the old Mowry mine, superintended by E. E. Wilson.

Near Washington the Duquesne G. M. Co. has a shaft down 640 feet. Paying ore is developed, but pending selection of process of treatment nothing is being done.

The Pride of the West M. Co., operating in Washington, have a magnetic process of treating their ores. Forty tons of ore are run through the mill daily, eleven tons of concentrates shipped to Silver City, the lead to El Paso. A 60-ton smelter is building. Emersen Gee is Supt. Washington is about 30 miles from Patagonia and has an altitude of 6000 feet.

CALIFORNIA.

The executive committee of the California Miners' Association met in San Francisco on the 13th to discuss the injunction suit of the Anti-Debris Association of Sutter County against the Polar Star hydraulic mine in Placer county. W. Nichols, the owner of the Polar Star mine, said his permit was in due form and he wanted the executive committee to employ counsel to assist his attorneys in fighting the Sutter County Association's injunction. A committee was appointed to inquire into the facts of the case and engage counsel to assist Mr. Nichols if it thought proper.

A resolution was ordered sent to the Secretary of the Interior calling his attention to the importance of systematic measurements of the flow of the Sacramento, Stanislaus, Tuolumne, San Joaquin, Kings, Salinas, Yuba and Bear rivers, Cache and Stony creeks and other streams of central and northern California, and requesting, in directing the work of the Geological Survey, that he have consideration given to the needs of the localities named.

A donation of $150 was ordered given to the Native Sons' celebration. It was decided to hold the annual convention of the association in San Francisco Nov. 19th.

AMADOR COUNTY.

The Wataga G. M. Co. has organized to develop an ancient river channel near Volcano.

The East shaft of the Kennedy mine has reached a depth of 1500 feet. An average of 85 feet a month is made.

The Modoc mine, near Volcano, is to be tunneled. T. Schenck has charge of the work.

In the Lincoln at Sutter Creek crosscutting on the 1200-foot level goes on.

At the Defender mine, near West Point, C. H. Norton is working the tailings over a canvas plant.

BUTTE COUNTY.

J. R. Watson, Jr., of Oakland, succeeds Supt. Archibald at the Golden Trout mine, Enterprise. It is the stated intention to put up a 60-stamp mill, erect hoisting and chlorination works.

About thirty-five men are employed on the ditch and tunnel, being constructed to carry water from Cherokee to the Banner mine. D. W. Smith has charge.

CALAVERAS COUNTY.

The Mutual M. & M. Co., Boston, which has a bond on the Waters mine, near Copperopolis, has made another payment of $1000.

J. E. Burton has sold his interest in the Green Mountain mine to Tarbell & Amendt for $10,000.

In Angels at the Oriole mine a strike is reported on the north drift of the 400. Sinking is in progress at the Angels mine. The Mutual M. Co. has made a third payment of $1000. The mine is now worked down to the water. The work of unwatering the Tulloch mine is finished.

Including the workmen upon the dam the Melones Co. at Robinsons have about 125 men on the pay roll.

Prospect: Timbering is resumed at the Ford mine.——The Union mine at Copperopolis has men developing.——Shafts are being sunk on the south extension of the Royal at Hodson.——The 40-stamp mill of the Royal Company at Hodson is in operation.——The McSorley gravel mine at Camanche has resumed.——About 100 men are employed at the copper mines at Campo Seco.——Womble Bros. have leased the mill belonging to the Empire Company and will work ore from the Mountain King mine, near Hodson.——On Hog hill, near Telegraph City, the old Napoleon copper claim is being opened up by the Williams Bros.——At the Lloyd mine, at Central Hill, men are sinking the 200-foot shaft to strike the ledge.

DEL NORTE COUNTY.

B. A. Cardwell, Supt. of Monkey Creek placer mines, is piping preliminary to running when rain sets in.

Fifty men are at work on the Big Flat mining ditch.

EL DORADO COUNTY.

The Tin Cup mine is sold by W. H. Martin to Hayward & Lane for $15,000.

Crocker & Robert, operating the Lilly Emma copper mine near Pilot Hill, have sent 180 pounds of ore to the State Mining Bureau.

FRESNO COUNTY.

Several oil companies have contracted with the Union Oil Co. whereby that company by running a special line into the territory will take all the oil produced at going figures up to 1000 barrels a day.

The Copper King manager on the 19th ult. cabled the London office: July 4—Cablegram from mine manager: "Have opened up a fine body of ore in level No. 3; am driving level No. 4 and level No. 5 in order to prove whether it is persistent in depth; will duly advise you by cable as regards developments." July 12—Cablegram from the general manager, dated July 11: "Ore body cut in level No. 3 is opening up splendidly, and every indication of cutting it in level No. 4 and level No. 5; will cable assays this week. Have cut the high-grade ore body in level No. 4 and driven on it 21 feet. The average width is 12 feet; the average value is over 9½% copper."

INYO COUNTY.

At Castle Peak mine Supt. Kermeen has the assay office finished; the damage to the cyanide works by the fire has been repaired; about fifty men are employed.

The Independent states that the Brown Monster mine, southeast of Independence, has been bonded to Eastern men.

KERN COUNTY.

The electric road between Kern and Bakersfield will be in operation Sept. 20th.

The Grace Oil Co. has a gusher in well No. 3. After penetrating 8 feet of clay over the fifth oil sand, oil flowed.

The Sacramento Oil Co., in Kern field, has four finished wells. The only one on the pump is yielding 100 barrels.

In the case of Kern county vs. Recorder C. A. Lee the Supreme Court of California has rendered a decision sustaining the finding of the Superior Court, in favor of the county and against the recorder. This is to recover money retained by Lee as fees for recording mining location notices. The recorder claimed that under the law and the Supreme Court's decisions he was not compelled to record such notices, and that therefore the fees belonged to him and not to the county. The Supreme Court rules that, while its decisions were in accordance with the law at the time they were given, the statutes have since been changed and the decisions are not applicable. Accordingly the recorder must pay such fees over as county money.

Mining Review: At the Red Dog mill, Johannesburg, a run on thirty-five tons of ore from the Santa Ana mine, in the Stringer district, netted the leasers something like $1300—the result of a month's work by two men.

LAKE COUNTY.

The recent sale of the Sulphur Banks quicksilver mine has led to the formation of the Empire Con. Q. M. Co., under the laws of New Jersey, to control that and three other properties, two of them being in Colusa county; capital stock, $5,000,000. The properties taken into the company are: Sulphur Banks Q. M. Co., Lake county; Abbott Q. M. Co., Lake county; Empire Q. M. Co., Colusa county; Central Q. M. Co., Colusa county.

LOS ANGELES COUNTY.

The Central Oil Co. of the Whittier field reports a monthly production of 11,500 barrels oil.

MADERA COUNTY.

(Special Correspondence). — The new stamp mill of the Magnet M. & M. Co. is completed and will start Sept. 1st.

A contract has been let to drift north and south from the main shaft of the Standard mine at the 400 level.

Development work and extraction of ore is going on at the Mud Springs.

Legal complications have temporarily closed down the Lily.

Work is being pushed both in the mine and mill at the Waterloo.

The old Last Chance mill is a thing of the past, having been completely destroyed in the late forest fire.

Gold, Aug. 14.

MARIPOSA COUNTY.

At Coulterville the Merced G. M. Co. employs about fifty men on the Mary Harrison mine. At the Murphy mine fourteen men are employed, and at White Gulch, 5 miles south of Coulterville, about thirty; at Kinsley, 16 miles east of Coulterville, about forty; at Pine Tree, sixteen; at Josephine, fifteen; at Princeton, thirty; at Mariposa, forty. Shovelers, car men and blacksmith helpers are paid $2.50 per diem, miners $3, machine men $3.25, blacksmiths $3.50 and $4, foremen $3 and engineers $3.50.

NEVADA COUNTY.

The Tilley G. & S. M. Co. has incorporated at $31,250; principal place of business, Nevada City.

At the Franklin mine, Willow Valley, the pipe line being constructed will furnish a pressure of 462 feet. The old shaft will be pumped out and sinking resumed.

The Merrifield shaft is being sunk to the 900 level. At the 700 a drift has been started.

The shaft of the Federal Loan has been pumped clear to the depth of 450 feet. Five stamps of the mill have been started.

At the Providence mine development work goes on under the direction of P. Tautphaus.

At the Tulle Bell mine, on Cincinnati Hill, the new hoisting works are completed, and the new two-compartment shaft is being sunk.

The new 20-stamp mill at the Coe mine has started and will be run by electricity. O. A. Turner is Supt.

Haskins & Eldridge will open the Franklin mine in Willow valley. The pipe line will give a pressure of 462 feet. At the Texas Supt. Davis is sinking to a depth of 500 feet. The Merrifield shaft is going down to the 900-foot level. On the 700 level a drift has been started. The Federal Loan leasers are operating five stamps of the mill. The shaft has been unwatered to 450 feet. Supt. Harmon of the Gaston Ridge mine will put in ten new stamps, thirty stamps in all.

PLACER COUNTY.

The South Yuba Co. is building a new reservoir at Soda Springs station; height of dam, 27 feet; storage capacity, 150,000 inches of water, which is equal to a flow of 1000 inches per day for 150 days; thirty-eight shovelers and twenty-three men with teams are employed.

The Hidden Treasure mine employs 170 men. The station in the white channel has been moved to a point 1000 feet up the channel. The blue or lower channel has been opened up for a distance of 600 feet. The channel is 250 feet in width. With the present machinery the company is able to daily take out 250 cars of blue gravel.

On the Middle Fork of the American river the Cash Rock Co. intends to put in machinery and drill through the gravel beds.

SAN BENITO COUNTY.

C. J. Tallon projects oil operations near Hollister.

SAN BERNARDINO COUNTY.

Mining Review: The recently located placers between Barstow and Copper City report considerable gold being taken out by the dry washers. Hundreds of claims have been staked out. Water at a depth of 70 feet is selling at 75 cents a barrel.

SANTA BARBARA COUNTY.

The Santa Barbara & Naples O. & L. Co. is putting down a test well at Naples, has struck oil at a depth of 620 feet, producing a barrel a day.

SISKIYOU COUNTY.

The plant of the Portland Gold Extracting Co., that has been operating at Rollin, was sold at auction last week to cover bills of attachments amounting to about $1700.

STANISLAUS COUNTY.

Modesto will try oil for fuel at its central lighting and pumping station, the oil to cost delivered at the station $1.42 per barrel of forty-two gallons. The parties selling the oil claim that in making steam, three barrels of oil are equal to one ton of good coal; that is, where a good quality of coal exceeds $4.26 per ton, oil is the cheaper fuel.

TRINITY COUNTY.

The La Grange Hydraulic G. M. Co.'s property comprises about 3200 acres. The canal from Rush creek, 14½ miles, has five tunnels, aggregating 2118 feet in length, grade ¾ to 1 inch to the rod, timbered almost their entire length; about seven-eighths of the ditch is in rock; they are 7 feet on top, 4½ at the bottom, 4 deep, grade 14½ feet to the mile, and carry 3000 miner's inches, or 60 cubic feet, per second. The main canal is 14½ miles in length, capacity 4000 inches; upper Loveridge ditch, 4 miles, capacity 1500 inches; lower Loveridge ditch, 1¾ miles, capacity 600 inches, with five of minor importance, making the aggregate about 23 miles, capacity 7000 inches. The waters are taken from Rush, West Weaver and other creeks. To increase the volume of water, Rush creek and Stuart's Fork are connected by tunnel through the mountain, 9000 feet in length, 5x7 feet diameter, passing under the comb of the mountain at a depth of over 3000 feet. At the top of Table mountain, a reservoir is supplied by the canal system, from which pipes radiate to the various giants, 15, 18 and 22 inches in diameter, and under various heads. The mine has a top sluice 108 feet long, 6 feet wide, 3 feet deep, grade of 8 inches to 12 feet, paved with block riffles 16x16½, 11x13, 13x13, followed by ground sluices 100 feet long; below are forty-three boxes, 12 feet each, paved with block and stone riffles. At the end of the main sluice is a chute with right and left undercurrent, one 18x38, the other 24x46, paved with block riffles; grade of upper sluice, 8 to 12 inches to the box of 12 feet.

TUOLUMNE COUNTY.

Boston reports that all but about 3000 shares out of the 130,000 of old Santa Ysabel G. M. Co.'s stock has now been turned in and paid the $1 per share called for. A new superintendent has been practically decided upon. The new stock certificates will be ready to issue Sept. 1.

Near Jamestown the Kanaka mines' compressor is to be repaired. The Longfellow mine has its new pumping plant in operation. The Yosemite G. M. Co. is washing gravel. The Little Wonder is shut down.

The Eagle-Shawmut M. Co. will lay 9000 feet of iron pipe from the Blue Gulch reservoir to the mine; at the reservoir the pipe line will be 30 inches, decreasing to 20 inches. Supt. Spatz of the Poison Oak mine will put in a hoist and 5-stamp mill.

The Hudson mine, Bald mountain, is to be unwatered.

The Confidence M. Co. has laid off about fifty men, pending completion of the work on the incline shaft, to be retimbered from the surface to the 350 level, during which time the mill will be closed down. At the Dreisam mine the shaft is down 360 feet.

VENTURA COUNTY.

The Ocean View O. & M. Co. have struck oil at 200 feet and again at 500 feet on Rincon creek.

The oil and mineral rights in Senator Bard's 6000-acre Ojai ranch have been transferred to Los Angeles men.

YUBA COUNTY.

The Golden Trout mine, near Strawberry Valley, talks of a new 40-stamp mill. At New York Flat a mill is to be erected on the Miller property. A. F. Roberts of New York Flat also talks of a mill.

COLORADO.

BOULDER COUNTY.

At Eldora the Mogul tunnel indicates rich ore in the Village Belle drift, 18 inches wide, of roscolite quartz and sylvanite.

Supt. Denison of the Gold Nugget has driven a tunnel 200 feet, from a point 400 feet below the old workings, and has 2 feet of smelting ore. The new mill will have a capacity of sixty tons per day and is expected to be in operation October 15.

G. Leal is running the mill at Sunnyside on ore from the Pennsylvania mine which averages $400 per week besides the expenses.

The B. & M. at Ward has ore in all the levels, enough in sight to keep up an output of a carload of twenty tons per day.

The Utica at Ward is repairing the workings and employing a small force. When the repairs are completed the former production will be resumed.

CHAFFEE COUNTY.

The Madonna mine at Monarch is in charge of M. McGovern of Leadville, who is taking out ore which yields 16 ounces silver, 52% lead, and 2 ounces gold.

CLEAR CREEK COUNTY.

The Yankee Hill Con. M. Co. will develop the Alice mine on Yankee hill to the depth of 500 feet. The shaft will be 4½x9 feet in the clear, two compartments.

Idado Springs concentrating mills are treating considerable ore from Gilpin county.

The Yankee Hill Con. M. Co. will develop its Alice mine on Fall river and sink 500 feet. The shaft will be 4½x9 feet in the clear.

Georgetown Courier: The Alice M. Co. has granted an option for the sale of the property to F. Carpenter; consideration, $500,000.——The Lone Tree at Freeland is developing smelting ore worth $40 a ton, in addition to 12 inches milling ore.——To the electrical machinery to be installed by the Lamartine mine the power will be furnished by the United Light & Power Co. of Georgetown, whose new plant is nearly completed. The line is already constructed between the power company's plant and the Lamartine mine. The Lamartine will be the first mine in the county to be thus equipped.——The Brazil mine at Freeland is being worked by Okerstrom & Co. They have a streak of smelting ore 15 inches in width that carries gold and silver values averaging about $100 a ton.——The Bullion King M. & M. Co. has been organized with $1,000,000 to purchase the Bullion King; it adjoins the Stanley mine, south side of Clear creek. A hoisting plant has been installed.

The Kokomo mine is being operated by Burton & Co. of Idaho Springs. There are twenty men employed. The ore is hauled by wagon to Missouri Flats, loaded into the Gilpin tramway cars and hauled to Blackhawk, reloaded on cars and hauled to Dumont, where the operators have a mill.

Electrical machinery will be put in at the Lamartine mine; the U. L. & P. Co. of Georgetown will furnish the power. The Lamartine mine will be the first mine in Clear Creek county to be thus equipped.

The completion of a new dam has enabled the Mixell mill to resume operations.

EL PASO COUNTY.

When the smelter now being erected at Colorado City by the Standard Reduction Co. is finished the ore-treating capacity of Colorado City is expected to be in the neighborhood of 30,000 tons per month.

The new Portland chlorination mill, to be built at Colorado City at a cost of $300,000, will be constructed entirely of steel. It is expected that the mill will be completed and running by April, 1901. The mill will be automatic from the time the ore is received from the tracks of the Cripple Creek Short Line, which will skirt the mill on the north side, until the treatment is completed on the other side of the mill.

FREMONT COUNTY.

North of Florence the Dorcas M. & M. Co. is building a 100-ton chlorination mill arranged to work on the gravity principle. Pulleys are used except in the largest buildings, the ore sliding from one floor to another, and dropping the tailings down the hill. An engine pumps the water from a reservoir in the bed of the Arkansas; capacity 50,000 gallons. The north side of the mill will be 150 feet long, besides the dust and bag rooms.

GILPIN COUNTY.

The new mill at Blackhawk has forty stamps running on ores from the Gregory and Ridgewood properties.

In the 600 east level of the Ridgewood mine there is now 3 feet of ore. An assay on the smelting ore gave 92 ounces gold and 14 ounces silver.

GUNNISON COUNTY.

At Crested Butte the local mine during the month of July produced: coal, 26,072 tons; coke, 6585 tons.

Wm. O'Brien has taken charge of the Good Hope mine at Vulcan.

HINSDALE COUNTY.

Times: Near Lake City Pierce & Kilvert are building a dam on Henson creek for power to run the drills in the 5200-foot tunnel under Schafer basin.——The Mineral Flower M. Co., capital stock $300,000, is incorporated to operate in Hinsdale county.

LAKE COUNTY.

Leadville has fifty producing mines, which are shipping to the smelters 2500 tons a day of ore, the gross value of which is $50,000, says the Herald. There are fifteen shafts being sunk in various portions of the district, which will cost not less than a half-million of dollars. Three large smelters are in operation, with a capacity of over 1500 tons daily, but the camp supplies large quantities of raw material to the majority of the furnaces of the West.

Leadville Miner: Negotiations for the possession of the Resurrection G. M. Co., Evans, are at an end, E. Smith having notified A. Gorham that the property was not for sale.——The Penrose shaft of the Leadville Home M. Co. has been sunk 40 feet. General Manager Bohn and Supt. Nimon have machinery to handle the expected heavier flow of water.——At the Bon Air shaft large bodies of good grade iron ore are exposed and taken directly from the bins to the cars.——The ore hauling business in Leadville since the advent of mineral belt lines to the mines is on the decline. Owners of teams are going into outside camps with their stock.

LARIMER COUNTY.

The B. & C. C. M. Co. is working three shifts on the Empire mine in Howe's gulch, 7 miles west of Fort Collins, and has its shaft down 200 feet. The vein is 7 feet wide.

At Manhattan, J. H. Whedbee, manager Missouri M. & M. Co., is doing development work on the Emily mine.

PITKIN COUNTY.

The properties of the Percy Con. M. Co. and the Castle Creek T. & P. Co. brought $100,000 at sheriff's sale last week. They were bought by G. S. Newman.

The Argentum–Juniata M. Co. is shipping ore from the seventh level which goes 800 ounces of silver to the ton.

Aspen Tribune: The pumps on the Argentum-Juniata, which have been submerged at the seventh level, will be pulled and put on the Mollie Gibson mine on the thirteenth level, and a sinker placed on the A. J. mine. The water will then be handled by the Mollie.

SAN JUAN COUNTY.

Near Silverton, a 3200-foot tramway line will be put in, connecting the American tunnel in Bonita gulch with the Gold King mill.

SAN MIGUEL COUNTY.

In Telluride district, the Palmyra property, owned by the Four Metals Co., is weekly shipping six cars of ore.

The Keystone placer cleaned up $600, locally stated to represent the sluicing of 1200 yards, worth 50 cents a yard. A shaft was sunk to bedrock and the gravel raised to the sluice level by a hydraulic pump.

At the Butterfly mill, Ophir Loop, a recent cleanup gave 125½ ounces, valued at $1900.

The Bessie shows increase in the ore valuation of the Baldy and Little Sioux veins. The last cleanup gave 65 pounds.

In the La Sal country, the uranium plant at Cashin is to be rebuilt.

Work is to be resumed on the Silver Pick property on Mt. Wilson. Supt. Nason will also push operations on the Tam O'Shanter.

Near Ophir the Alta mine is averaging six cars a week.

Two cars of narrow-gauge rail are at the Deadwood; the timbering is finished and the tunnel is being widened.

Roscoelite, a green vanadium mineral, is announced by F. L. Ransome as occurring as an impregnation in the lower bed of the La Plata sandstone at Placerville, associated with carnotite. The Georgetown Courier says the mineral was previously found in Magnolia district, Boulder county, where it occurs as a thin earthy incrustation on calaverite.

The cyanide plant below the Suffolk mine is sold to E. W. Bennett, who will increase its capacity. The assay averages $6 per ton.

The Journal says for the first week in August the ore and concentrates shipped from the Telluride station aggregated forty-nine cars. Ophir Loop is reported shipping about twenty-five cars a week.

Manager Sayre of the Butterfly-Terrible has shipped another gold brick to Denver, weighing 125½ ounces, value $1900. The property of the Butterfly-Terrible is shipping fifty tons a day.

TELLER COUNTY.

(Special Correspondence).—The Granite mine, on Battle mountain, belongs to the Smith-Moffat interests and has been considerable of a shipper from the sixth and seventh levels. Within the past few months the shaft has been sunk to 1000 feet depth, where a station 10x50 feet and 18 feet high has been cut. From the shaft at this depth it will require a 250-foot crosscut to reach the ore body. The large electric hoist put in here last year has been discarded and a first-motion steam hoist will replace it. The shaft house is also being enlarged and the management hopes to be shipping from the tenth level within sixty days. C. H. Cannam is in charge of the work.

The new equipment at the Ajax, including new boilers and hoist, is operating satisfactorily. The intention is to put in automatic stokers here. The Ajax shaft, now at 600 feet, will be sunk to 1000 feet depth.

The Mary McKinney's shipments now run about 80 tons per day, the ore coming from all the levels from 50 feet down to the 400 level. One-half the ore runs an average of one and one-quarter ounces gold and the other half will average as high as three ounces. Most of this ore goes to the smelters, whose buyers are in the market for all ore they can get that runs as high as one ounce gold to the ton. While mine operators cannot be induced to talk freely as to present smelter rates, it is evident they are getting a much more favorable rate than the smelters were willing to make three or four months ago. Relations of the mines with the cyanide and chlorination mills, as to rates, do not seem to be entirely satisfactory, though the increasing demands for ore on the part of the mills and smelters are certain to bring about an adjustment. It is believed the district is in position to furnish a tremendous tonnage of milling ore and this will be done as soon as rates shall be adjusted on a mutually satisfactory basis.

The Nugget shaft is being operated by the Nugget Co. They appear to have the extension of the well-known Jack Pot vein, from which thirty tons of three and one-half-ounce ore are being shipped per week. The Smith lease on part of the Nugget grounds is shipping forty to fifty tons per day of ore, said to average $70 per ton, from a vein running parallel to the Jack Pot.

The Jack Pot group belongs to the Woods combination, who have a three-years lease on the Morning Glory shaft of the Work, which adjoins the Jack Pot. The production of the latter will be hoisted through the Morning Glory shaft.

At the Jennie Sample, on Raven, an air compressor is being put in. A station is being cut at 500 feet depth. Considerable ore has been shipped from this mine which averaged five ounces gold.

The Elkton is spending a large sum on improvements. The shaft is being made three-compartment from the surface to the fourth level. In sinking from the 400 to the 800 level the three-compartment size was made and present work is to make the upper section of the shaft conform in size to the lower section. At the 800-foot station a Prescott 800-foot, straight-lift pump is being put in place. Its capacity will be 1000 gallons per minute. Material for a 55-foot steel gallows-frame has been ordered, which will soon replace the wood frame now in use. Its structure will be such as to make the ore landing 25-feet above the collar of the shaft. An ore house is in course of erection, which will afford facilities for handling 150 to 200 tons per day. A first-motion hoist, 20x48, double reel, capable of hoisting from 2000 feet depth, is being put in. The Elkton is shipping now from 1000 to 1200 tons of ore per month, which averages $100 per ton, all of which goes to the smelter and comes from the fifth and sixth levels. As soon as the new pump is ready for work the ore body will be tapped at the seventh and eighth levels.

The works of the Eagle Ore Sampling Co. started up on the 9th inst.

Victor, Aug. 10.

During July the Elkton mine is credited with having shipped 1000 tons of ore yielding $125,000. The station in the eighth level at a depth of 800 feet is cut and a pump in place. Work will begin on the crosscut from the Elkton shaft to the Elkton vein, 40 feet distant. When the dyke carrying this vein is broken into there will be a flow of water, which it is designed to handle with the 1000-gallon-a-minute pump at the eighth level.

The Gold Belt M. & I. Co. has sold the St. Patrick G. M. Syndicate the St. Patrick claim, in the limits of the city of Victor, for $300,000.

The shaft on the Coriolanus mine at Victor is down 250 feet. The mine is shipping from its workings on the north end of the property ore that runs two ounces to the ton.

The report of the Portland mine for the calendar year 1899 shows receipts for the year from the mine $1,960,487; from rents, $11,891, a total of $1,972,378; payments on ore mined and mine equipment accounts were $835,235; general and other expenses, $266,236; total, $1,101,471; net profit, $870,907. During the year the mine produced 38,548 tons, containing 97,428 ounces gold and 6701 ounces silver; gross value, $1,951,219, or $50.62 per ton. Treatment charges were $311,908, or $8.09 per ton; freight, $103,026, $2.67 per ton: total, $414,934, or $10.76 per ton; net value, $1,536,285, $39.86 per ton. During the first six months average number gallons water pumped 50,000,000 per month, and for the year 37,000,000 gallons per month, at a monthly cost of $6500. Amount of development work done during the past year, 21,062 feet.

The Anaconda Co. will sink the winze in the tunnel level 500 feet. The tunnel is in 4500 feet and has 2 miles of laterals running off from it.

The Isabella will again ship ore; it has been closed down since last February.

IDAHO.

BLAINE COUNTY.

Hailey Times: Owners of the Jumbo and Golden Star groups on the Gold Belt, and of the Liberal and Maggie May groups in Little Smoky, have men at work and intend to build a mill at the Golden Star and another at the Jumbo.

CUSTER COUNTY.

Smith & Roberts have finished cleaning up, taking out $9000. Had the water lasted for another month the output would have been nearly double.

ELMORE COUNTY.

The Homestake mine at Neal, owned by C. Balbach, reports a strike in the Blacksmith tunnel of valuable ore.

IDAHO COUNTY.

Warren reports a strike in the Little Giant mine, owned and worked by G. Riebold. The vein is peculiar from the fact that it offsets from its incline by dropping down every 30 feet for a distance of a few feet, and has worked on that theory from the time the first offset was encountered. It is now down 300 feet. J. J. Bennett is Supt.

F. E. Johnesse, Supt. Idaho E. & C. Co., has an average of 7% copper in the Blue Jacket, located between the Little Salmon and Snake rivers.

The road into Buffalo Hump has been completed for wagons between the terminus of the Northern Pacific at Stites and Callender, the syndicate's new townsite at the Hump, by way of Elk City. The distance from Stites to the Big Buffalo mine is 70 miles. The Big Buffalo expects to have all its machinery in operation by October 1st.

ONEIDA COUNTY.

Thirty-five miles below American falls, near Keach island, the dredge of H. S. Abbott & Co. is handling 700 cubic yards per day. It is a bucket dredge; cost $16,000. Six miles up the river from the Abbott dredge the Yale M. Co. is putting in a dredge to cost $40,000 and to have a daily capacity of 800 cubic yards, under the direction of Geo. Burroughs.

SHOSHONE COUNTY.

T. H. Simmonds has been engaged as foreman at the Bunker Hill & Sullivan mine at Wardner, succeeding J. W. Roundy.

Kellogg has a new concentrator, 24x40 feet, for working the tailings of the Empire State mill.

Wesley Everett, Supt. Leslie M. Co., has an ore shoot 7 feet wide carrying silver, gold and copper. The larger part of the value is in silver, in which assays average twelve ounces.

WASHINGTON COUNTY.

At Ruthburg, on the Lookout claim, owned by Alers and Mossman (the old Belmont property), development is going on. Supt. Raymond is on the ledge in the Abbie. A contract for 150 feet of tunnel has been let on the What Cheer property, under the superintendence of H. M. St. Cyr.

Ford Bros. of Colorado have bought the Placer Basin group of E. M. Barton.

The Gold Coin M. Co., H. Salzer Supt., has twenty men north of Weiser for the installation of a cyanide plant near Black lake.

MONTANA.

CASCADE COUNTY.

The Broadwater mine near Neihart is shipping ore regularly. Besides the force employed at wages, there are fifty men operating leases in various parts of the mine. The mine is blocked out into sections of 50 feet each, running up from one level to another, and the leasing is by sections. Chutes of ore assaying from 400 to 1000 ounces of silver per ton have been uncovered.

DEER LODGE COUNTY.

Forest fires are burning timber belonging to the Big Blackfoot M. Co. near Sunset. The company sent 200 men to fight it.

FLATHEAD COUNTY.

Near Libby Manager Beager of the American-Kootenai M. Co. expects to have a new stamp mill in operation Oct. 1st.

The last two cars of concentrates from the Snowshoe mine have been shipped to Great Falls, the mill is shut down, and there are no concentrates at the mine. Nobody is at the mine but the watchman.

At Sylvanite the Keystone Con. M. Co. has acquired a controlling interest in the Yankee Girl and Julinetta. This gives the company nine claims in a compact body. It has two stamp mills at Sylvanite, one for the Keystone and one on the Gold Flint, thirty stamps in all. These mills will be torn down and a new one of 100 stamps will be built on the Yakt river. J. A. Finch is general manager.

JEFFERSON COUNTY.

Basin hears that Jefferson county is to have a smelting plant to treat the zinc ores of the State by the Sadtler process, near Boulder.

LEWIS AND CLARKE COUNTY.

From Marysville the Helena Independent is told that the report of the shut down of the Drum Lummon mine was exaggerated. It was the mill that shut down and a few miners who were getting out ore for the mill. The prospect work goes on more actively than before the mill shut down, and the force employed in doing this work has been increased.

The North Star mine is being developed through the 400-foot level of the Drum Lummon, and five teams are taking this ore to the Bald Mountain mill.

J. H. Longmaid of the Belmont mine at Marysville says that work has been commenced sinking the shaft from the mill tunnel level. The mill at the Belmont is running; 150 men are employed in the mine and mill.

MADISON COUNTY.

W. K. Edwards is Supt. McVey M. & M. Co., at Sand creek, near Pony, the high-grade ores netting $40 on the market, the low-grade being handled by a stamp mill.

Dr. Fletcher has completed three cyanide tanks at his plant on Mill creek.

R. W. Noble will retimber the Noble shaft at Nobleville.

At Red Bluff the Red Chief mine will put up a thirty-ton concentrator.

SILVER BOW COUNTY.

A chattel mortgage for $21,000 from O. B. Peck to F. Farrel of Ansonia, Conn., is filed on a 10-stamp ore battery and machinery on the Centennial mill site. Mr. Peck is an inventor and the mill referred to proposed to treat low-grade ores.

Supt. Buzzo at the Alice M. Co., Walkerville, has eighty men at work, some of them being lessees. The property is producing 600 tons per month, the ores carrying from 18 to 100 ounces silver and 75 cents to $10 gold. Supt. Buzzo is hopeful of several new processes for successfully treating zinc ores; one by B. B. Sadtler, who lines the retorts with a chemical combination that resists the action of the iron in melting for ninety days, and who expects to utilize zinc ores carrying 10% to 15% of iron. Heretofore the presence of 2% of iron has proved a serious objection in zinc ores in the United States, but in Europe zinc ores have been treated carrying 10% of iron, due to cheaper labor and different processes. A company is being organized to work under that process, its works to be located near Basin. Another process is being developed for leaching out the zinc, leaving the iron and silica containing the metallic values for treatment.

Plans and specifications have been drawn for the reconstruction of the Parrot mining plant. The hoist is to be replaced with a modern steel gallows-frame. The boilers were found uninjured, but everything else was completely destroyed. The fire did not get into the shaft.

NEVADA.

EUREKA COUNTY.

Sentinel: The following figures taken from the books of the county assessor show the number of properties in operation at the present time in the vicinity of Eureka, together with the names of their superintendents and the gross value of their output for the six months ending June 30, 1900:

Altoona, A. Fraser	$ 179 58
Cyanide, A. Fraser	7,076 00
Diamond and Excelsior, C. Read	40,466 09
Eureka Con., H. C. McTerney	18,812 75
Eureka tunnel, J. Pardy	3,427 52
Fraser & Moline, A. Fraser	989 28
Helen, M. Farlinger	407 79
Jackson, W. J. Hooper	6,883 94
Laurel and Hidden Jewel, J. McNoughton	683 97
Richmond, R. K. Morrison	9,477 65
Ruby & Dunderberg, R. K. Morrison	4,665 19
Tenabo M. & M. Co., S. Wenban	73,841 02
Rocco-Homestake, H. Jackson	28,000 93

ESMERALDA COUNTY.

The Huntoon mine, 40 miles south of Hawthorne, is reported bonded for $12,000.

LANDER COUNTY.

Thirteen miners have come from Eureka, Utah, to Ione, Nev., to work for the Midas M. Co.

LINCOLN COUNTY.

It is said that good reliable miners can find work at DeLamar.

Near El Dorado canyon the Southwestern M. Co., which owns seventeen claims, is excavating for a 20-stamp mill in addition to the present fifteen stamps. They have finished cyaniding the tailings that had accumulated. The cyanide plant was under the management of Mr. Van der Cook and a saving of 95% gold and 75% silver was made. An illustrated technical description of the operation of the plant appeared in the issue of Feb. 17, 1900. The ores are either shipped to Manvel, 40 miles, or taken to the river for treatment, where water can be obtained. The miners get their supplies from Searchlight, 18 miles distant, packed in on burros.

The Horseshoe mill at Fay started on the 20th.

The Consolidated Freiburg Mines has incorporated, G. E. West secretary.

STOREY COUNTY.

J. Fisher, the Six-mile canyon millman, will move his cyanide plant from the canyon to the tailings pile north of the Sierra Nevada mine waste dump. He figures he will make a saving of 60 cents per ton—the cost of hauling them by team to the present site of the cyanide plant. As the pile is estimated to contain 18,000 tons of tailings, the removal of the plant to the pile would effect a total saving of $10,800; the cost of moving the plant will be $800. The plant has a capacity of twenty tons per day.

WASHOE COUNTY.

J. R. DeLamar is locally credited with having inspected the Wedekind mine, near Reno, and pronouncing it a mineral spring deposit, analogous to the formation at Steamboat Springs. The mine is producing a carload of ore per month, averaging $200 per ton.

At Olinghouse the Ora mill is running on forty tons of ore that should net $5000. W. C. Williams, on his Cabin claim, has 16 inches of ore that shows wire gold. A pound of it was selected and $15 gold mortared out.

WHITE PINE COUNTY.

At Osceola the tungsten mine, owned by Gaby & Buntin, is being worked steadily. The output goes to New York, where it is treated and where it brings the producers $250 per ton. A concentrator is being put in.

NEW MEXICO.

BERNALILLO COUNTY.

The Cochiti has reduced its working force owing to mechanical improvements. The mill is treating 10,000 tons of ore per month. A contract for delivering ore from the mine to the ore bins has been let at 11 cents per ton.

GRANT COUNTY.

The Orion M. Co. at Shakespeare is driving development work.

The Pinos Altos G. M. Co. have advanced the wages of their engineers to $3.50 for eight hours' work.

At Pinos Altos Dimmick Bros. are pushing development on their Silver Cell group. On the 250-foot level they are raising on a stope and taking out fine ore, which will average 2000 ounces in silver. A concentrating plant for handling the lower grade product will be installed.

Dimmick Bros., while operating the Silver Cell at Pinos Altos, are prosecuting development work on the Mangus, Black Terrier, Wedge, Keystone, Climax and Silver Belle claims. A concentrating plant for handling the lower grade product is contracted for.

Mogollon district is reported more prosperous than at any time since 1893.

SANTA FE COUNTY.

R. B. Willison, near Galistoe, says he has developed a bed of mother-of-pearl.

The American Turquoise Co. at Cerrillos is reported to have made the richest strike in the history of the work at a depth of 300 feet.

SIERRA COUNTY.

The Lime Hill at Chloride has telluride gold ore.

C. H. Codding has men at work on the Hoosier Boy near Chloride.

The Sinnamahoning G. & C. M. Co. are pushing work on their Chance mine with two shifts. At the depth of 260 feet they have copper-gold ore, of which a car shipment has been sent to the El Paso smelter.

The Philadelphia M. & M. Co.'s new mill at Andrews is running full time.

SOCORRO COUNTY.

The Little Fannie at Mogollon is employing twenty-five men in development work.

The B. O. B. and the Last Chance mills have started.

TAOS COUNTY.

The New Mexico G. & C. Co. are putting a 16,000-pound boiler and hoister on their gold-copper property west of Tres Piedras.

OREGON.

BAKER COUNTY.

Sumpter reports a strike on the Concord group assaying high in gold and silver.

At Cable Cove considerable development work is being done under the direction of W. H. Jackson, former Supt. of the Golconda.

Near Sumpter the Mammoth has an incline shaft 265 feet deep. H. S. McCallum is manager.

F. J. Perkins, manager Gem mine, near Sparta, has the shaft down 460 feet.

The Climax mine is being developed.

DOUGLAS COUNTY.

Supt. R. A. Jones of the Gold Bug mine, near Glendale, says he is employing thirty men, working night and day. They have about a year and a half's work for their 5-stamp mill now in sight and are doing development work; have just completed surveying a new 1600-foot tunnel in the south side of the mountain; they are working 413 feet below the surface.

Supt. Jones of the Gold Bug mine, Mt. Reuben district, says the company is employing thirty men; they have a 5-stamp mill operating and are working 413 feet below the surface.

HARNEY COUNTY.

One hundred and twenty-five miles south from Burns, near the Nevada line, is the plant of the Rose Valley Borax Co. The borate is scraped from the earth, refined, and hauled to Winnemucca, Nev., and shipped from there. The company owns two wagon trains, consisting of three wagons each, coupled together, each drawn by twelve mules, each train making two trips a month. They carry 40,000 pounds of borax to Winnemucca each trip and bring back supplies for the country at large. The distance from the mines to Winnemucca is 125 miles.

JOSEPHINE COUNTY.

Wimer Bros.' mines in Waldo district are reported sold to Waln, Draper, et al., for $40,000. The property consists of 400 acres of ground, equipped with ditches, flumes and mining appliances.

J. S. Howard, engineer High Line Ditch Co., says the strike by J. C. Nye at Gall's creek is notable. Nye bought the prospect for $600 and sold a half interest for $9000 cash, and since that time $50,000 has been taken out.

LANE COUNTY.

A carload of machinery is at Springfield for the Blasier mine in the Blue River district.

UNION COUNTY.

The Monumental mine, 8 miles from Granite, will resume under the management of C. S. Miller.

SOUTH DAKOTA.

PENNINGTON COUNTY.

At Keystone the Holy Terror Co. has opened ore on the 700 and 800-foot levels and are milling it in their Keystone mill. The company will put in a plant for reduction of concentrates. The Elizabeth M. Co., owning the Bismarck mine, are developing their ground.

UTAH.

BEAVER COUNTY.

Manager Lewis of the Imperial M. Co. has assay certificates claiming 24.7% copper, $5.20 in gold and 8 ounces silver per ton from samples in the main crosscut off the main tunnel.

JUAB COUNTY.

Miner: At Eureka the Bullion-Beck has paid the Almo M. Co. $25,000 for the Almo group of five claims.

The report of the Centennial-Eureka M. Co. for the first six months of 1900 shows the gross earnings to be $722,655.54; of this $230,782.96 was derived from the sale of 384,638.27 ounces of silver, $302,377.50 from the sale of 14,628.81 ounces of gold and $189,495.08 from the sale of 1,148,455 pounds of copper.

SALT LAKE COUNTY.

At Bingham, the U. S. Co. has reduced rates at its boarding houses from $1 to 80 cents per day.

At Bingham, the $50,000 payment on the Dalton & Lark purchase by P. T. Farnsworth and his associates is satisfactorily arranged for, a total applied to the deal of $71,000, leaving a balance of about $300,000. Payment under the contract matures in September, when $125,000 becomes due.

TOOELE COUNTY.

Concerning the application of heat in the treatment of the Mercur tailings, Manager Cohen tells the Tribune that it would require nothing more than calcination, and that with the apparatus already in possession of the consolidated company, the expense of installing the plant would be practically nothing. He has already begun on the experiments, and with their completion will begin to prepare for the active leaching of the tailings.

UTAH COUNTY.

Manager Campbell of the Mayflower, 18 miles west of Lehi, has samples of ore that show 32% lead, 15 ounces silver and 66 cents in gold.

WASHINGTON.

FERRY COUNTY.

Sec'y Aitcheson of the Reservation M. & M. Co. tells the Spokesman-Review that the road to Grand Forks, 15 miles, is so that a four-horse team can handle five tons in a load. The new working shaft is down 175 feet, and is advancing about 40 feet a month. The compressor has not been started up; mining is being done with hand drills.

J. H. Gallagher, general manager American M. & D. Co., Curlew, will put a 12 H. P. hoist on the Drummers' group. He says the ore "assays 2% copper, 6% lead and the balance in silver," and that he has arranged to put up a forty-ton smelter. The company is employing fifty-four men.

The Republic, Quilp, Lone Pine and Tom Thumb mines are reported about to be united under one management. W. Miller of New York and C. J. McCuag of Montreal are credited with intention to form the combination.

C. McCuiag says that he has a syndicate ready to build a railroad from Republic to Grand Forks, B. C.

OKANOGAN COUNTY.

In the Methow district in the Eureka the ore from the surface down 100 feet was in a chimney; little of value outside of it. At 100 feet the chimney ended and prospecting was begun to find its continuation. A drift was run and a winze sunk, and another chimney of different ore, but of equal richness and greater size, was found some distance to one side and below the other one. Work in this second chimney shows it to measure 33 feet one way.

At Loomis the Palmer Mountain tunnel is in 3475 feet. Its ultimate length will be 8400 feet and depth 4000 feet vertical.

The Golden Zone M. Co. has 3000 feet of tunnels.

The Black Bear, down to the 250-foot level, is reported producing $7000 monthly with five stamps.

Winthrop reports a clean-up of the 5-stamp mill of the Mammoth, on Slate creek, Methow district, giving returns equal to $300 per day.

The mill of the Eureka, on Slate creek, is running. The plates look well for the length of the run. The gravity tramway from the mine to the mill, 2000 feet up a steep incline, is being operated.

STEVENS COUNTY.

A contract has been let to increase the capacity of the Northport smelter, associated with the Le Roi mines, from 750 to 1100 tons a day.

WYOMING.

CARBON COUNTY.

(Special Correspondence). — Keener Bros., having three claims near this place, have discovered a ledge of copper glance, 20 inches wide, which ran 54% copper. The ledge was on the surface, and sinking is in progress to determine the extent of the ore.

Battle Lake, Aug. 9.

At Battle Lake district, in the property of the Evening Star M. Co., ore is being taken out that averages 35% copper.

Reports from the Ferris-Haggarty copper mine, Battle Lake district, are to the effect that it will be transferred to Manhattan Investment Co. of Denver at an alleged price of $2,000,000.

FREMONT COUNTY.

At South Pass, the Carrisa M. Co. has a 10-stamp mill.

The Mary Ellen mine is being developed by the South Pass M. & M. Co. J. P.

Ibson, manager; M. Lewellyn, foreman.

The Garfield is being worked by Waugh Bros.; C. E. Ross, manager.

FOREIGN.

BRITISH COLUMBIA.

The Lillooet Prospector says in Bridge River district five arrastras are running in a radius of half a mile, all turning out gold and averaging from $75 to $100 per day.

At Nelson the Hall Mines smelter resumed this week.

A. H. Bromley brought to Victoria the first gold brick from the product of the Atlin quartz ledges—twenty-eight ounces, taken from the plates of the Nimrod Co.'s machinery in its 5-stamp mill at Atlin, said to be the most northerly in the mining world.

It is locally reported that the C. P. Railroad Co. will sell the smelter at Trail to the British-American Corporation of London, which owns mines at Rossland. The smelter was built by F. A. Heinze of Butte, Mont., in 1895, and by him sold to the Canadian Pacific Railroad Co. for $500,000.

Placer mining operations at Wreck bay, Vancouver Island, are of increasing magnitude. The large flume running 6 miles inland from the beach is about completed; modern machines for the washing of the gold from the sand are being put in. The ton or yard of beach land that is run through the machines now operated return on an average $4 gold. Forty men are employed on the flume. The bay is exposed to every blast, and, as the big seas roll in, parts of the embankments are carried seaward, and then the deposits are swept shoreward, this reactionary process accounting, it is thought, for the prevalence of the gold on the beach.

V. R. Pierson reports placer gold on the west coast of Vancouver island, 12 miles south of the Helga mining properties. He says there is a 3-mile stretch of beach at the point indicated where the gold is of all sizes, from half a pea down to mere atoms. The formation of the ground is, first, 18 inches of sand and gravel; then 30 inches of gray and black sand carrying placer gold; then 12 inches of clay; then 18 inches more of pay streak, richer than the first encountered; then the clay hard pan.

Ashcroft, Cariboo, reports that R. H. Campbell of California has broken through into gravel at the Horsefly. The work has been pushed on a three-compartment shaft 5x15 feet. At 490 feet last season bedrock was reached, but it was found to be pitching off and smooth, it holding no gravel. Mr. Campbell put in heavier machinery and sunk 60 feet in bedrock, then started to drift across the channel. At 300 feet, not having struck the channel, he made an upraise of 15 feet, and is now stated to have broken through into gravel.

MEXICO.

At Tizucutlan the Aurora mine, owned by St. Louis men, is managed by M. Barron. The product is copper, with gold and silver. Power is partly supplied from a stream of water which has a fall of 1000 meters and from which the electric plant is operated. The company is working about 1000 men.

The concentrator and smelter at the Nacosari mines, Copper Queen Co., Nacosari, Sonora, will begin treating ore Nov. 1.

The Herald says some of the ore shipped from the Candelaria mine, in the Sabinal district, Chihuahua, runs 2000 ounces of silver to the ton.

At Minas Prietas the Creston-Colorada M. Co. is negotiating with the proprietors of the Fortuna, adjacent to the Creston mine, for a working bond upon the latter property.

W. Perry of Sidney, Ohio, has bought some abandoned silver mines in Tasco and proposes to resume work thereon.

KOREA.

In Ting Yan, the northern province, a cyanide plant to treat the tailings from the mills at the mines will go from San Francisco this month for the Oriental M. Co., limited, which has a concession of 1000 square miles of territory in the district for their operation. They are the Chitabalbie, Tobowie and Cook San Down, operated by three stamp mills, aggregating eighty stamps. The ore is a free milling and concentrating quartz, and 65% of the values are saved on the plates. The three mines employ 3000 natives and 200 American miners.

Recently Declared Mining Dividends.

Gold Belt M. I. Co., Colorado, $112,500, 9 cents a share on 1,250,000 shares	Aug. 15
Quincy C. M. Co., Michigan, $4 per share, $400,000	Aug. 15
Arizona C. M. Co., Arizona, 84 cents per share, $132,943	Sept. 30

Personal.

J. W. Boles succeeds Secretary Hiller at the Cherokee M. Co., Cherokee, Cal.

H. T. Power has returned to Placer county, Cal., from an extended Eastern trip.

Henry Moore has been appointed Supt. Mazeppa, mine Tuolumne county, Cal.

B. Hermann, U. S. General Land Commissioner, is expected in San Francisco next week.

C. E. DeForrest succeeds Supt. Edlin at the War Eagle Consolidated, Quartzburg, Idaho.

V. V. Clark succeeds E. McNab in charge of the cyanide plant at the Albemarle mill, Bland, N. M.

General Manager Anderson of the Gold & Silver Extraction Co. of America will return from Europe to Denver, Colo., this month.

C. M. Fassett of Spokane, Wash., leaves San Francisco on the 21st to oversee the installation of a cyanide plant in Ting Yan, the northern province of Korea.

Charles D. Lane has returned to San Francisco from Nome, where he put in a $150,000 plant to work the creek instead of the beach. He believes his venture will prove remunerative.

Geo. F. Ismon will succeed Frank L. Brown in the San Francisco office of the American Steel & Wire Co. Mr. Walker has returned to San Francisco from Portland, Or., and will assist Mr. Ismon.

Ex-Senator Warner Miller of New York, who has a bond on a Shasta county, Cal., property, says: "There is a noticeable gain in the popularity of Western mining securities in the East. With the introduction of scientific and business methods in the conduct of mining enterprises and the improvements in the methods of treatment, mining has been made a business as much as a speculation. It is beginning to be recognized that a mining enterprise is made successful by putting men of scientific training and the widest possible experience at the head of operations and business men of capacity at the business end. There is, in consequence, a strong movement towards mining as a business."

Commercial Paragraphs.

Two large shipments of Cross oil filters were made by the Burt Mfg. Co. of Akron, Ohio, to France during the month of July, as the direct result of their exhibit at the Paris Exposition.

The Gates Iron Works have the contract to equip and erect a 150-ton cyanide plant at the Annie Laurie mine, near Marysvale, Utah. J. M. Callow of Salt Lake City represents the Gates people in this matter.

W. H. Emanuel shipped last week to the Bassick mine, at Silver Cliff, Custer City, Colo., a 14 and 24x22-inch cross-compound air compressor, with air and steam high and low-pressure cylinders, having Meyer adjustable cut-off. The capacity of compressor is 1200 cubic feet of air per minute.

United States Consul Hughes writes from Coburg: "In these times, when coal is hard to obtain, our American turbine-wheel houses ought to give special attention to supplying southern Germany with improved machinery for utilizing the water power which is now running to waste, especially in Thuringia. They should send salesmen who can speak German and know how to operate the machines. The only water-wheel known here is the old-fashioned one."

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Bottle Faucet Attachment.—No. 655,345. Aug. 7, 1900. H. A. Knight, Alameda, Cal. The object of this invention is to provide for the more perfect charging of carbonic acid gas and the like into bottles containing liquids, whereby the latter are made effervescent, and a means for withdrawing the contents of the bottle in small quantities as needed without injuriously reducing the quantity or pressure of gas in the remaining liquid, the whole designed to operate without the removal of the stopper and connected parts. It consists of a tubular screw-threaded stopper fitting corresponding threads in the neck of the bottle, having a flange and washer to form a joint, and a tubular extension above and below the stopper. A cap is provided with a stopper to fit this extension having a central and packed valve stem, and a valve at its lower end closable upon a seat within the stopper. The cap also forms an exterior screw-threaded sleeve fitting upon the outside of the stopper extension, and an inwardly open spring-pressed valve is provided for charging the bottle, this valve having a stem extending through the stopper, and the cap upon the upper end with admission channels formed through it.

Method of Making Superphosphates.—No. 655,458. Aug. 7, 1900. Heinrich Saxl, San Francisco, Cal., one-half assigned to A. A. Adler, of same place. This invention is designed to provide a concentrated easily soluble phosphoric acid, and to produce superphosphates rich in fertilizing material. It consists in first producing normal superphosphates by subjecting the phosphate of lime containing the material to the action of sulphuric acid, then mixing the mass with water, separating out the liquid and evaporating it, then mixing with the product the second body of phosphate-containing material, withdrawing the resultant mass and separating the liquid therefrom.

Grain Drill Attachments.—No. 655,334. Aug. 7, 1900. Wm. Falconer, Selma, Cal. This invention relates to an attachment for grain drills of that class in which the grain is delivered from a reservoir or feed box through tubes and shoes at the lower ends, these shoes forming drills to receive the grain, and the object is to provide a supplemental attachment by which the pressure upon the heel of the shoe can be regulated so as to insure the drill being made of sufficient depth in hard or lumpy ground, and to prevent it from going too deep where the ground is soft and sandy. The front ends of the shoes have elastic connections and supports; standards are flexibly connected with each shoe at the point in the rear of the forward connections and extending upwardly from their point of attachment. A fixed bar having holes through which the standards are slidable acts to limit the movement of the standards by reason of pins or stops which are adjustably fixed to the standards to contact with the bar. Spiral springs surround the standards, the ends pressing respectively against the bar and against the adjustable stops so that pressure is exerted to force the heels of the shoes into the ground, while other pins or stops fixed to the standard above the bar limit the depth to which the shoes are forced in the ground when the latter is soft.

Axle Lubricator. — No. 655,347. Aug. 7, 1900. J. E. Ludwig, San Francisco, Cal. This device is designed for the lubrication of vehicle axles without the removing of the wheels, and is particularly adapted for heavily loaded vehicles, such as large wagons loaded with freight which is to be carried for a number of days before reaching its destination. It consists of a lubricant reservoir, with means for connecting it with the outer end of the axle to be lubricated, and means for forming a tight joint therewith. With this is a device by which the lubricant may be forced into the space between the axle and axle-box, this device being in the form of a plunger or piston movable in the lubricant-containing cylinder, so that when the piston is forced inwardly, the lubricant will be passed through the connecting passage and into the space between the axle-box and the axle in sufficient quantities for the purpose.

Hop Bleaching and Drying Kiln.—No. 655,330. Aug. 7, 1900. J. & A. B. C. Dowdell, St. Helena, Cal. This invention is designed to bleach and dry hops. It consists of a room or compartment having a foraminous floor adapted to support the hops to be dried, and in conjunction with this of a covering which may be drawn over the surface of the hops to confine and prevent the heat and moisture from escaping therefrom during the process of bleaching. The sulphur fumes are produced in any suitable manner and delivered from below so as to rise into the hops, and are there retained by the superposed covering until the bleaching is perfected. The covering is then withdrawn, and heat being applied the drying will be completed in the usual manner. In this manner the hops are very perfectly bleached with a minimum expenditure of time and material.

Concentrator.—No. 655,470. Aug. 7, 1900. W. H. Washburn, of Oroville Wash., one-half assigned to J. B. Washburn, Baker City, Or. This invention is an improvement in concentrators of that class of the endless traveling and shaking belt type. It consists of a water supply device with discharge openings, a distributer or spreader having oppositely inclined surface adapted to reciprocate beneath these openings and having a series of divergent channels alternately supplied from the water-box. The distributer has also a series of discharge openings at opposite edges and gates by which the amount of water delivered to the channels is regulated.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING AUGUST 7, 1900.

Latest Market Reports.

San Francisco, Aug. 16, 1900.

SILVER—Per oz., Troy: London, 28⅛d (standard ounce, 925 fine); New York, bar silver, 61c (1000 fine); San Francisco, 61c; Mexican dollars, 49c.

The following table shows the stocks of gold and silver money in the aggregate in the countries now represented in China by troops or warships:

Country.	Stock of gold.	Stock of silver.
United States	$945,800,000	$329,700,000
Great Britain	462,300,000	111,900,000
France	810,600,000	420,100,000
Germany	672,800,000	208,200,000
Russia	740,400,000	5,400,000
Italy	98,000,000	43,900,000
Austria	221,400,000	147,300,000
China	....	....
Japan	54,000,000	29,000,000

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.62½; carload lots, 16.37½; Casting, 1 to 3 casks, 16.50; carload lots, 16.30. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

Under date of Aug. 2, Jas. Lewis & Son of Liverpool report:

The great developments now taking place in England in the application of electric traction and power; the additional telegraph cables about to be laid (including the Pacific cable of 8800 miles, estimated to require some 4000 tons of copper); the large quantities of copper used for ammunition; and the additional 5000 tons required for the manufacture of sulphate of copper during the next six months; will necessitate a great increase in the consumption of copper in this country for the rest of this year.

As the stocks held in the United States are much less now than a year ago, and shipments from thence during the second half of this year promise to be much less than during the first half, the increase in the production of the United States of 8% and in the total supplies to Europe and the United States of 7½%, which so far has taken place, appears insufficient to supply the probable increase in the consumption.

LEAD.—New York, $4.25; Salt Lake City, $4.00; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £18 = 3.91c per ℔.

The new prices of the American Smelting & Refining Co., 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$4 20	$4 30
Chicago	4 20	4 30
Cincinnati	4 25	4 35
Pittsburg	4 30	4 40
Philadelphia	4 30	4 40
New York	4 25	4 35
Boston	4 32½	4 42½

On carload lots 5c. per 100 ℔s. higher.

The American Smelting & Refining Co. has issued a circular announcing that it has arranged with the principal lead producers of the country to pay a flat rate of $4 per 100 pounds, without the usual 12½% reduction, and to maintain that price for the remainder of the year, taking whatever steps are necessary in the way of exporting lead, etc., to maintain the price. This proposition was submitted to the company by the leading producers, as it was realized that unless some action of this kind was taken lead would inevitably fall to the export price of about $3.60 per 100 pounds.

SPELTER. — New York, $4.22½; St. Louis, $4.15; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $17; gray forge, $15; San Francisco, bar, per lb., 2¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $18.00; bars, 1.20; tank plate, 1.00; San Francisco, bar, 7c to 12c per lb.

QUICKSILVER. — New York, $50.00; large lots: London, £9 5s; San Francisco, local, $48@48.50 ℔ flask of 76½ ℔s.; Export, about $45.

The entire quicksilver situation seems anomalous and unsettled. Underproduction is asserted, higher prices are predicted, yet the market sags.

MAGNESIUM.—New York, $3.00 ℔ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21½c; San Francisco, Plumbers', 100-℔. lots, 18¼c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $31.75; San Francisco, ton lots, 33¾c; 1000 ℔s., 34¼c; 500 ℔s., 34¼c; less, 35c; bar tin, ℔ ℔, 39c.

ASSAY LITHARGE.—San Francisco, 10c ℔ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ℔ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ℔ ℔.

TUNGSTEN.—New York, ℔ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ℔ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℔ ℔.; soda ash, $1.60 ℔ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℔ ℔.; blue vitriol, 5½@6c ℔ ℔.; borax, concentrated, 7@8c ℔ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ ℔.; caustic soda, in drums, 3@4c ℔ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 ℔s.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 79c; cs., 84c; raw, bbl., 77c; cs., 82c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

PHOSPHORUS. — F. o. b. New York or Philadelphia, 45@50c ℔ ℔.

CANDLES.—Granite 6s, 16 oz., 40s., 12¼c ℔ set; 14 oz., 40s., 11¼c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

Hot Water
Fed to your boiler is more economical than cold, and the hotter the feed water the greater the economy.
How hot will your Injector handle it?

THE U. S.
INJECTOR

Makes a point right here. It handles hotter water than any other Injector made.
It also has a wider range, a very important feature sometimes.
In fact, there's a number of good strong points about the U. S. that are only known to those who use them.
Our little "ENGINEER'S RED BOOK" tells about them and also about 500 other things an engineer ought to know. It's a vest pocket reference book. Write for one.

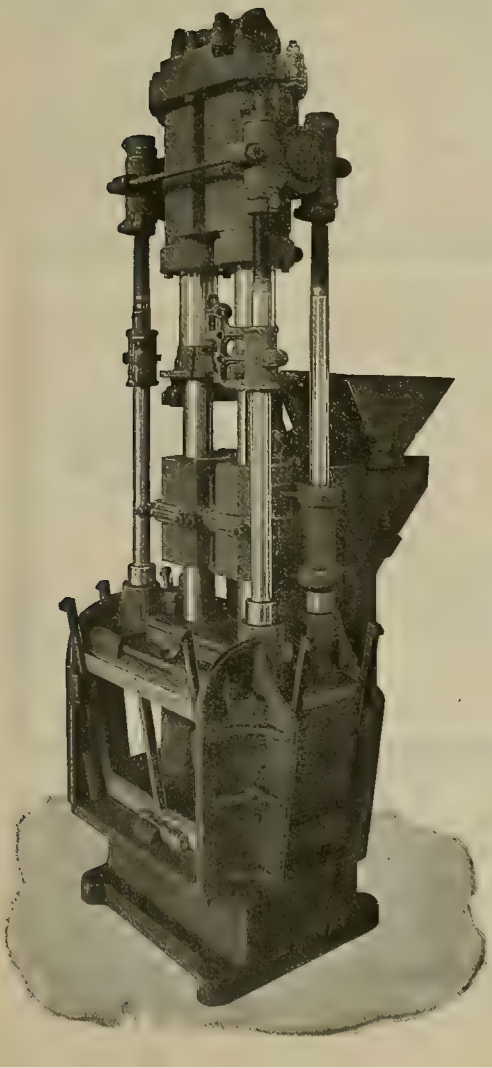
CATES IRON WORKS.



THE TREMAIN STEAM STAMP MILL

has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After an experience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I have found it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,
[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 180 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,
M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ., AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,
[SIGNED] GEO. HEWER.

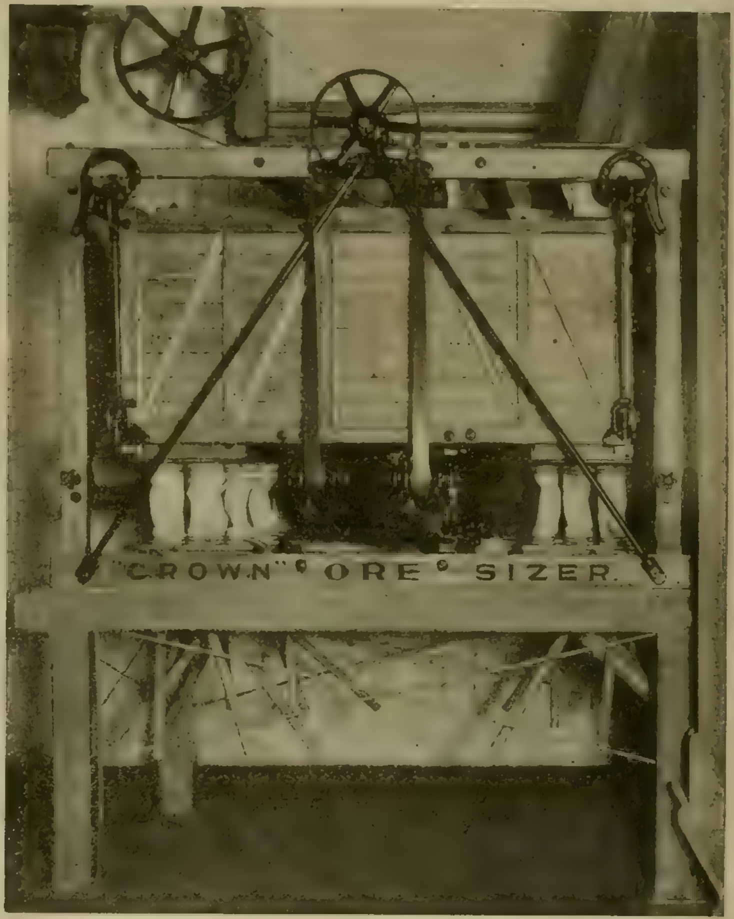
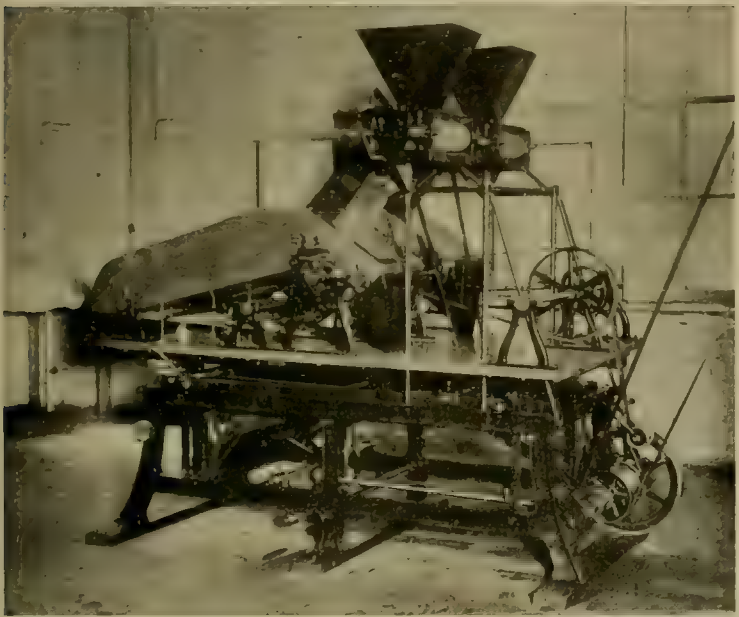
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.





Works, 23 Stevenson St. Office, 230 Post St. SAN FRANCISCO, CAL.

NO TROUBLE TO OPERATE--A BOY COULD RUN IT.

TO ASSAYERS:

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simp.y constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SMOOTH-ON CASTINGS.
TRADE MARK

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 600 tons having been handled in ten hours time."

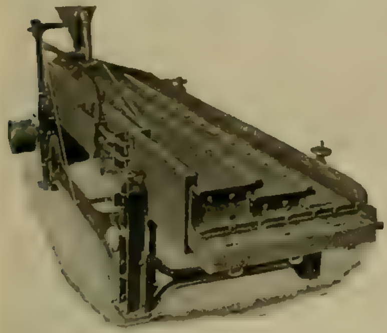
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

331 Pine Street,............San Francisco, Cal.
Telephone Main 1870. Cable Address "Edben."

JOHN W. GRAY,
Mining and Hydraulic Work.

Prospecting Operations and Exploration Work.
Examinations, Surveys, Development, Equipment of Mines, Gold-Bearing Gravels, and Water Supplies.
923 Linden St.,..................Oakland, Cal.
Cable "Espra." Correspondence invited.

ABBOT A. HANKS,
CHEMIST AND ASSAYER.
Successor to Henry G. Hanks, est. 1866. The supervision of sampling of ores shipped to San Francisco a specialty.
—531—
California Street,
San Francisco.

RICHARD A. PEREZ, E. M.
Assayer and Analytical Chemist,
120 North Main St., - Los Angeles, Cal.

S. W. TYLER,
Mining and Metallurgical Engineer,
6 Windsor Hotel Block.
Cable: Retyl, Denver. DENVER, COLORADO.

The SPOKANE BUREAU OF MINING,
N. E. LINSLEY, Manager.
SPOKANE, : : WASHINGTON.
Consulting Mining and Milling Engineer.
Will Examine and Report on Mines.

DANIEL G. JEWETT,
Metallurgist and Assayer.
Specialty: The Mining and Smelting of Copper or Lead Ores.
P. O. BOX 5, GUFFEY, PARK CO., COLO.

CLARENCE HERSEY,
Assayer and Chemist,
(Established 1879.) LEADVILLE, COLO.
Gold, Silver and Lead..................$1.00.
Any two of above 75c; any one of above 50c.
Copper analysis..................................$1.00.
Platinum, Nickel or Tin, each..............$5.00.
Twenty-one years successful experience in the mining metropolis of Colorado.
Write for mailing envelopes and price list.

ALMARIN B. PAUL, M. E.,
ROOM 27, CROCKER BUILDING, SAN FRANCISCO.
Will act as AGENT for the sale of RELIABLE Mining Property. SPECIAL AGENT FOR
MacArthur-Forrest Cyanide Process
for California north of and including Mono, Madera and Merced counties; also for State of Nevada. Will act as agent for Eastern parties owning mining interests in California.

F. H. HARVEY,
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

Simonds & Wainwright,
Mining Engineers,
Assayers and Chemists,
159 Front Street,
NEW YORK.

HUDSON H. NICHOLSON,
Consulting Mining Engineer,
Rooms 216 and 217, Boston Building,
DENVER, COLO., U. S. A.
Cable address: Aichen, Denver.
Expert examinations of and advisory reports on mining propositions.
Specialty: The chemical treatment of ores

DAVIDGE & DAVIDGE, Attorneys and Counsellors at Law, Corcoran Building, Washington, D. C. Practice in the Supreme Court of the United States, the Court of Claims, the Courts of the District of Columbia, and the General Land Office. Western Union Code.

Importers and Manufacturers of Assayers' Materials, Chemicals and Acids, Etc.
CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

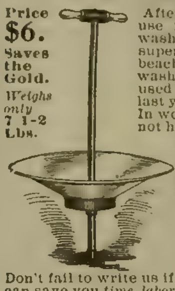
THE LITTLE ALASKA GOLD WASHER.

Price $6.
Saves the Gold.
Weighs only 7 1-2 Lbs.



After several years practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave, Los Angeles, Cal

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

THE COLORADO IRON WORKS CO.

ESTABLISHED
1860.

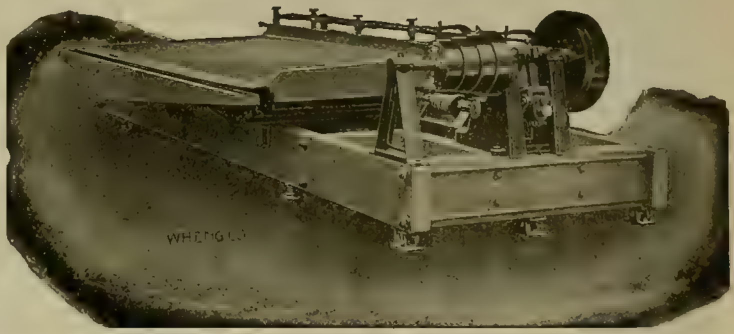
DENVER, COLO., U. S. A.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post**, July 15th, 1900.

* * * "Now about concentrating tables. Here's a fellow who says there's nothing equal to the Wilfley, and I am trying to convince him that old man Woodbury over in California makes the finest table in the world." "No, sir," said his comrade, "you're way off. I've tried the CAMMETT too thoroughly to believe there's anything made to equal it."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

Denver Engineering Works,---Shepard & Searing,---Sole Manufacturers,

30th and Blake Streets, - - - - DENVER, COLORADO.

ASSESSMENT NOTICES.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1900, an assessment (No. 91) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 71) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, San Francisco, California.

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1900, an assessment (No. 101) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

The Lunkenheimer
("99" MODEL)
Standard Injector.
UNIVERSALLY APPLICABLE.

This machine is warranted to show in actual service results hitherto unattainable with any other make of injector on the market. With feed water at 75° F., LIFT 6 FEET, it will work WITHOUT ADJUSTMENT OF STEAM OR WATER AT ALL PRESSURES FROM 40 TO 250 LBS., AND HIGHER, AND THE CAPACITY CAN BE GRADED OVER 50% AT ANY POINT in that range of work. Note carefully, ALL CONDITIONS ARE MENTIONED in this statement. The construction is simple and free from all complicated mechanism. All parts are easily accessible and tubes are very durable. In grading the capacity, the steam supply is cut down in proportion to the water, hence the discharge is cool and scale is not so liable to form.

It is thoroughly reliable and can be started promptly under the most extreme conditions, and UNLIKE many others its efficiency is not confined to any particular season of the year The capacity increases with the pressure. A trial is solicited and satisfaction guaranteed. Write for Catalogue of superior brass and iron Steam Specialties.

Economic and Mining Geology.

In the issue of the 11th inst., considerable space was given to the statements of Director Walcott of the U. S. Geological Survey concerning the relation of the work in which he and his assistants are engaged to the mining industry.

In continuance of this subject, so important to the miners of this west half of America, is given further space to additional statements of Director Walcott in connection with the economic and mining geology of the U. S. Geological Survey. He desires to define the difference between the work of the Survey and the domain of private enterprise, and to show the status and limitations of the branch of the public service that he directs. He says:

It is well known that in creating the United States Geological Survey Congress and the people whom it represents expected that its energies would be largely devoted to the development of the mineral resources of the country. How this method should be accomplished was left to the Director and his principal assistants, who, by scientific training and long practical experience, were the best qualified to judge what could and what could not be done by such a corps of specialists as the Survey must necessarily consist of—men whose whole life is devoted to the abstract side of geology and whom neither the regulations of the Survey as defined by law nor the exigencies of their official duties would permit to participate in the practical or commercial development of these resources.

It was evident that these specialists could not take the place of either the prospector or the mining engineer, as a somewhat superficial view of the subject has led some to think they might. They should, of course, understand the principles that underlie the work of either of these classes of men, but they can not be expected to possess that expertness of instinctive second sense in each of these professions which can be acquired only by lifelong practice.

The Survey should furnish an accurate basis upon which the work of each of these experts, so indispensable in the development of the mineral resources of the country, may be founded. The Survey stands, so to speak, between them and nature. It should endeavor to tell the prospector where he may and where he may not prospect to advantage for this or that valuable mineral, but it can not be expected to actually find the mineral for him. It should aim to discover for the mining engineer first of all the general laws which govern the occurrence of the different useful minerals, and to show the special applications of these laws in the particular mining regions that come under survey; but it can not undertake to direct the workings of individual mines or quarries, nor guarantee that every mining engineer will make a correct application of the laws that have been discovered.

In the early years of the Survey there were practically no topographic maps upon which the surface distribution of different classes of rock formations could be indicated (areal geology), and which should thus serve as a basis for the work of the prospector. Hence it was only the study of the already developed ore deposits, for the purpose of determining the laws under which they were formed, that could be immediately undertaken. A number of monographs or exhaustive studies of important mining districts were made, during which several new laws or generalizations concerning the formation of ore deposits in general were formulated. Incidentally, the accurate geological descriptions contained in these monographs proved to be of great practical value to those engaged in mining in these particular districts. By these studies, conducted for the most part at great depths below the surface, those engaged in them acquired a practical familarity with many geological phenomena connected with ore deposits that could not be seen upon the surface, and were thereby specially fitted to judge of ore bearing capabilities of rock formations in general. This constitutes a special training that can not be acquired in the schools, but can only be imparted to the young geologist by actual experience in mining or economic work under the guidance and instruction of older geologists who have already gained it by long continued special work.

During the last five years the topographic maps of very large areas have been completed, constituting several hundred of the sheets that will form the basis of the Geologic Atlas of the United States. Many of these sheets have already been colored geologically—that is, the areal geology has been completed—and they have been published as geologic folios. In a few cases the areas have also been studied economically; that is, the manner of occurrence of the known ore deposits has been observed, and deductions drawn therefrom are given in the folio, which will show the prospector where similar favorable conditions exist, and where, in consequence, are the most promising localities to search for other ore deposits. The latter class of work is more difficult and more expensive, for many reasons, than other geological work.

The increase in effectiveness of this work must, however, proceed slowly. Even with unlimited amounts of money immediately available the economic work of the Survey could not at once be spread over the whole country, as it should be, for the reason that it would take time to train the additional number of specially prepared geologists required. But there is no doubt that by a natural enlargement of the present plan of work the demands of the mining community for Government aid in the development of their particular branch of industry can readily be largely met.

It has been generally understood that information acquired by the Government is open to all and is not for the benefit of one individual or corporation. Language to this effect was inserted in the statute organizing the Geological Survey, in 1879. This, then, draws the line between public and private interests. There is more or less extended desire that assays and analyses and examinations of prospects and mines should be undertaken by the General Government; but it would seem to be clear that expert work and assaying should be left to individuals and corporations, so far as General Government is concerned. State mining bureaus or schools of mines can properly assist in the study of details and lend much aid to local development, but the General Government should deal only with interstate and such other problems as the State can not well undertake.

◆

FROM nearly every part of the foothill and mountain region of California comes the usual annual statement that milling operations are ceasing because of the scarcity of water. The annual gold yield of California is in exact ratio with the amount of rain and snowfall. With adequate system of water storage the normal supply would serve throughout the greater part of the year. The subject is one that has received constant and intelligent attention, but is necessarily difficult of successful solution. The California Miners' Association has recognized the importance of the subject and has made tentative efforts to remedy existing evils. The recently organized State Water and Forest Association is the result of such work, and that association has its co-operative support. In the practical carrying out of the plans of the Water and Forest Association lies largely the ultimate satisfactory solution of this important problem.

The Menace of Fire.

From all parts of the mining area of the country come reports of devastation by forest fires, entailing loss. The deplorable destruction of private interests is even surpassed by the direct public loss. The daily press rightly reasons that drastic measures of repression must be put in force. The miscreant who deliberately burns his neighbor's property is no less a destroyer than the careless idiot who drops a cigarette in a bunch of dry grass and burns out a whole country side. Most things are becoming foolproof, but as yet much is at the mercy of the itinerant, who, in ignorance or defiance of results, carelessly causes a fire to spread destructively over a wide area. Colorado and California have suffered great damage in this way, as have other States; and, while nearly every commonwealth has a law making such occasioning of fires a penal offense, there is little effort at enforcement. 'Tis true there should be an era of stern repression; a few examples are needed.

Washington, D. C., reports that a scientific investigation of forest fires and reforestation on burnt areas is being pursued by the Division of Forestry through C. S. Crandall of the Colorado experiment station. This work will be carried on chiefly in the northern part of the State, where the prevalence of Lodgepole pine makes the conditions very different from those in the south. The investigation is an important one, for, until the forester knows what to expect from fire and how to deal with burnt-over areas, he can do little in a region where burning has been as extensive and is still as common as in Colorado.

In this investigation the examination of the first stages of reforestation will be made on areas of which some were burned over thirteen years ago, and on which others in government employ had already made surveys and recorded progress at different periods since. In the case of the old fires of which there is no record, the date of burning can usually be determined by the age of the trees which came up after the fire, and the necessary surveys and measurements can then be made.

Mr. Crandall will have four assistants and will begin his examination in the Medicine Bow range. From there he will work down the Continental Divide to the neighborhood of Long's peak.

G. B. Sudworth, the dendrologist of the Division of Forestry, is in the Sierra forest reserve of California to determine the feasibility and cost of making a forest working plan for the reserve. Such a working plan would be a detailed and scientific programme for managing the reserve and harvesting its timber crop in such a way that the forests and their productive power would be maintained. This would imply the careful regulation of cutting and grazing, the adaptation of a system of protection from fire and trespass to the needs of each locality and provision for the maintenance of the water supply in the regions dependent on the reserve for irrigation. It would make it possible to bring the reserve to the point of highest usefulness under skilled and farsighted management. Unlike much of the reserved land in California, a good deal of the region in the northern part of the Sierra reserve, which is within the range of the Bigtree and the upper limit of which is the southern boundary of the Yosemite National Park, is heavily timbered. A working plan would therefore provide not so much for the production of forest growth as for its maintenance.

Mr. Sudworth will also gather material for a report on the composition and stand of timber in the reserve and its commercial importance, the classification of the various lands and the origin, extent and character of fires.

Concentrates.

THE weight of one cubic inch of rolled steel is 0.2833 pound.

ONE SECOND-FOOT is figured to equal 50 California miners' inches or 40 Colorado miners' inches.

THERE is no mining directory for California or any other State that is of more than transitory value.

THE bottom of the shaft of the Kennedy mine, Amador county, Cal., is 750 feet below the level of the sea.

THE heating surface exposed to the fire is the actual heating surface of the boiler, on which its capacity depends.

A SOLUTION of one part picric acid and seventy-five parts water will relieve an ordinary burn occasioned by the electric current.

A DISCOVERY OF MINERAL on each twenty acres of a placer location serves to except the whole location from school indemnity selection.

EXTENDED EXPERIMENTS indicate that to the ton of ore milled gold is absorbed by new copper plates to the extent of one-half a pennyweight.

IN the Seattle-Tacoma, Wash., electrical transmission there are two aluminum circuits to each city; the voltage of transmission is 30,000; distance, 30 miles.

IN a flywheel whose radius to the center of the rim is 15.5 inches, weight 100 pounds, and speed 280 revolutions per minute, the centrifugal force is 3,451 pounds.

EXPLOSION, blowing out or scattering of lead poured around a wet joint may be avoided by putting a piece of resin the size of one's thumb into the ladle, and allowing it to melt before pouring.

LORD KELVIN has said, "I believe that with proper apparatus electric current can be carried as far as 300 miles, and used for commercial purposes," and electricians are inclined to agree with him.

ANY ONE can tell just what a back number of any procurable issue of this paper would cost postpaid; current issues, 10 cents each; for the previous year 15 cents; for the next preceding year 20 cents, and so on.

THERE is no regular rate of increase in the temperature of air as it is compressed. Assuming that the air is dry, at twenty-one atmospheres or 294 pounds, by the gauge, the temperature would be 742° F.; for eight atmospheres, 494°.

CALIFORNIA STAMPS are made as heavy as 1400 pounds. At the Banner mine, near Oroville, Cal., forty stamps, each weighing 1200 pounds, dropped 110 times a minute, each crushing four and one-half tons quartz ore every twenty-four hours.

THE U. S. government will not issue a patent for a divided or undivided interest in a mining claim. But a joint owner can get the claim patented against the wishes of the other co-owner or owners, and in making entry may use the names of dissenting owners.

THE Civil Code of California defines hydraulic mining to be "mining by means of the application of water under pressure through a nozzle against a natural bank." The California Debris Commission defines it to be "mining by means of water under pressure through a nozzle."

CEMENTATION is understood to mean the filling of mineral cavities or interstitial space therein by deposition from solutions, chemical action not being involved. Metasomatism is the conversion of one rock or of an aggregate of minerals into another of wholly different chemical composition.

IN the "life of a gold lode mine" enter several factors; prominent among them are the amount of ore available, the number and capacity of the stamps, the method of working, the desire for dividends, the skill of the manager and other considerations that necessarily render any general calculation only approximate.

THIS paper will be pleased to receive from any of its readers statements of work done or results accomplished, or other matters of general interest, accompanied by such detail and data as would make the matter plain. Where practicable, photos or sketches would be of additional value in presenting the subject.

FROM a pattern made of soft pine, put together with nails, an iron casting will weigh about sixteen pounds to every pound of the pattern's weight. A brass casting will weigh eighteen pounds to each pound of the pattern's weight. An alloy nine parts lead, two parts antimony and one part bismuth will expand in cooling.

THE extraction of 95% by the chlorination process from gold ore going $100 to the ton would be good result. The ore loses about 24% of its weight in roasting and leaching. Tailings in the case would assay about $6 per ton, and for every 100 tons of ore treated there would be about 76 tons tailings, containing about $456, gold.

TO PREPARE PROOF GOLD, dissolve several ounces fine gold in nitro-muriatic acid; allow to stand several days, that any silver chloride present may settle; filter the solution; evaporate to crystallization. After diluting copiously with distilled water place the solution in a receptacle, from which it is allowed to pour slowly into a glass jar containing several small pieces of pure aluminum; the gold is at once converted from chloride to metallic; considerable heat is generated; remove the larger pieces of aluminum, pour off the solution; wash the gold precipitate several times to remove any acid. Then add muriatic acid and heat to dissolve any minute particles of aluminum, after which wash well till free from acid: then dry and melt the gold, which should be proof 1000 fine if proper care has been exercised.

ABOUT one ounce to the gallon of water is the maximum amount of cyanide California millmen generally use in cleaning amalgamating plates. This often requires dilution until is found the least amount that will accomplish the result desired. There is great diversity of opinion in regard to this subject, some four authorities varying from less than one-half ounce up to eight ounces per gallon. No particular character of ore is specified.

CARBOLITE, from which ethylene, a rival of acetylene, is generated, is made from slag at Hammond, Ind. The process of converting the slag into a white metallic substance of twice the weight of gold is by impregnating the molten slag with pulverized coke and then subjecting the mixture to an electrical process whereby the whole is fused. It is claimed that each pound of the product will produce 5 feet of the gas, each foot equal to 15 of coal or water gas in illuminating power.

UNDER ordinary conditions of use, superheated steam is saturated steam to which heat has been added without raising its pressure, but, under the same conditions, the volume is increased. If saturated steam is confined in a separate vessel from that in which it was generated, and more heat applied, it becomes superheated, and as it can not increase in volume under these conditions its pressure is increased. The dearer the fuel the more incentive there is to use superheated steam. Where fuel is very costly it is economical to use superheated steam.

THE air consumed by a given compressed air engine may be calculated from the volume, pressure and temperature at cut-off or release, and the volume, temperature and pressure at compression, in the same way that the indicated consumption of a steam engine is calculated; but in this case the indicated and actual consumption should be the same, since there is no change of state of the working fluid. Since the intrinsic energy of a gas is a function of the temperature only, the temperature will not be changed by loss of pressure in the valves and passages, and the air at cut-off will be cooler than in the supply pipe, only on account of the chilling action of the cylinder during the admission, which cannot be energetic when the air is dry, and probably is not very important when the air is saturated.

WHEN zinc is melted with argentiferous lead in order to remove the silver from the lead by the production of a zinc-silver alloy, considerable loss of zinc and silver occurs, owing to the oxidation of the former. In the Rossler—Edelmann process this is avoided by adding ½% aluminum to the melt. The aluminum combines with the oxygen present as oxides of the other metals, and the separation of the fused mass into two layers is more effectual owing to the greater fluidity of the melt. The temperature of the mass before the addition of the aluminum should be 500° C. The alloy of zinc and silver obtained in this way can contain up to 20% of the latter metal. It is cast into anode plates of suitable form, and these are used in an electrolyte of dilute sulphuric acid containing zinc sulphate. The zinc of the anode is dissolved and redeposited at the cathode, while the silver and the small quantity of lead present remain as an insoluble sludge upon the bottom of the vat.

STEAM is superheated to 480° F., and in exceptional cases to 570° F. As used in common practice, steam carries with it more or less water in the form of small globules. Even the best boilers deliver steam containing from 2% to 5% of water. If this saturated steam be heated, superheated steam is formed, which acts after a certain increase in temperature exactly like a perfect gas. If this increase of temperature is carried on under constant pressure, the temperature of the steam rises, and its volume increases. Saturated steam of ninety pounds per square inch of pressure, superheated to 424° F., increases its volume one-third. This increase of volume means a less amount of steam for a certain cut-off. Superheated steam has a high elasticity, and can therefore be carried at a great velocity through the pipes. A velocity of 400 feet is not unusual. Smaller pipes can be used to carry the same amount of steam, and these small pipes give less loss of heat through radiation than larger ones would give.

ANSWERING Colorado, Utah, Idaho and Arizona inquiries as to the 16 to 1 in the Kansas City platform: by the mint act of 1834 every owner of gold bullion and of silver bullion was permitted to take it to the mint and have it coined free of expense, except for refining and for alloy used, at the rate of sixteen times as many dollars for a given weight of gold as for a given weight of silver. While 23.22 grains went to the dollar in gold, 371¼ grains of pure silver were required for a silver dollar. With the alloy added it took 25.8 grains of standard gold for the dollar in gold, and 412½ grains of standard silver for the silver dollar, or about 16 to 1 by weight. The provision of this law as to silver was repealed in 1873. This is what the ratio of 16 to 1 means. A gold dollar weighs 25.8 grains, of which 23.22 grains are pure gold, the remainder being alloy. A silver dollar weighs 412.5 grains, of which nine-tenths, or 371.25 grains are pure silver, the remainder being alloy. Thus the pure silver in a silver dollar weighs about sixteen times as much as the pure gold in a gold dollar, and this is the meaning of "16 to 1." The proposal to adopt the free coinage of silver at a ratio of 16 to 1 is a proposal that any owner of silver bullion shall be authorized by law to take it to a United States mint and have coined and returned to him $1 for each 371.25 grains of silver, this dollar to be legal tender for the payment of all debts, public or private. The silver in such a dollar (and the dollar itself under free coinage) would be worth, at the present price of silver, about 50 cents in gold.

A SIMPLE and rapid way of testing a dynamo to determine whether any changes in the efficiency have occurred after a period of running consists in uncoupling the dynamo from the engine and running it as a motor, current for the purpose being taken from the bus bars or from another machine until its speed of revolution has reached a given value, when the current is broken and at the same instant a stop watch started, and the time which the machine takes in gradually coming to rest noted. A standard may be obtained by making the test when the machine is new or when it is known to be working at its highest efficiency, and then at any other time the dynamo may be tested for comparison with the standard. Such tests will show whether the bearings are in good order or not, whether the brush friction has become abnormal and with the fields excited, and also what the foucalt losses are, for under this condition the armature will come to rest sooner than with the field open, since the foucalt current losses will then be added to the friction losses in bringing it to rest. This method aims only to show the relative efficiency of the dynamo, as it would be necessary to know the moment of inertia of the armature to determine the actual value by such methods.

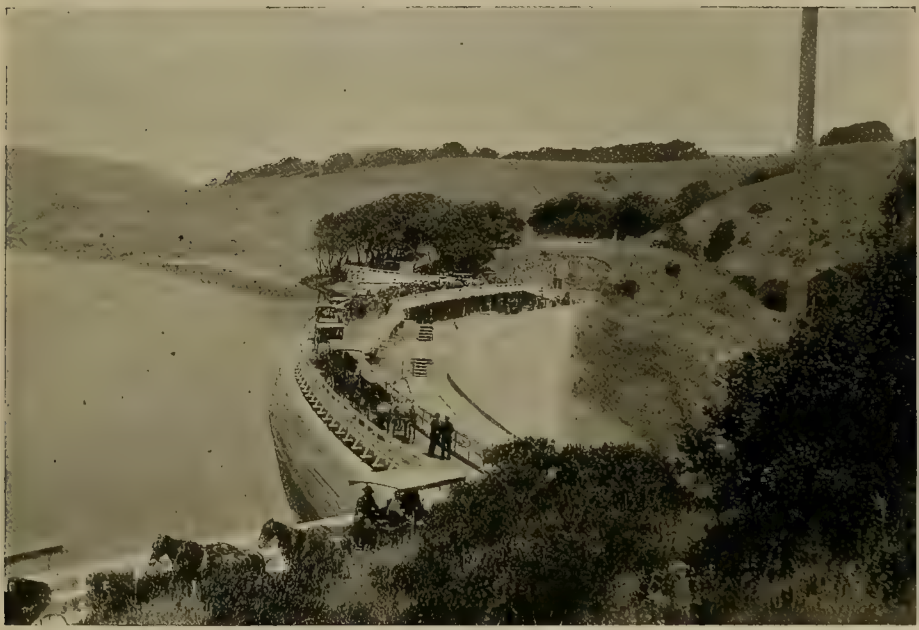
GOLD and silver refining by electrolytic methods is carried on at three works in Europe, two being in Germany and one in Belgium. At Frankfort the Moebius process is used for refining silver on a large scale. This process is also used at St. Louis, at Perth Amboy and at Pittsburg, in the United States. The plant at Frankfort is designed for an output of 35,000 ounces of silver per day of twenty-four hours. A 25 H. P. gas engine drives a dynamo yielding 150 ampères at 100 volts. This current is passed through sixty to seventy cells in series, each requiring about one and one-half volts. The vats are of pine, coated internally with tar; each vat is divided into seven compartments. In these are hung three rows of anode plates and four rows of cathode plates. The former are plates of bullion .40 inch thick, each weighing 3.3 pounds. The latter are thin sheets of rolled silver. The anodes are enclosed in linen bags. The electrolyte consists of a copper nitrate solution, containing one-eighth of silver, and during the electrolysis it is kept slightly acid by addition of nitric acid. To prevent short-circuiting the crystals of silver are continuously removed from the sheet silver cathodes and are allowed to collect upon a canvas tray suspended beneath the electrodes. They are withdrawn, washed, dried and fused at intervals to obtain ingots of fine silver.

THE rotary booster is a machine consisting of two dynamo electric machines, one of which is a motor which may be either alternating or direct current, directly coupled or belted to a generator either alternating or direct current or arc. This machine is for use on long-distance feeders in railway and central station work. The generator end of the machine is series wound, and through it passes all the current which goes through the feeder to which it is attached. It is a low voltage machine and increases the voltage on the feeder to which it is attached a sufficient amount to enable current to be delivered at the end of a long feeder at the same pressure that it is delivered at the ends of shorter feeders connected with the system. It is a device to save copper; but when it is used, the line loss is increased, though, under conditions where for short periods of the day the load is heavy, it pays to do this instead of adding the requisite amount of copper. It is used in stations operating storage batteries for increasing the potential when charging. The efficiency of such a machine is from 80% to 85%. A static booster is practically a transformer and is intended to be upon the long feeders of alternating systems. It performs the same function that the rotary booster does, by raising the pressure of the long feeder to a higher potential, so as to make the current delivered of the proper potential. It has an efficiency of 90% to 97%.

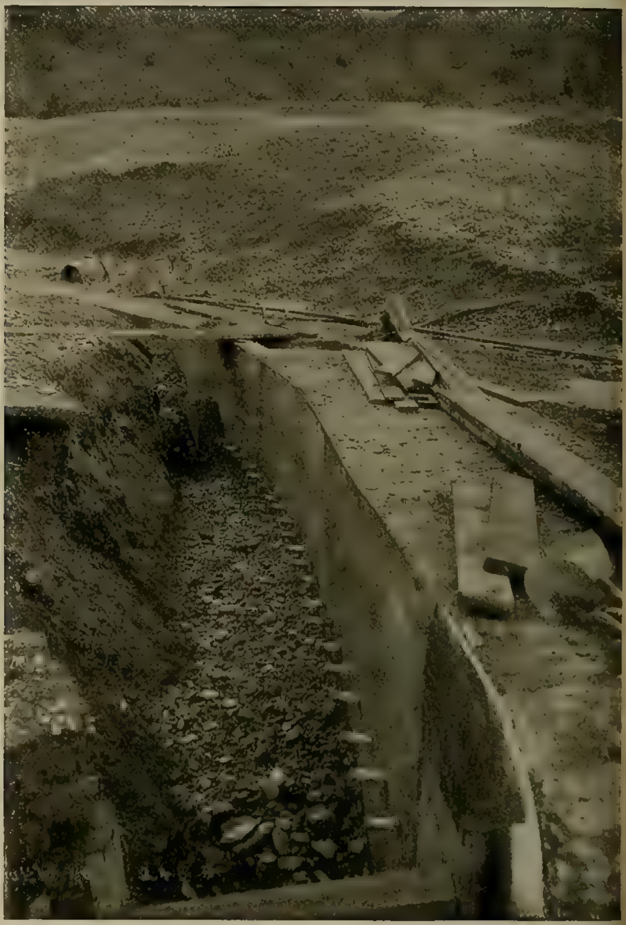
AN adverse mining claim must be filed with the register and receiver of the land office where the application for patent was filed, or with the register and receiver of the district in which the claim is situated at the time of filing the adverse claim. It must be on the oath of the adverse claimant, or it may be verified by the oath of any duly authorized agent or attorney in fact of the adverse claimant cognizant of the facts stated. Where an agent or attorney in fact verifies the adverse claim, he must distinctly swear that he is such agent or attorney, and accompany his affidavit by proof thereof. The agent or attorney in fact must take the affidavit in verification of the adverse claim within the land district where the claim is situated. The adverse notice must fully set forth the nature and extent of the interference or conflict; whether the adverse party claims as a purchaser for valuable consideration or as a locator; if the former, a certified copy of the original location, the original conveyance, a duly certified copy thereof, or an abstract of title from the office of the proper recorder should be furnished, or, if the transaction was merely a verbal one, he will narrate the circumstances attending purchase, the date thereof, and the amount paid, which facts should be supported by the affidavit of one or more witnesses, if any were present at the time, and if he claims as a locator he must file a duly certified copy of the location from the office of the proper recorder.

San Francisco's Water Supply.

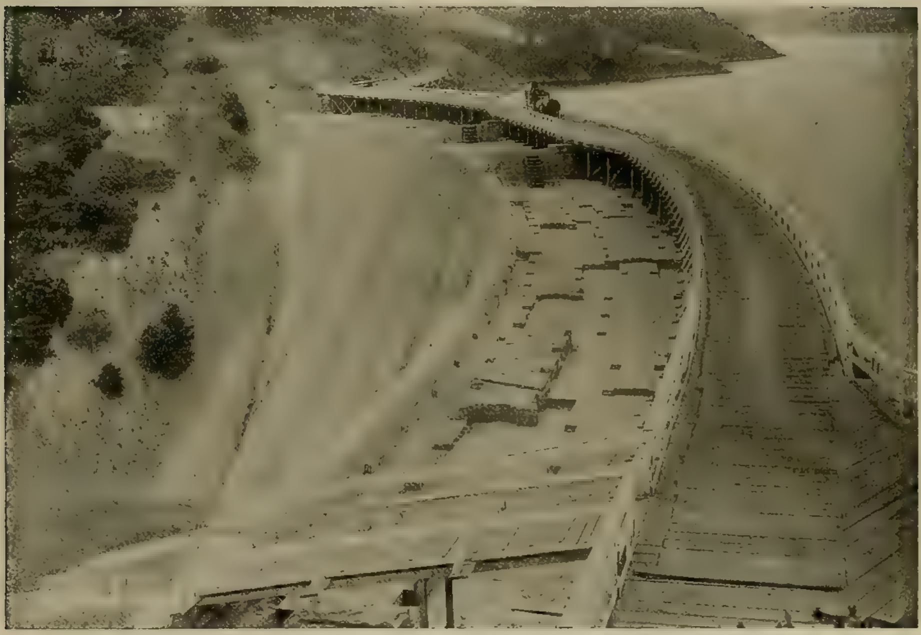
The city of San Francisco, Cal., daily consumes 30,000,000 gallons of water, or about eighty-six gallons per day for each inhabitant. When the early Spanish authorities were sent to select a site for a city on the bay of San Francisco they rejected the peninsula on which San Francisco is now built, as it lacked water, or facilities for securing adequate supply. From the days when water was taken from wells, hauled about the streets and distributed for twenty-five cents a bucket, to the present system of supply there is a long record of effort to furnish good water in sufficient quantity at a low price. The effort has been successful, and at an estimated cost of $30,-



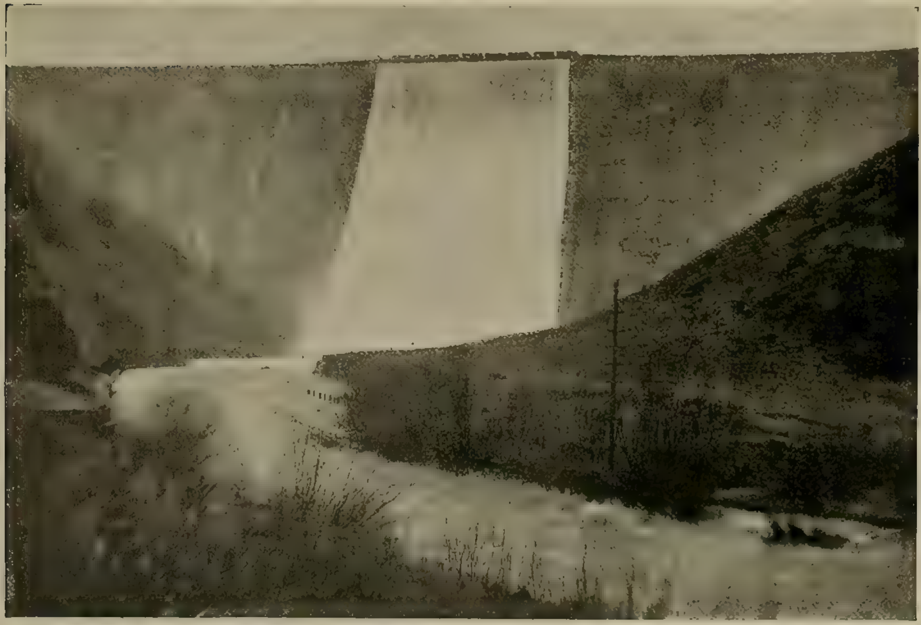
THE CRYSTAL SPRINGS DAM.



SHOWING FILTER PIPES, SUBTERRANEAN AQUEDUCTS AND GRAVEL FILTER IN PREPARATION.



THE TOP OF CRYSTAL SPRINGS DAM—SHOWING THE METHOD OF BLOCKING.



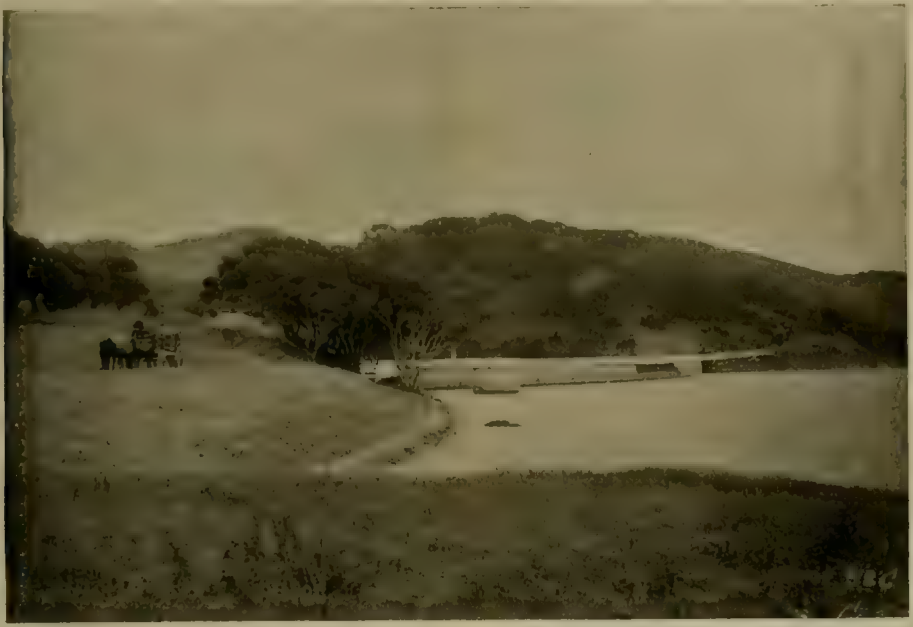
THE CRYSTAL SPRINGS DAM—SHOWING OVERFLOW.

SUBTERRANEAN WATER DEVELOPED AT SUNOL.

000,000 San Francisco has water abundant and pure at a fair figure, the result of half a century of engineering effort.

There was not anywhere on the peninsula sufficient natural storage capacity for a city of 25,000 people, and to accommodate the city of 1900, with its 370,000 inhabitants, an elaborate and complex system of artificial supply and storage reservoirs has been constructed.

The engineers of the Spring Valley Water Co., which corporation supplies San Francisco with wholesome water, figure that they now have sufficient resources to supply more than a million people.

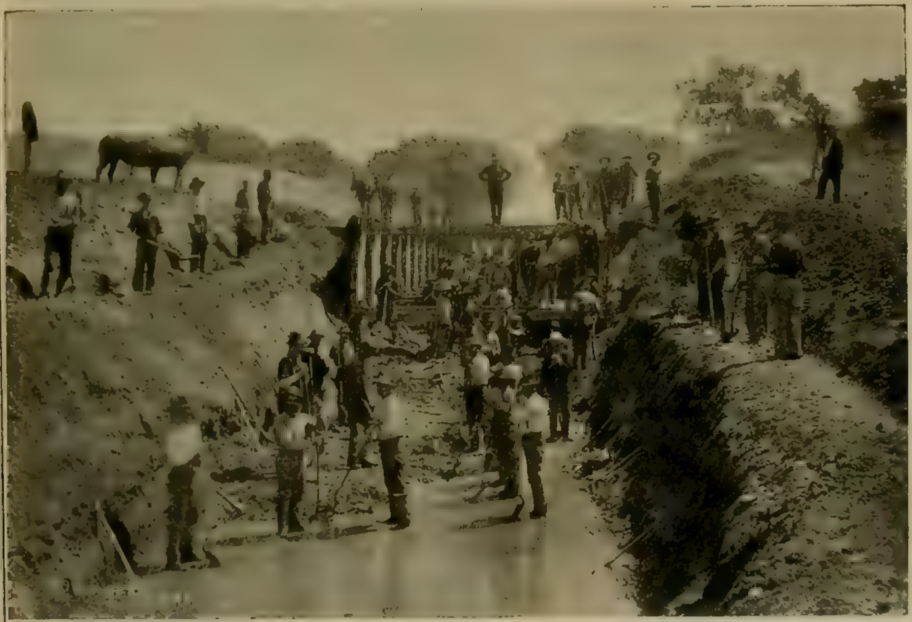


THE CRYSTAL SPRINGS DAM—AS SEEN FROM THE LAKE.

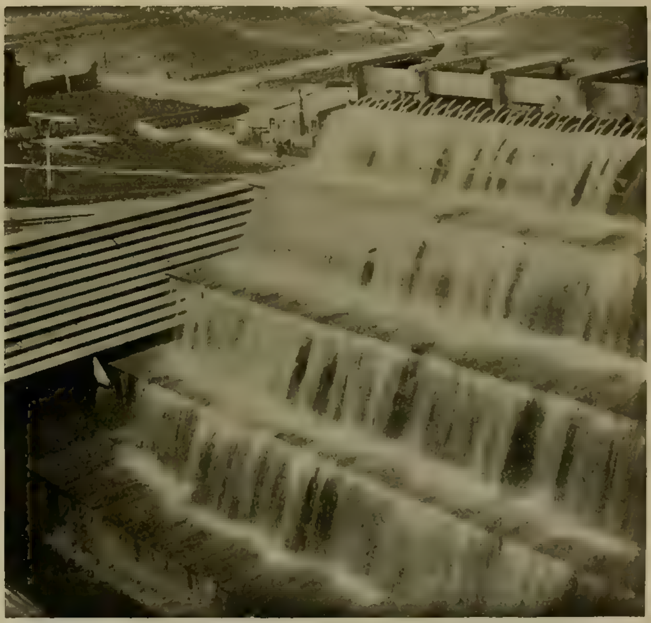
The conditions are peculiar. In San Francisco it may rain a little between the months of November and May. It is not at all likely to rain between May and November. During the six months specified 22 inches of rain may fall. This with six months' annual absence of rainfall, and with occasionally only 10 inches of rainfall in the time when rain is likely to fall at all, with no natural reservoirs, and in a hilly city, surrounded on all sides by deep salt water, the problem of water supply afforded unusual difficulty.

The city of San Francisco is built on a peninsula pushed northward from an outlying spur of the coast range, the area about that of Manhattan island, on which New York city is built, the contour varying from sea level to a height of 900 feet. It is a city of hills and valleys, like the country to the southward. In the adjacent country, about 25 miles south of the Golden Gate, artificial lakes and storage reservoirs have been created and are maintained, from which water is piped to distributing reservoirs in the city having an aggregate capacity of about 200,000,000 gallons. From these reservoirs the water flows by gravity at a pressure of from thirty-five to seventy-five pounds per square inch at the hydrants, of which scattered throughout the city are nearly 4000. There are about 375 miles of water pipe.

Among the reservoirs Crystal Springs lake deserves especial notice. It is in San Mateo county, 23 miles from San Francisco, and is the largest of the reservoirs. It is at an elevation of 350 feet, is formed by a great concrete dam, which impounds about 28,000,000,000 gallons. Herewith are illustrated some of the details of the Crystal Springs reservoir, the building of which is conceded by engineers to embody some of the best and safest principles of dam construction. It is believed to be the largest concrete dam in the world, and the highest dam in the United States. It is noted no less for its magnitude than for the originality of much of its construction. The dam is 145 feet high and is to be raised to the height of 170 feet. It is 176 feet thick at the base; at its summit it is 700 feet long, 40 feet thick; its front slope is 1 foot horizontal to 4 feet vertical; the rear slope begins 1 foot vertical to 1 horizontal, and ends in the upper 60 feet with a 2-foot slope vertical to 1 foot horizontal, the two rear slopes connected by a curve of 298 feet radius; the convex side of the dam facing upstream being curved with a radius of 637 feet.

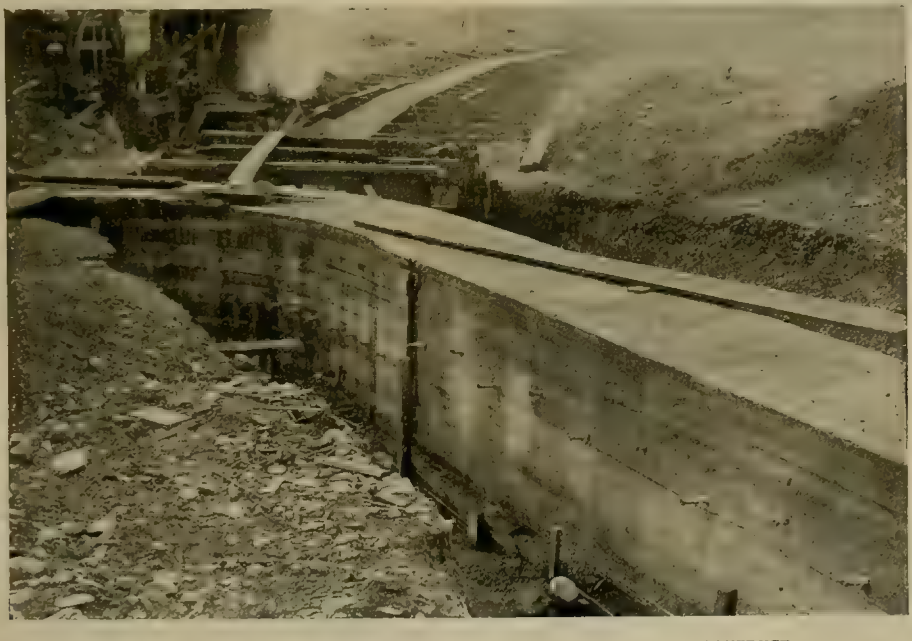


OPENING CUT FOR SUBTERRANEAN FILTER AQUEDUCT.



SHOWING DETAILS OF AERATOR AT COLLEGE HILL RESERVOIR.

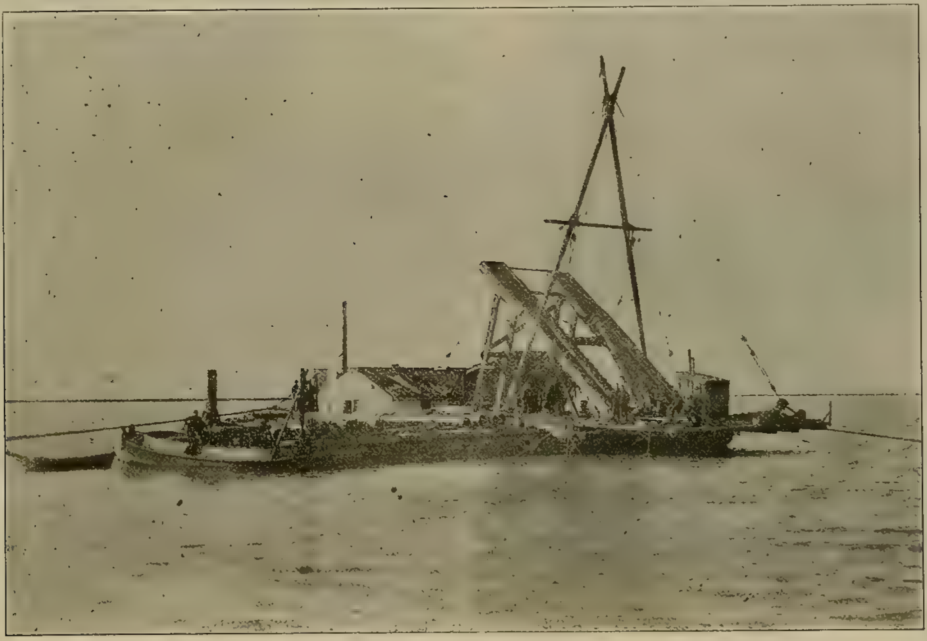
In building the dam the site for the foundation was cut down from the surface for a depth of from 10 to 40 feet. No explosives were used, lest the bedrock be cracked. The bottom being ready, blocks of concrete were made, each 40x30x8 feet, and when ready were laid and dovetailed, as shown in the illustration. About 5000 of these blocks of varying size were thus used, no two blocks being of just the same shape or dimensions. Thus this dam is not a homogeneous mass of concrete, but is built of interlocking blocks, thus providing an elasticity that aids in withstanding the pressure of the artificial lake, nearly 9 miles in length, it creates—a pressure estimated to be 130,000 tons against its face. The concrete used was in the proportion of two pounds specially prepared sand to one of cement and six barrels of rock. In the construction were consumed 1,230,000 barrels of rock, 410,000 barrels sand and 205,000 barrels Portland cement. The dam was built far into the solid rock on each side of the canyon, to insure greater security.



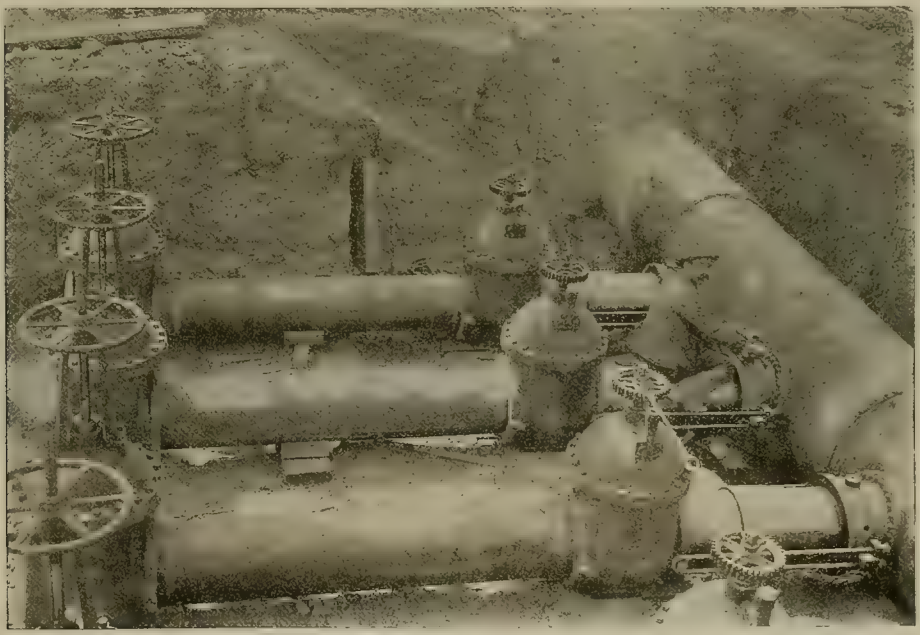
SHOWING THE FILTER PIPES IN THE CONCRETE, SUBTERRANEAN AQUEDUCT.

Portola lake, 26 miles from San Francisco, near Menlo Park; Lake Merced, a natural reservoir, within the city limits; San Andreas and Calaveras reservoirs, are among other sources of San Francisco's water supply as arranged by the Spring Valley Water Co., besides a unique development of subterranean supply across the bay, near Sunol. This last deserves especial mention, being a natural subterranean lake, fed by hundreds of square miles of watershed, successfully tapped and piped to supply the city, filtered as it flows, and further aerated before use.

The water from the San Andreas reservoir flows under a 340-foot pressure, through a 30-inch pipe, 16 miles, and at the College Hill reservoir is subjected to such aeration as in the judgment of bacteriologists gives it the minimum of bacteria.



LAYING SUBMARINE PIPES ACROSS THE BAY OF SAN FRANCISCO, FROM DUMBARTON POINT TO RAVENSWOOD.



SHOWING THE CONNECTION OF MILLBRAE PUMPS WITH THE 44-INCH CRYSTAL SPRINGS MAIN.

The accompanying engravings give a good idea of the system which abundantly supplies the chief city of the Pacific coast with wholesome water.

A NEW METHOD of making joints in heavy wires and cables is explained as follows: Sleeves of soft copper, long enough to receive the two cable ends for a distance of about twice their diameter, are provided, the walls of the sleeves being sufficiently thick so that the sleeve contains as much metal to the running inch as the cable, or more. The two ends are butted in the sleeve, and the jaws of a hydraulic press of considerable power, but light weight and small size, are set on the joint. One squeeze at a pressure of about forty tons to the square inch welds the sleeve and the cable into a solid mass, so that if the joint is sawed apart it is impossible to tell where the metal of the sleeve ends and that of the cable begins.

OIL WELLS, says the Bakersfield Californian, are drilled, not bored nor sunk. Water wells are bored, fortunes are sunk. An oil well is dry or a duster if it contains no oil, even though it discharges a river of water.

Carborundum Manufacture.

In the issue of Jan. 4, 1896, was given an illustrated technical account of the manufacture of carborundum at Niagara Falls, N. Y., the photographs having been taken specially for the article, which was written by one of our correspondents who had special access to reliable information concerning the details of that new industry.

Like other commercially scientific subjects, the carborundum industry is a progressive one, and some of what in 1896 was up-to-date is in 1900 becoming obsolescent. When the article referred to was written, the crude materials for the manufacture of carborundum at Niagara Falls were sand, coke, sawdust and salt. These were ready for use except the coke, which had to be ground to a fine powder. The furnaces were built of brick and had the form of an oblong box about 16 feet in length and 5 feet in width and depth. In the center of either end were the terminals, consisting of sixty carbon rods 30 inches long and 3 inches in diameter. The mixture was thrown into the furnace, connection made with the dynamo, and after twenty-four hours the process was complete. The carborundum occurred in the center of the mixture as bright, radiating crystals. In order to prepare the carborundum for the market, it was first placed under heavy iron rolls for the purpose of crushing apart and separating the individual crystals, which were then washed in a solution of acid and water to remove solubles, and finally dried and sifted to separate the different-sized crystals. During the year 1896 the Carborundum Company produced in round numbers 1,191,000 pounds of crystalline carborundum, used chiefly as an abrasive, for which it is well suited, owing to its excessive hardness.

The first manufacture of carborundum for commercial uses was on so small a scale as to make it practically a laboratory product. The carborundum so produced was at such a high cost that its commercial usage was restricted to very limited lines. The first sales of carborundum were made to lapidaries, to be used in the place of diamond powder, and the price ranged from $400 to $600 per pound. This was in 1892. Later in the same year the scale of manufacture was so increased that an average of one-quarter of a pound per day was produced, and as this amount was found to be in excess of the capacity of the lapidaries to absorb, attempts were made to introduce the use of carborundum into other lines, and considerable quantities were sold to brass manufacturers for valve grinding at prices which varied from $15 per pound down to $2 per pound in 1893.

In 1894 the Carborundum Company commenced the manufacture of carborundum on a really commercial scale by the use of an electrical current of 150 H. P., which gave a production of 100,000 pounds of carborundum per year; in 1895 the company built its factory at Niagara Falls, and in 1896 commenced the use of 1000 electrical H. P. In 1899 this was increased to 2000 H. P.; the production of carborundum for that year amounted to 1,742,000 pounds. On Jan. 1, 1900, the company had in operation fourteen furnaces.

The scale and the character of the sale of carborundum has changed from a measurement by the carat at $600 per pound in 1892 to the measurement by the carload at 10 cents per pound in 1899. The total sales of carborundum in 1899 amounted to 2,018,000 pounds.

The illustrations on the front page show the latest progress that has been made in the carborundum manufacture, and comparison of them with those published in January, 1896, would exemplify the ratio of progress.

Besides the varied commercial uses of carborundum it is now becoming of interest to metallurgists in other fields, notably in its substitution for ferrosilicon in steel manufacture. The composition of ferro-silicon averages 15% silicon; commercial carbide of silicon averages 62%. The carbide of silicon is in the form of grains or powder, and, on account of its chemical nature, is readily taken up by the molten steel, so that in actual practice it is now customary to merely put the necessary amount of the carbide into paper bags and throw the latter into the ladle, which is then filled with the molten steel. The object of adding silicon to steel is to increase the fluidity of the metal while in the molten state, this being occasioned by the increased temperature produced. In the use of ferro-silicon a certain proportion of heat becomes latent or is absorbed in effecting its decomposition when added to steel: this meaning so much heat lost. Carbide of silicon is an endothermic compound, giving out heat during decomposition.

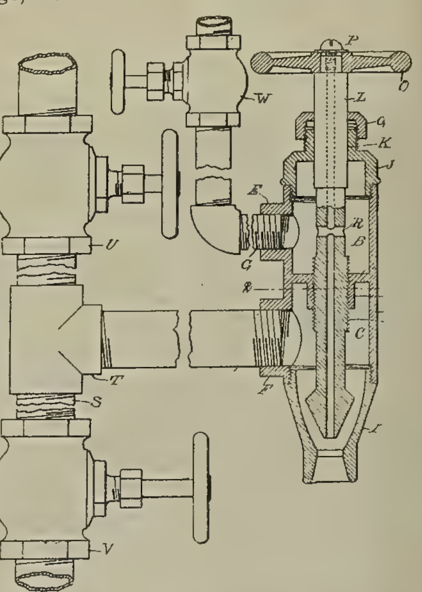
So far as known, carborundum does not occur in nature, probably because the temperatures of formation and decomposition lie so close together. Carborundum is insoluble in water or any acid; it approximates the diamond in hardness, and is fast coming into general use as an abrasive.

Mining and Metallurgical Patents.

Patents Issued August 14, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

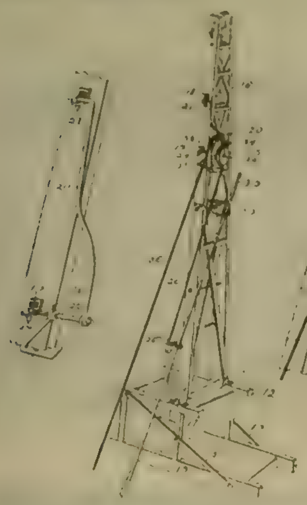
HYDROCARBON BURNER.—No. 655,942; B. F. Weber, Chicago, Ill.



In an oil burner, combination with cylindrical casing divided between its ends into two compartments adapted to be connected respectively with oil supply and fluid pressure supply, fluid pressure chamber terminating at one end in mouth contracted between its end, of valve stem passing centrally through both compartments and provided at one end with an enlarged conical head serving as valve to control supply of fluid under pressure and seating against contracted portion of mouth, central opening in valve stem extending centrally through head, and lateral openings in valve stem adapted to connect central opening therein with oil receiving compartment of casing.

◆

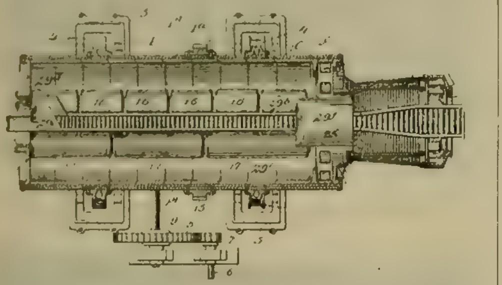
DERRICK ATTACHMENT FOR HANDLING DRILL ROD SECTIONS OF WELL AUGERS.—No. 655,743; W. L. Thomas, Fontanelle, Iowa.



In a derrick attachment for handling drill-rod sections, a shaft for pulleys having right-angled extension at one end adapted to enter fixed perforated ear, hanger having shaft bearing at lower end and hook-shaped trunnion at other end, rope or rope guide extending at right angles from shaft, two pulleys mounted on shaft to rotate jointly, rope fixed to each pulley and perforated ears fixed to derrick for pivotally connecting shaft and hanger with derrick.

◆

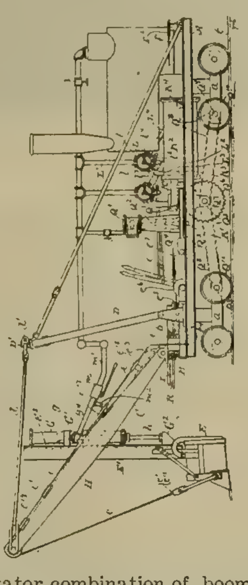
CYLINDRICAL ROLLER CRUSHER. — No. 655,745; T. O. Walker, Denver, Colo.



Combination of rotable cylinder provided with heads having central openings, series of crushing rollers in cylinder, cylindrical screen attached to discharge end of cylinder, series of buckets between baffle ring and discharge end of cylinder, series of buckets at other ends of the screens, trough extending through cylinder and screen, spout near feed end of cylinder, pan above trough adapted to receive material discharged from buckets between baffle ring and discharge end of cylinder, and means to reciprocate trough and pan.

◆

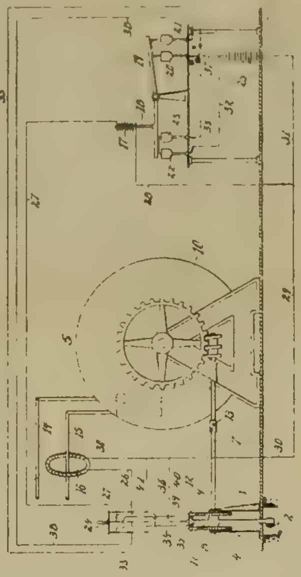
EXCAVATOR.—No. 655,758; A. E. Cheney, G. A. Cheney and G. W. King, Marion, O., assignors to Marion Steam Shovel Co., same place.



In an excavator combination of boom, excavating shovel, cylinder, suitably actuated piston within cylinder, piston rod, four parallel sheaves e^{5}, e^{7}, e^{9} and e^{11} supported from piston rod, equalizing sheave e^{8} supported an equal or approximately equal distance from both outer piston sheaves, two guide sheaves e^{6} e^{10} supported an equal distance, or approximately equal distance, from different inner piston sheaves, respectively, and continuous hoisting cable having its opposite ends operatively connected with excavating shovel, and leading from each end and being suitably guided along boom and thence leading to and engaging all of the sheaves in the manner shown.

◆

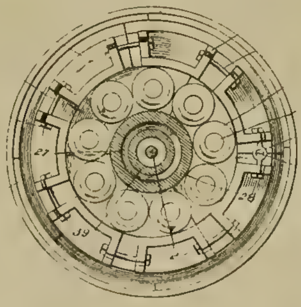
ELECTRIC FURNACE.—No. 655,780; W. S. Horry, New York, N. Y., assignor to the Union Carbide Co., Chicago, Ill.



Means for regulating one or more electric furnaces which comprise motor apparatus, furnaces and their movable elements, power transmission mechanism for independently connecting movable element of each furnace with motor apparatus to shift it in either direction and for disconnecting same, electro-mechanical controlling devices in operative position to the furnace circuits adapted to automatically actuate power transmission mechanism to keep amperes constant in furnaces, and switches constructed and arranged to control power transmission by hand, to shift regulating elements in either direction, and to permit and prevent control by electro-mechanical devices.

◆

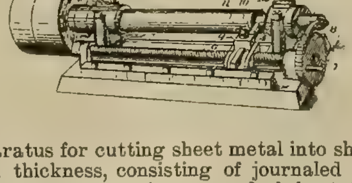
QUARTZ MILL.—No. 656,793; A. T. McMurtrey, Medford, Or.



Quartz mill combination with pan of mullers, consisting of sections of flat ring, provided with inner and end flanges, latter having opposite notches, of double-headed bolts dropped into notches to couple mullers loosely together, vertical shaft, yoke carried thereby, knees secured to arms of yoke, cap or driving ring secured on knees, and coupling pin passed downward through cap and into eye in one of the muller coupling bolts.

◆

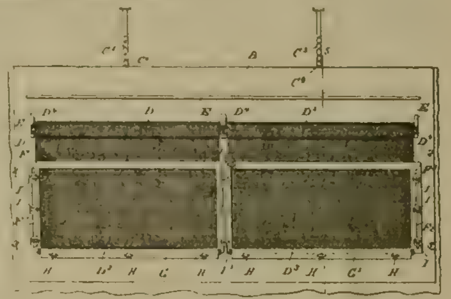
APPARATUS FOR CUTTING METAL SHAVINGS.—No. 655,868; A. Holtgen, San Francisco, Cal., assignor of one-half to W. E. Hampton, same place.



Apparatus for cutting sheet metal into shavings of uniform thickness, consisting of journaled revoluble arbor, means for securing one end of sheet to arbor, sheet being coiled upon itself and outer edge fastened, screw journaled and revoluble parallel with arbor having ratchet wheel upon outer end, pawl mounted upon pin fixed eccentrically in end of arbor whereby pawl is moved to advance ratchet wheel at each revolution of arbor, tool holder consisting of lower slidably guided plain portion, an upper portion hinged thereto having screw threads engaging those of screw when closed, upper section being adapted to receive tool, with means for adjusting and locking latter thereto.

◆

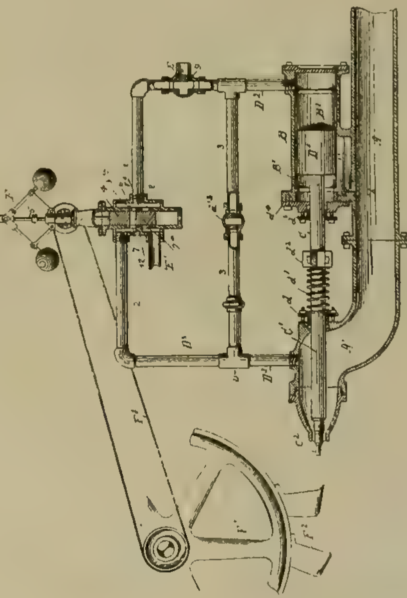
SCREEN FOR STAMP MILLS.—No. 656,098; M. R. Driscoll, Frisco, Utah.



Screen for stamp mills, comprising an apertured frame, roll of screen cloth mounted above aperture and having portion of cloth extending over aperture, being adjustable to bring roll in firm contact with front face of apertured frame, rectangular clamping frame for clamping cloth to sides, top and bottom of aperture, bolts for adjustably holding clamping frame in place on apertured frame and auxiliary clamping bar on apertured frame for clamping lower end of cloth upon front face of bottom bar for rectangular clamping frame; a combination with apertured skeleton frame on front of stamp mill or mortar, of plurality of clamping frames for screen, to hold latter in front of skeleton-frame openings, clamping bolts for engaging side bars of frames, bolts for adjacent side bars simultaneously engaging latter and clamping bolt on skeleton frame, adapted to engage either clamping frame.

◆

REGULATING MEANS FOR HYDRAULIC MOTORS.—No. 656,104; J. D. Fricot, San Francisco, Cal.



Combination of motor, water-supply pipe therefor, cylinder communicating with supply pipe, piston in cylinder, controlling device for supply pipe, connected to piston, pipe connection between supply pipe and cylinder, valve casing interposed in pipe connection, valve in valve casing, mechanism for operating valve in accordance with speed of motor, valve-controlled discharge for pipe connections and intermediate pipe connection constituting by-pass around valve and stop-cock in by-pass; combination, with main pipe having nozzle, of cylinder parallel with main pipe and means for controlling admission and exhaustion of fluid to and from auxiliary chamber.

◆

BLASTING POWDER.—No. 655,832; J. Ross and W. D. Cairney, Glasgow, Scotland.

Method of producing an explosive which consists in taking a proportion of chlorate of potash, passing same through a sieve to granulate it, mixing granulated chlorate of potash with proportion of charcoal and black oxide of manganese, taking proportion of wax and mixing it with mixture of chlorate of potash, charcoal and black oxide of manganese until wax becomes perfectly black, placing whole in vessel, heating vessel with its contents until contents become moist with melted wax, taking proportion of vaseline and bringing it to liquid state, pouring liquid vaseline over mixture and thoroughly stirring whole mixture together for filling crevices in substance to which paraffine is inaccessible, and providing coating on substance which paraffine has failed to coat. An explosive consisting of mixture in the following proportions of ingredients: Chlorate of potash, 75%; black oxide of manganese, 6%; charcoal, 6%; wax, 9%; vaseline, 4%.

The Copper Queen Mine, Arizona.*

Edward Keller, Baltimore, Md., in a communication to the secretary, says: When, at the New York meeting, February, 1899, Mr. Douglas gave an abstract of his highly interesting paper on the Copper Queen mine, he invited the members of the Institute, in his usual progressive spirit, to make a full scientific investigation of the region of that mine during the prospective excursion to Bisbee, Arizona. I volunteered to examine some of the metallurgical processes and products of the works, and obtained from Mr. Douglas a valuable series of samples. Upon the issue of his paper, however, I found that he had already a considerable volume of analyses of those products, and that little was left for me to do in that respect, except to duplicate his results, the importance of which work would not have been commensurate to the time and labor involved. I selected, therefore, only some points which he had not made entirely clear, or concerning which I was skeptical. The details of most of my work will appear in a future paper.

From Mr. Douglas' figures I have calculated the values for the elimination of impurities in the so-called Leghorn converter, introduced by him at the Copper Queen works, and have found them to be as follows:

PERCENTAGE OF ELIMINATION OF IMPURITIES IN FOUR BLOWS OF A CONVERTER.

Number of blow.	Sulphur..	Iron......	Zinc......	Nickel....	Lead.....	Antimony	Arsenic ..	Selenium, Tellurium
1.....	99.4	99.6	88.0	92.6	94.4	81.6	83.8	40.3
2.....	99.0	99.6	98.1	92.5	96.9	71.9	76.6	38.1
3.....	98.8	99.5	93.5	91.4	96.3	63.8	80.6	25.3
4.....	99.8	99.5	95.8	95.8	97.5	65.3	76.9	36.3

Those elements for which I have determined the elimination in other converters, and which also appear in the above table, are lead, antimony, arsenic, selenium and tellurium. Mr. Douglas' results as to these show no new feature; they closely corroborate my own, as given in a former paper.† Selenium and tellurium, in Mr. Douglas' case, as well as in my own heretofore, were determined jointly. As the Copper Queen mattes contain a greater amount of both elements than the mattes which I had previously analyzed, I now took occasion to separate the two, and found the elimination of selenium to be somewhat greater than that of tellurium. To sulphur, iron and zinc I paid no attention in my former publications, because I always considered them as members of a group of elements of which 99% or more is eliminated in the converter. In fact, I have been unable to find zinc in the copper of the Copper Queen or in any other converter copper.

Mr. Douglas gives to nickel as high a figure for elimination as to zinc. Since zinc is a far more oxidizable and volatile metal than nickel, I thought there was good reason to doubt the correctness of this conclusion. In the course of analysis, unless a separation of nickel and cobalt be attempted, the two elements would naturally be determined together. In the Copper Queen mattes I found that, of the sum of the two metals, from one-fourth to one-half is cobalt; and as the latter (being practically all eliminated in the converter process) could not be found in the copper, I found the elimination of nickel to be much below Mr. Douglas' figure. The cobalt, on the other hand, must now be placed in the same category as sulphur, iron and zinc.

I subjoin an analysis of a Copper Queen matte as being, perhaps, of some mineralogical interest. The figures are not derived from one sample, but culled from half a dozen:

COMPOSITION OF COPPER QUEEN MATTE.

	Cu.	S.	Fe.	Zn.	Co.	Ni.
Per cent.....	54.98	23.36	30.25	0.34	0.024	0.0341
	Pb.	Bi.	Sb.	As.	Se.	Te.
Per cent.....	0.1178	0.0044	0.0232	0.0171	0.0113	0.0088
	Ag.	Au.				
Ozs. per ton..	6.0	0.10				

As compared with the mattes of Butte City, Mont. (see my paper already referred to), it will be seen that the Arizona matte is lower in gold, silver and bismuth, but higher in selenium and tellurium. This I mention because it is my impression that all these elements are generally supposed to be associated.

On mathematical grounds one might expect that with increase in the capacity of a converter there would be an increased economy in the wear of the converter lining, the surface of the matte in contact with the lining increasing at a "square" rate, while the mass of the same matte increases at a "cubic" rate. In the case of Mr. Douglas' slags their acidity, in fact, decreases in each succeeding blow, as will be seen by his figures:

ACIDITY OF CONVERTER SLAGS.

	First pouring, per cent silica.	Second pouring, per cent silica.
First blow...........	36.78	34.64
Second blow	35.30	33.46
Third blow..........	34.35	32.60
Fourth blow........	32.57	

Mr. Douglas does not give the weight of the matte charged or of the copper produced. Only the number of copper bars are given, as follows:

	First blow.	Second blow.	Third blow.	Fourth blow.
Number bars...	9.5	14.5	14.5	12

It may be assumed that the weight of matte or copper was proportional to the number of copper bars, in which case there was no regular increase in the capacity of the converter. The mathematical theory, therefore, does not apply in this case. Perhaps the real reason for the reduced acidity of the slags in successive blows is found merely in the physical condition of the lining, which may have become more and more compact by continued heating.

The Anaconda Converter.

When approaching Anaconda by the B., A. & P. Railroad, almost the first object in connection with the reduction works to attract the eye is a huge pyramidal pile just below the converter. It is nearly black in color, and extending up the elongated western slope is what appears to be a railroad track. Investigation discloses the fact that this conspicuous object is composed of granulated slag from the blast furnaces of the converter. This slag is drawn off from the furnaces in a molten state. It is run into a sluice carrying a strong stream of water, which cools and granulates it. Passing down the surface a couple of hundred feet, it is deposited into two large receiving tanks. These tanks are elevated on piling, so that small cars or skips can pass under them. In the bottom of the tanks are doors through which the cars are loaded, and then by means of a stationary engine they are hauled to the top of the pile referred to and dumped. Inquiry at the converter will bring out the fact that this huge pile has all been formed within the last five or six months. When it is considered that it has all come from the six blast furnaces, and constitutes but a small fraction of the ore treated at these works, it is faintly suggestive of the magnitude of their operations, and also of the tremendous quantities of ore that are taken from the Anaconda mines at Butte. This method of disposing of the slag from the blast furnaces is made necessary by the nature of the ground, the fall not being sufficient to carry it away by mere gravity.

The converter is always a busy place, as may readily be imagined from the fact that it turns out an average of about 12,000,000 pounds of metallic copper each month. This is partly in the form of pig copper, which is sent East for refining, and partly in anode plates, which go to the refinery here.

The regular work of converting has been broken in upon during the last few days by the cleaning of the flues. About once in two months this is done. The quantity of flue dust saved is large, and very high in copper, that from the converters running from 20% to 50%.

An improvement just made of some importance is in the method of lining the converters. For this purpose the material heretofore used was ground silica, reduced to the consistency of thick mud, the work of lining being done entirely by hand. By the new method, slimes from the concentrators are used, and these are tamped into the converters by tamping machines. A small quantity of silica is mixed with the slimes to give them consistency and aid in the tamping process. A square pit has been prepared at the west end of the converter, equipped with three of these tamping machines, which are run by compressed air. Into this pit the converters are lowered by the electric crane and placed under the tamper. Being thus placed, it is connected with shafting whereby it is turned slowly round and round, each revolution bringing in the entire circle under the tamping bar.

There are two primary objects in lining the converters. One is to preserve them from the effects of the intense heat, and the second is to furnish an increased quantity of oxygen to keep alive and strengthen the combustion. Silica has heretofore been used, because it consists largely of oxygen; but the slimes also are composed to a large extent of that same gas, and hence will serve the same purpose. Besides this, the slimes contain a certain percentage of copper and other values, the most of which are saved by the process of converting. This is literally killing two birds with one stone. It is said that about 125 tons of slimes are used each day for this purpose, and the quantity of copper thus saved is an item well worth considering.

It is very evident that in the onward march of improvement at the works the converter is not to be left out of the line of march.—Anaconda, Mont., Standard.

On Baranof Island, Alaska.

H. C. Langrehr of San Francisco and N. K. Foster of Oakland, Cal., have returned from Baranof island, Alaska, where they located twenty-one mining claims between Yule bay and Fersting bay, 22 miles from Sitka. The accompanying illustrations from special photographs furnish idea of the character of the region, which is heavily timbered, the coast accessible to deep-water vessels, the hills ribbed with quartz, slate and schist, carrying low-grade gold ore which the locators propose developing, a 4800-foot tunnel being among their projects.

◆

THE operation of cutting down an elm tree over 3 feet in diameter at Jacksonville, Ill., by means of wires heated by electricity, was successful, though slow. The cautery device consisted of a piece of 7-strand No. 16 iron wire connected with an electric light circuit, three of the strands being removed to afford air space within the cable. The current used was from 120 to 135 amperes, the voltage at the machine being varied from 80 to 115. After the wire became heated it was pulled back and forth like a crosscut saw, and in this manner it burned its way through the tree, the time consumed being two hours and ten minutes.—Western Electrician.

Uranium and Its Ores.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

The metal uranium, discovered in 1782 by the chemist Klaproth and named by him thus from the planet Uranus, has a steel-gray color and a specific gravity of 18.7, approaching closely that of gold, which is 19.3. Like many of the rarer metals its isolation in the chemically pure condition is combined with considerable difficulty, so that its utilization as such has not reached any degree of prominence. It is mainly for this reason that the tendency of modern engineering leans toward the production of alloys of the rare metals instead of the metals themselves, a circumstance which has led to the development of a peculiar industry aiming at the manufacture of a great number of metallic alloys, among which the undetermined compounds of uranium and steel play a significant role. Especially in France, the beneficial effect produced by the addition of a small percentage of uranium carbide to steel has been realized, so that an extended manufacture of war material from that alloy has sprung up there in the last two years. It seems that a compound of this kind surpasses any other product obtained by mixing and incorporating ferro or carbon alloys with fluid steel, as it increases the tensile strength, toughness and elongation of that substance remarkably. Hence the demand for uranium ores has materially increased in later years.

The application of uranium derivatives, is, however, not limited to this industry alone, but extends into several other branches of manufacture. Thus two of the uranium oxides U_2O_5 and U_3O_8, the latter corresponding in composition to the compound occurring in nature as the ore pitchblende, are prized as a means for producing a pure intense black glaze on porcelain. A hydrated sodium uranate, known in trade as uranium yellow, and a hydrated ammonium uranate, serve for the manufacture of a brilliantly fluorescent uranium glass, possessing the peculiar property of arresting chemically active rays, and also as permanent colors in the decoration of glass and chinaware.

The first of these oxides is best prepared by strongly igniting uranium nitrate, when a black powder results, which may be utilized immediately after cooling. The second compound remains on heating the black oxide at a moderate heat in air or oxygen, but is generally produced by igniting uranium nitrate or ammonium uranate at a gentle heat, not sufficient to reduce it to the lower oxide U_2O_5. Finally a sodium salt is obtained by adding an excess of sodium hydrate to the solution of a uranium salt, but preferably by fusing uranic oxide with sodium carbonate. On the large scale, a mixture of 100 parts of pitchblende, containing about 45% of U_3O_8, and 14 parts of lime is roasted in a reverberatory furnace, the calcium uranate formed decomposed by the addition of dilute sulphuric acid, and the solution of uranic sulphate thus obtained mixed with an excess of sodium carbonate, whereby the metals present are precipitated, while the uranium enters into solution. After boiling and filtering, the clear filtrate is just neutralized with dilute sulphuric acid and heated, when a finely divided sodium uranate of the formula $Na_2U_2 .6H_2O$ separates out. The ammonium uranate, on the other hand, is obtained by adding ammonium chloride or sulphate to a boiling solution of sodium uranate, and forms, when dried and gently heated, the fifth commercial uranium compound mentioned.

Of the several uranium ores occurring in nature only two deserve special consideration, namely, pitchblende and carnotite, as these ores are known to occur in quantities in the territory of the United States sufficient to answer the purposes of commercial exploitation. The former ore is mostly encountered in the form of pockety formations, while the latter is found in fissures, sometimes over 2 feet in thickness, or in blanket formations breaking through the adjoining rock of sandstone deposits, sandstone cliffs or decomposed silicates. Both of these minerals are readily recognized by their appearances and specific gravity, since pitchblende is velvet-black in color, when unaltered, and, when partly decomposed on the surface, of a brownish or grayish tint. Its luster is sub-metallic or dull, and its streak black, while its specific gravity reaches the figure 9.2 and 9.3, so that the mineral can be readily distinguished by its weight or heft. It is composed of a mixture of uranous and uranic oxides—$UO_2 .2UO_3$ or U_3O_8—chemically speaking, with casual admixtures of small percentages of lead and iron, and is of special interest to the scientist, since it gives off, on heating with sulphuric acid, several rare and newly discovered elements, among them radium and polonium, two radioactive substances.

The second uranium ore of importance, carnotite, has been discovered but recently, and been named thus from the French scientist, Carnot, who first ascertained its composition and was especially instrumental in bringing it to prominence. It is of slight reddish-yellow color, hence easily distinguished, crumbles readily into powder, and leaves traces wherever placed or whenever touched, as it is very soft and brittle, when pure. The ore varies in contents of uranic oxide from 52% to 15% or less, and carries values of vanadium pentoxide in quantities of 18% down to 4%, being mainly a hydrous potassium uranium vanadate, as becomes apparent from the following analyses:

showing that the silica predominates in some of these ores to a marked degree, and that they were presumably produced by infiltration and subsequent oxidation.

These ores are of extraordinary value on account of the presence of the two rare metals, uranium and vanadium, the former being quoted in the New York market at $10 per unit and vanadium pentoxide, usually called vanadic acid, at $9 per pound. They are separated from accompanying impurities and gangue by mechanical means, then concentrated by a chemical process and shipped in the form of oxides to New York and thence to English, French and German ports.

Though the analyses given above show the presence of both uranium and vanadium in the ore, this is not always the case, since the writer had occasion recently to analyze an ore of this class of a light canary yellow color which he considered as identical with carnotite in the beginning, but which on careful research showed the complete absence of uranium compounds and was finally recognized as a pure vanadate. Vanadium compounds being still more valuable than those of uranium, and the market for them having been widened by modern inventions in Germany, England and France, the discovery was by no means a disappointing one, and is expected to lead to interesting researches and remunerative speculation.

The country contiguous to the Paradox valley, Montrose county, Colorado, in which the carnotite deposits described above are found, consists of apparently barren cliffs and its most mineralized section lies between that valley and the San Miguel river to the north. A recent shipment of a carload of uranium ore from this part of Montrose county brought the sum of $3580, representing the net profit on the lot, after deduction of mining and transportation expenses. Several small lots which were sent to Denver to be tested gave returns varying in value from $200 to $1600 per ton, the former figure showing the average price offered by the State sampling works for the material. These ores, when mined, contain as a rule from 8% to 10% metallic uranium and their market price increases with the relative degree of concentration.

The recent discovery of a pure vanadate, as indicated above, occurred in a quite different part of the State and is of material importance, since the metal vanadium and its compounds have come prominently to the front during the last two years by the researches of several chemists, among them S. O. Cowper-Coles, who succeeded in producing metallic vanadium of a silver-white color by the electrolytic process. While the fusing point of the metal uranium lies near 1500° C., that of vanadium approaches 2000° C., a circumstance which has induced German manufacturers to utilize vanadium together with zirconium and thorium in the production of gas mantles and similar articles. The fact has also been established that a limited addition of vanadium carbide to fluid steel improves the tensile strength and ductility of that substance, while copper and aluminum are affected in a similar manner.

The usefulness of vanadium and its compounds is further exemplified by the application of the latter in dyeing silk, and printing calico, and by the forcible effect of diminutive amounts of them in the conversion of aniline colors into fixed dyes for indelible inks.

Samples of the ore containing the vanadate, which yet remains to be named, will be submitted to the Smithsonian Institute and the Government chemists for examination and analysis, and the results obtained will be reported in time. A comparatively inexpensive method having been established for the separation of uranium from vanadium compounds and the production of the oxides of the two metals on a commercial scale, it is expected that these conditions will induce renewed efforts in locating deposits of this class, the more so as these possibilities are enhanced by the characteristic properties of the minerals and the high market price maintained for them throughout the civilized world.

A Cooling Tower.

At the Center Star mine, Rossland, B. C., the new forty-drill compressor, which has lately been installed on this property, is worked by steam power, and water in considerable quantity is needed. The compression of the air sets free the latent heat contained in the greater volume uncompressed and its being stored in the lesser compressed volume heats it, and by its presence tends to work against the power used to compressation by expansion.

The air in the low-pressure cylinder is compressed about twenty-five pounds. The low-pressure cylinder is a double one, the outer being a water jacket, and between the two a constant circulation of cool water is passed through, which, condensing the air in volume, allows of the utmost compression commensurate with the power exercised. Hence the compressed air passes into an intercooler, which is also the means of communication between the high and low pressure cylinders. This intercooler is filled with a mass of pipes, through which flows a constant stream of cold water. The partially compressed air then enters the high-pressure cylinder, where a greater force of compression—expressed by eighty-five pounds in practice—is used. After this it enters the main pipe, leading the air to wherever it is needed. In the high-pressure cylinder, as in the low-pressure, a water jacket is placed.

With the system of water jackets and intercooler pipes a great quantity of water has to be used. In addition, the water used must be cold. The steam also uses a quantity of water; and if the exhaust steam is allowed to pass off, much water will have to be brought to the machinery. The exhaust steam is, however, passed through a condenser, which discharges warm water into a pipe which, running round the outside of the building, takes up the discharge from the water jackets and intercooler and is pumped up to the top of the cooling tower. Here, after being cooled, it is run into a tank situated under the floor of the compressor room and thence is pumped into the water jackets, intercooler, etc., completing the circulation. A certain amount is lost through evaporation and other subsidiary causes, and this loss is made up by a stream of water flowing through a small pipe from outside sources into the tank. The pipe would have to be of considerably larger dimensions were the cooling tower cut out of the circulation. The pump forcing the water from the tank through the circulation system takes its supply from the upper part of the reservoir, so as to allow of sediment to drop to the bottom. This in turn can be blown off by means of an outlet below.

The double cooling tower is about 40 feet in height, 36 feet in length and 6 feet in breadth, divided longitudinally by a rough boarding rising to the top of the tower. The water, being pumped up to the summit of the erection, flows along each side of the top in two pipes, which discharge through eight valves into troughs to the right and left. Over the beveled edges of these troughs the water runs over and drops onto the sides of the tower, filled in by a series of smoothed boards set at an angle of 45°, resembling a Venetian blind. Each shutter is 6 inches broad. At its lower edge a metal strip, turned up along its front, catches the dripping water and directs it to the back, where it drops onto the next shutter 6 inches below. The inner edge of this shutter is about on a level with the outer edge of the shutter above. This process is repeated thirty-five times, when the water, thoroughly cooled by its passage in, drops through the air and reaches the metal-sheeted floor, where it is held to run over at the lower end of the floor, which is set at a slight angle, into a pipe which feeds the tank under the compressor room. The longitudinal division of the tower converts each side into a chimney, and a constant updraught of air is thus mechanically obtained.—Rossland Miner.

Silver Smelting in Mexico.

NUMBER V.

The following are examples of silver ore beds:

	SiO_2.	Fe.	CaO.	Zn.	S.	As.	Ag. oz.	Moisture.
VI	35.5	7.0	17.8	1.0	4.8	1.0	53.6	8
VII	44.2	4.6	14.7	2.0	2.4	..	263.3	8
VIII	73.4	3.5	6.8	1.5	2.3	..	30.0	..

No. VI is the type of a low-grade silver ore, valuable on account of the large percentage of lime it contains.

No. VII is the type of a high-grade silver ore with the same characteristic as the former.

No. VIII is the type of an ore which was used as siliceous flux in matte concentration. Such ores as that can only be procured at special rates, as the deduction for excess of silica and the treatment charge would prohibit their shipment to a smelter. If at all suitable, they can be treated cheaper by the patio process, which costs $13.45 per ton, and yields from 93% to 94% of silver.

The following are examples of Angangueo ore from the Michoacan Railway & Mining Co., successors to Las Trojes Co.:

	SiO_2.	Fe.	CaO.	Zn.	Al_2O_3.	S.	Pb.	Ag. oz.	Moisture.
IX	15.6	35.9	1.0	6.8	1.7	8.2	..	32.1	5
X	14.3	37.9	0.9	5.6	..	6.2	1.0	35.9	6

No. IX is the coarse ore (gabarro) from the Angangueo mines. Wood being plentiful and cheap in that part of the country, the ore was roasted in heaps at San Marcial at a cost, it is claimed, of $1 a ton. This ore did not fit in very well with the ores treated at smelter No. 3, and was therefore not frequently put on the furnace charge, but when it was used in large quantities it made the furnaces run very fast. This caused, however, other inconveniences of a serious nature, counterbalancing the gain by increased tonnage, of which I shall speak later on.

No. X was the fines or tierras from the same mines. They were calcined in the long-hearth furnaces of the smelter, but the sulphur was not reduced to the proper point, owing to the insufficient duration (twenty-four hours) of the roasting operation. The roasted tierras have just the contrary effect upon the speed with which the charges descend in the blast furnace; they reduce the tonnage by fully one-third of the normal, and act badly otherwise. While a furnace 42 × 120 inches will take ninety charges of 1000 pounds in twelve hours with the gabarro on, it will only take fifty charges with the tierras on, the normal speed being seventy-five charges.

The tierras should be bricked in a machine prior to being put into the smelting furnace. Another mean product received from Angangueo was matte made from the ores there in a water-jacket cupola. This matte contained neither lead nor copper, but 70% of iron, 6% to 9% of zinc, and thirty-five ounces silver per ton, if I remember right. It was difficult to comminute, and did not roast well at all.

The roasted matte from the ore smelting, so-called first matte, used in part as iron flux, had the following approximate composition: SiO_2 0.8, Fe 42—45, S 2.8—4.2, Cu 3.1—9.2, Pb 13, Ag 67—100 ounces.

When copper percentage rose to 9%, the matte was roasted again and smelted in a separate blast furnace with silicious ore, metallic iron, limestone, and lead dross and scrap for concentrated matte, which was shipped and sold. Below is a sample of shipping matte: Cu 37.5%, Pb 12.0%, Ag 157.3, ounces per 2000-pound ton.

If the siliceous ore was not sufficiently free from sulphur, an intermediate matte would fall, which had to be re-roasted and smelted to attain the proper concentration.

In computing the smelting mixture (furnace charge) the following slag formula was ordinarily used: SiO_2 34, FeO 34 = 26.4, Fe CaO 17, RO 15.

This kind of slag was selected on account of its easy fusibility at a low blast, and because there was an abundance of ferruginous ores in hand. Different conditions prevailing, other types of slag were made; for example, when there was a famine of silicious ores this type was used: SiO_2 32, FeO 34 = 37.3 Fe, CaO 12, RO 8.

Under RO are comprised alumina, baryta, zinc oxide and other bases which have no particular bearing on the character of the slag. Magnesia is figured as calcium oxide in the ratio of their molecular weights. With baryta, when present in the ore as sulphate, that method would not do, for it is not known what part of it will remain in the shape of BaS; it is, therefore, preferable to call the sulphate of baryta RO, and leave it out of the calculation.

Fluorspar is inert, and the calcium corresponding to the fluorine must not be drawn into the calculation. I also consider it wrong to calculate any part of zinc oxide as lime, as it is carried off by the slag mechanically and not in chemical combination.

An average of the slag analyses for six months gives the following result: SiO_2 34.04, FeO 34.30, CaO 17.65, Zn 3, RO 10.01, total 99. Lead contents were 1.1%, silver contents 1.2 ounces per ton. The bullion contained 218 ounces of silver. The slag agrees pretty well with the formula used. The slag from matte smelting did not agree so well with the prototype, although it was frequently corrected. The average composition of about 100 analyses was: SiO_2 41, FeO 32.8 = 25.5 Fe, CaO 16, RO 10.2, Pb 0.8, total 100.8; silver, 1 ounce per ton.

In calculating furnace charges the first consideration is the percentage of lead to be carried, and, secondly, the required grade of the bullion in silver. With a high percentage of lead, the extraction of silver in the bullion will be correspondingly high, and the fusibility of the charge will be increased, while with a low one considerable silver will go into the by-products, and, incidentally, into the slag, and the fusibility of the charge will be decreased. There exists, however, no law in regard to the exact quantity of lead required for the perfect extraction of a given quantity of silver from the ore, too many factors interfering with the union of these two metals. Practice alone can dictate what is proper to do in order to obtain the best metallurgical and commercial results. I consider 12½% of lead in the charge a fair proportion for bullion containing up to 400 ounces of silver per ton, provided that such disturbing elements as zinc and barium sulphate are not present in quantity. At smelter No. 3 the amount of lead in the charge was arbitrarily set at 11% by the owners —a figure which was not always justifiable.

In order to show how necessary it is to have high and low-grade silver ores on hand to choose from, I have computed a smelting mixture on the above slag formula from ores Nos. I, IV, VII, IX, and matte, taking the latter at 42 Fe, 2.8 S, 3.1 Cu, 13 Pb, and 67 ounces silver per ton. Sulphur is allowed for the copper present to form cuprous sulphide. The balance is multiplied by the empirical factor 1.3, except in matte, where sulphur is multiplied by 1.75, to get the iron necessary to satisfy the sulphur not volatilized. This iron is deducted from the iron in the charge to obtain the iron available to satisfy the silica. Since half charges of 500 pounds are weighed up at the charge scales, the computation is made for a half charge. The silica, iron and calcium oxide contained in 200 pounds of slag are drawn into the calculation, but the weight of the slag is not considered as part of the charge, according to the prevailing custom. The half charge will then be composed of 245 pounds bed I, 140 pounds bed VII, 20 pounds bed IX, 20 pounds bed IV, 35 pounds roasted matte, 40 pounds limestone, total 500 pounds.

This half charge contains 72 pounds of lead (14%), and should make a bullion containing 600 ounces of silver, provided no matte were produced.

The amount of sulphur in the half charge is 9 pounds, that of zinc 10.3 pounds, and that of copper 1 pound. There are four basic materials in this mixture to be satisfied with silica. If we leave out the one containing the most zinc—that is No. IX—the charge will come out as follows: 200 pounds bed I, 155 pounds bed VII, 75 pounds bed IV, 35 pounds roasted matte, 35 pounds limestone, total 500 pounds.

In this half charge there are contained 64.6 pounds lead (13%), and a bullion of 718 ounces of silver should be produced. The zinc in the half charge amounts to 9.6 pounds, the sulphur to 8.6 pounds, and the copper to 1 pound.

Since it is inexpedient to make such high-grade bullion, it follows that low-grade, siliceous silver ore should be mixed in to reduce the grade of the bullion. The amount of slag added to the half charge to promote fusion is 200 pounds, or 40%. It is remarkable how much the speed of the furnace is affected by the addition of slag. I have had occasion to cut it down to 100 pounds and to smelt even without addition of slag; but there was always a falling off in the tonnage of the furnace, and the resulting slag looked sickly, which can better be seen than described. The amount of coke considered necessary for proper reduction is 14%, more or less. The half charge requires, therefore, 70 pounds.

The order in which the charge is shovelled into the furnace is first the fuel, then the charge and last the slag and any dross or speiss that may have to be disposed of. It is essential that the charge should be well spread in layers of equal thickness. To determine whether 140 pounds of coke will fully cover the area of the furnace, a frame could be made representing this area and put on the floor. By shovelling the coke into this frame, and levelling it off, it is easily seen whether it will cover the whole area or not. If it should not, both the fuel and the ore charges must be increased in size. Some smelters put four charges into the furnace at once; this is quite practicable at an open-top furnace, but not at a side feeder. Besides, it is hard work for a Mexican to shovel without interruption for a longer period of time and do justice to a proper distribution. Irregular feeding is frequently the cause of derangement of a furnace and shortens its campaign. A vicious habit of the Mexican feeders was to pick the limestone from off the charge and throw it into the furnace by hand. The inexperienced would throw it all in one place. In sinking it would burn itself caustic, and, on coming in contact with the hot firebrick lining, it would form a fusible silicate, which, in its turn, would soon find its way through the red brick and eat out a big hole above the mantle frame. The only way to suppress such pernicious practice is to crush the limestone to pieces of about 2 inches; fines and dismissals only create hatred against the employers. One furnace that was well served ran uninterruptedly for 328 days, while some of the others which received the same charge, but had bad feeders, would scarcely average ninety days. The operation of "barring out" a furnace—that is, to chisel off the wall accretions (embanques) without blowing out the furnace, as it is done in Colorado—is impracticable in Mexico. The temperature of the atmosphere is hot enough without going into a furnace, and the workmen have no changes of clothes nor habitations that would protect them from contracting fatal diseases, like pneumonia. Excessive fuel and high blast drive the fire up in the furnace, and cause it to blaze at the top, whereby metals are volatilized, and the formation of flue dust is increased.

Supposing the composition of the slag be correct, as proved by the analysis, its assay value indicates in some measure whether the fuel proportion is too high or too low. If, for example, the slag assays 1% lead and 3 ounces silver per ton, the reduction of iron has been excessive, and the fuel must be cut down. If, on the other hand, the slag runs 3% lead and 1 ounce in silver, the temperature has been insufficient to reduce or precipitate all the lead, and the fuel charge must be increased.

(TO BE CONTINUED.)

California Oil Production.

The California Petroleum Miners' Association furnishes the following as the result of careful efforts to secure fairly reliable information as to the present scale of operations. The statements are stated to be "the result of much correspondence with the best informed people of the various oil regions, the estimates of many competent authorities and the compilation of all current information."

There are 271 wells in process of sinking; of these, 142 are north of Tehachapi, mainly in the San Joaquin valley.

DRILLING WELLS.

San Joaquin District.—Coalinga 32, McKittrick 29, Kern River 35; total 96.

Los Angeles.—Westlake Park and elsewhere 38.

South Los Angeles.—Whittier 11, Brea Canyon 12, Puente 7, Fullerton 14; total 44.

Ventura District.—Newhall 13, Piru 19, Santa Paula 11; total 43.

Santa Barbara District.—Summerland 4.

Kreyenhagen District.—Kreyenhagen 38, elsewhere (Mendocino, Colusa, etc.) 8.

DAILY OIL PRODUCTION—BARRELS.

San Joaquin District.—Coalinga 1454, McKittrick 450, Kern River 823; total 2727.

Los Angeles District.—Large and small producers 4088.

South Los Angeles.—Whittier 725, Puente 314, Brea Canyon 150, Fullerton 875; total 2064.

Ventura District.—Newhall 361, Piru 868, Santa Paula 805, Callegues 20; total 2054.

Santa Barbara District.—Summerland 533.

Total daily production 11,466 barrels.

TANKAGE—BARRELS.

Los Angeles.—Union Oil Co. 35,000, S. F. R. R. 40,000, Oil Storage & Transportation Co. 165,000, S. P. R. R. 45,000, Standard Oil 50,000, total 335,000.

South Los Angeles.—Union Oil Co.: Brea Canyon 6000, Bixby 17,000, San Pedro 35,000, total 58,000; Central Oil Co. 20,000, Home Oil Co. 4000, total 24,000. Total South Los Angeles 82,000.

Ventura.—P. C. Oil Co.: Ventura 27,000, Newhall 20,000, total 47,000. Union Oil Co.: Santa Paula 68,000, Ventura 41,000, total 109,000. Modelo Oil Co., Piru, 4000. Total Ventura 160,000.

San Joaquin.—Kern & McKittrick 40,000. Union Oil Co.: Oil City 32,000, Coalinga 15,000, total 47,000. Chanslor & Canfield 8000. Total San Joaquin 95,000.

Refineries.—Puente Oil Co.: Chino 77,000, Puente 15,000, total 92,000. Union Oil Co.: Oleum 60,000. Pacific Coast Oil Co.: Alameda 60,000. Total refineries 212,000. Total tankage 884,000.

MINING SUMMARY.

ALASKA.

(Special Correspondence).— The transportation people are making strenuous efforts to keep up the boom and nearly all the Dawson gold is shipped from this port, which, I understand, Nome will be credited with. This city of 15,000 people, or more, is kept up by the money of people who brought the money here from the States and the little taken out of the beach sands, and now the latter is cut off by a decision of Judge Stevens' commissioner.

The Lane party has blown in a large amount of money, of which the greater part may be lost. They will take out but little money this year, and probably not much more next. Some of the claims on Anvil are paying very well, but most of them are a blank. No. 2 below Lane's is closed down and nothing below No. 1 is or will be worked this summer, if ever. I have prospected the country from Port Clarence on the west to Golovin bay on the east, and found a few rich spots, which could soon be worked out if they had water. However, there are thousands of little creeks putting into the various rivers that carry gold in more or less quantity, which will be worked more or less for years to come. But claims that will pay $10 per day to the hand are extremely scarce, and they ask a fortune for them. That is not big when you consider that you can only work three months in the year at most. The only redeeming feature of this country is the tundra, which is usually from 40 to 60 feet deep and always frozen, and of its value but little is known. The lead pencil miners have this all located—hundreds of thousands of acres—and before they would let any capitalist have a bond, or what they call a lay, the capitalist must put up some money, which they are not doing, so far as I can learn. The country is full of stampeders and as soon as the cold weather is on they are to commence, and I am told they get more or less aid from the transportation and business men.

Nome, Aug. 3.

(Special Correspondence). — The rainy season has just set in, giving water in the gulches and enabling miners to work their ground. Some claims are being opened. There is an output from the creek claims, but not as great as it would be were titles more settled and litigation less rampant. Some of the best mines on and around Anvil creek are in the hands of the receiver, who is working them for the benefit, supposedly, of the litigants, but under their protests. Of my own knowledge bench claims have been discovered and the shafts filled in again, the locators simply deciding to hold the ground without working it or letting the value of the find become known until they can be reasonably sure of impartial judgments in the courts. This feeling of insecurity is general and is retarding all development. The beach miners, who number several thousand, especially feel the severity of this condition, as arrests are being made by wholesale, on complaint of any one who can show a recorded location notice, charging criminal trespass, so that the highly respectable citizen of the States finds, on operating his rocker or pumping plant on the beach of Nome, which he had thought free to all, that he is a common felon, and liable to imprisonment for from one to five years. The net result is somewhat disheartening, the more so that the profits of beach mining are, in most cases, doubtful or negative; and, as the local paper remarks, many are taking advantage of the low rates prevailing to leave. The Nome rush (outward bound) has begun.

One of the difficulties of beach mining, besides the legal aspect of from one to five different locators of tundra claims wishing to levy "royalty," with the aid of the criminal court, on an identical strip of beach (the same was not staked or claimed by them on the original location), is an occasional southerly storm, such as we are having to-day, rooting up the suction pipes and washing off the sluice boxes or rockers, washing in the pits and burying machinery if set too low. I notice one dredger (a barge in the open sea) has met disaster, and several tugs, two or three small sailing vessels and one sidewheel Yukon river steamer blown ashore and wrecked. The town is becoming "tough." The few sea dredgers are doing no good. The one on Snake river is believed to be making money. Staking off beach claims was very active on receipt of the news of the law passed July 6th. It is surmised that the present workers on the beach are one and all made to suspend in short order and perhaps the plants seized for damages already done the ground of the intending claimants. This stoppage will mean an almost total loss to the misguided who have machinery which they might stand a show of partly recouping if allowed to continue peaceably for the rest of the season, since, the expense of erecting plant, laying in supplies and experience of how to save the gold having been gained, the larger part of the ground will pay a profit for running through a sluice box. The judge's nephew is "receiver" for most of the Anvil creek claims in litigation. There is probably not less than $1,000,000 worth of machinery on the beach. For myself, the result will be a net loss. I shall return. I have sense enough not to fight the powers that be. While many of the miners feel like holding a hanging bee—with the court for hangee—wherein they would be assisted by the toughs, they would not hold together—are pretty generally discouraged and ready to go "home to sin no more." The ground I am now working returns about $25 a day to the shovel—that is, two shovels day and two at night—$100 cleanup. I only want a few more days at it to finish the ground, which is shallow and narrow, but may be stopped any day. But little importance is attached here to the Bristol bay finds.

Nome, Aug. 4.

Ten more stamps started at Silver Bow basin last week. The Nowell red mill is crushing 2000 tons float quartz from the hydraulic claims; average value $6 a ton.

Ten more stamps are ready at the Ebner mill at Windham. W. Denby has charge of the property.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The mill at the Commonwealth mine is being rebuilt, work having commenced last week. The new mill will be almost a duplicate of the one destroyed by fire a few weeks ago, and it is planned to have it ready to operate by Jan. 1st.

Pearce, Aug. 15.

Supt. Clifford at the Peabody, near Pearce, is reported shipping three carloads a day of copper ore and employing 125 men.

The Solomon Springs Con. M. Co. has incorporated at Bisbee; incorporators, J. G. Pritchard, A. J. McDermott, J. B. Angius, D. O. Williams, R. Humphrey, A. S. Pritchard.

COCONINO COUNTY.

The Central Arizona M. Co.'s property, 40 miles north of Williams, has been bought by Eastern people for $100,000 cash. The new company will put men to work.

The Sunset also passed to the same company for $10,000. Both mines are of blanket formation, carrying copper.

GILA COUNTY.

(Special Correspondence).—The Darius Green M. Co. has under construction a 200-ton plant for treating placer ground by the dry method.

The Black Warrior Copper Co., Amalgamated, has let contract for sinking of 200-foot shaft on its gold gulch sulphide property, west of Globe. This shaft is in sulphide ore, carrying 12½% copper.

Black Warrior, Aug. 20.

The Times says Supt. Cook of the United Globe is unwatering the Hoosier mine to the 800-foot level, when work will be resumed, and that a new three-compartment shaft will soon be under way.

PIMA COUNTY.

Supt. Wakefield says he finds no walls in the Hardshell mine at 300 feet depth. The ore yields lead and silver.

YAVAPAI COUNTY.

(Special Correspondence).—D. Hatz is mining on the southwest side of Senator mountain, 10 miles south of Prescott. W. Rowe is shipping 100 tons of ore to Pickerell's mill for concentration from the Wren mine. W. Kent is running a tunnel on Davis No. 2, with good ore. A. Limburger and partner are working on a lease on the Helvetia mine.

Prescott, Aug. 20.

The Empire mine, on Groom creek, 7 miles from Prescott, has a mill of ten stamps, of 1000 pounds weight each, and a cyanide plant; S. S. Jones, Supt.

The Jerome News learns that Jerome workmen receive high wages. At Morenci and Clifton miners and timbermen receive $3 for twelve hours work and the laborer $2 for twelve hours work. In Jerome the miners and timbermen are paid $3.50 for eight hours work, feeders $3.75 for eight hours, tappers $3.75 for twelve hours, and the lowest wages paid unskilled labor for a ten-hour day is $2.50.

YUMA COUNTY.

(Special Correspondence).—It is reported here that L. F. Bradshaw, one of the original locators of claims at Leadville, Colo., twenty years ago, has discovered a rich district of many veins, carrying gold, silver and copper.

Yuma, Aug. 20.

CALIFORNIA.

AMADOR COUNTY.

Ledger: At Jackson the force at the Argonaut mine has been reduced pending the result of present litigation.——At Amador development work at the Fremont and Gover mines continues.——At the Bunker Hill, Amador, cleaning out the old shaft and retimbering the same goes on.——The Peerless shaft will probably be sunk to a depth of 1000 feet before drifting or crosscutting is begun.——An upraise from the tunnel to the surface, 80 feet, has been made at the Kirkwood mine; it will form the upper part of the shaft, which is to be 5x14 in the clear, with two compartments and manway.

BUTTE COUNTY.

The rock in the tunnel being run by the Banner Co. to carry water from Cherokee is so hard that twelve men can only make 3 feet headway; two men can make but 6 inches in eight hours' time.

CALAVERAS COUNTY.

Work in the 1400-foot tunnel at the Melones mines, at Robinson's Ferry, is discontinued. The entire force has been put to work on the dam in course of contruction on the river a mile above.

CONTRA COSTA COUNTY.

The American Oil & Refinery Co. held its first annual election of officers on the 20th inst.: Prof. E. P. Heald of Heald's Business College, Harrison Barto of Geo. Spaulding & Co., printers, L. F. Haskell of San Rafael, Dr. J. C. Anthony and W. E. Holbrook of San Francisco, directors. After the directors organized the following officers were elected: W. E. Holbrook president, Harrison Barto vice-president, J. C. Anthony secretary. The president of the company stated to the stockholders that they had well No. 1 on the company's land down 1306 feet, and had found in the well a fine quality of oil; that they had built a tank 26 feet diameter, 16½ feet high; had placed in 2208 feet 2-inch pipe; that derrick No. 2 was up and completed, with sand reel, rig irons on the ground, awaiting the placement of engine and boiler; that they would push well No. 2 as fast as possible, and that they had hired a new superintendent for the ensuing year, who comes from Ohio, to take charge of the work within the next twenty days.

EL DORADO COUNTY.

Men are inspecting the Carey mine near Josephine.

Georgetown miners find ready employment at Long Canyon.

J. E. Shuttle is manager Chicago M. Co., near Nashville.

The new mill is expected to be in operation at the Expansion mine, 7 miles west of Placerville, this week. A 22 H. P. gasoline engine furnishes the motive power.

A San Francisco company has bonded and begun development work on the Monitor quartz mine, 6 miles south of Shingle Springs.

The Chicago M. Co. is sinking on the Chicago quartz mine, near Nashville.

A milling plant capable of working fifty tons of ore per day is to be built at the Crystal mine, 3 miles south of Shingle Springs.

At the Hart Con. a new tunnel is being driven in the mountain that will tap the four parallel ledges. The owners are arranging for a 10-stamp mill. The property is below the ditch system of the California Water Co.; 400 feet of pressure can be had for power purposes.

HUMBOLDT COUNTY.

The Orleans Bar G. M. Co. still has water enough to run its mine night and day, but must soon shut down.

INYO COUNTY.

At the Ballarat M. Co.'s property the superintendent says that in the main ore chute he has ore that shows $146 gold, fourty-four ounces silver and 8% copper, and a new shaft on the group has exposed 16 inches of ore which shows $313.75 gold per ton.

KERN COUNTY.

Last week was reported a decision of the Supreme Court ordering the county recorder to pay over to the county fees received for recording mining claims. An application is to be made for rehearing in bank in the case. Recorder Lee says if he were inclined to accept the late decision as final, he could not in fairness to those associated with him give up the contest until all legal resources had been exhausted. The recorders of all counties classed as mining counties are interested with him, and have been assisting him in carrying on the litigation. The question is as wide as the State. The amount of fees paid in and retained by Recorder Lee is at the present time $4893.

A. E. Walsh says that in the Garlock district there is base ore, but no smelter to treat it nor a railway within 20 miles of it —too far to haul and ship at a profit. Wood and water are abundant.

Goldsmith & Robb had thirty tons of ore crushed at the Kinyon mill which netted $25 per ton.

The Blue Chief mine has been incorporated by W. James, F. G. Munzer, H. I. Tupman, R. A. Edmunds, F. A. Brown, on Greenhorn.

MARIPOSA COUNTY.

Gazette: The Grant people are having 200 tons of ore, taken from the Mariposa mine, hauled to their mill at Princeton.

MONTEREY COUNTY.

(Special Correspondence). — P. Gillis found some nuggets in his claims on Spruce creek, one of several small creeks running from the Santa Lucia range into the ocean. F. Melville has been taking out nuggets from $1 up to $12 in value on the head of Spruce creek. Within the past two months Gillis has taken out hundreds of dollars in coarse gold, and with very poor appliances, much of the fine gold escaping. Thursday's yield was a nugget worth $250. Those who doubt the above statements can call on Marshall & Teggart, 306 Davis street, San Francisco, who have the nuggets consigned to them by Mr. Gillis, except the last and largest.

The Cruikshank mill has made two runs on good ore from two mines recently, and is about to make a run on ore from the Last Chance mine.

The last work done in the Grizzly mine showed ore that assayed $522 per ton.

Los Banos Mining District, Aug. 20.

NEVADA COUNTY.

(Special Correspondence).—Butt & Giffen are giving a half interest in their mine, the Pennsylvania, at the foot of Old Man mountain, to Mrs. Gay of Sacramento, in consideration of her putting up the old stamp mill formerly used by the Grant mine. They will concentrate their ore. Careful management ought to make this proposition pay.

Captain E. O. C. Ord, U. S. A., was here a few days ago and took up a mill site near the old place called Ossaville. He and his company have in contemplation the erection of a 10-stamp mill and will use the best concentrators to save the sulphide material.

Mr. Best of Los Angeles, who was here last fall and bonded some claims, writes that he is confident of getting his company together and making his first payment on Sept. 1st.

Both the above parties have some good prospects among their bonded properties, and if they go at it wisely they can not help winning success.

We dislike to see the disposition for one man to post notices on more claims than he can do the work. This has been the ruin of more camps than one, as it holds back the true prospector from his work.

Meadow Lake, Aug. 20.

From God's Country a 10-stamp mill will be moved from W. H. Mead's mine, down on the river near Maybert, for the company operating the Champion and Lindsay mines, who will locate the mill between the two properties, which will allow of ore from both being crushed.

C. J. Schuster, Supt. of the Grizzly Ridge mine, Columbia Hill district, intends putting up a small mill, "large enough for prospecting purposes."

PLACER COUNTY.

The J. D. Peters M. Co., at Green Valley, after running the lower tunnel 1000 feet, made an upraise of 110 feet and found gravel. They are putting in chutes to handle pay dirt through lower tunnel, using upper tunnel for waste.

The Boston News Bureau says "Pioneer has advanced from 15 cents to 25 cents on a report that its troubles are o'er or lack of ore is o'er."

PLUMAS COUNTY.

J. B. Ratliff, Supt. Bullion mine, Mohawk Valley, is about to sink the shaft 100 feet deeper.

The bond which A. B. Summers had on the Peter mine, Indian valley, is renewed for fifteen months. He is locally credited with intention to sink 500 feet deeper.

SACRAMENTO COUNTY.

The mining dredger at Sailor Bar, on the American river, is expected to start this week. The dredger has been built to order for the Boston company which bought Sailor Bar after prospecting the property. The locality is below Folsom, opposite Salisbury station.

The Key City Copper M. Co. has incorporated in Sacramento; directors—A. G. Folger, A. Wasson, W. K. Cothrin, E. H. McKee, W. McLaughlin; capital stock, $100,000.

SAN BERNARDINO COUNTY.

Virginia Dale district reports the sale of the Ivanhoe mine to Los Angeles men for $20,000. Four shafts have been sunk—one 200 feet in depth and the others about 135 feet.

The Needles Smelting Co. has incorporated at San Bernardino. The five directors are R. Charlton of Needles, C. H. Granger, K. S. and C. S. Corning of Pasadena, W. Rodman of Los Angeles; capital stock, $50,000; subscribed by C. S. Corning, $49,600.

SAN DIEGO COUNTY.

The cyanide plant at Julian is engaged on the tailings of the Stonewall mine.

J. M. Risher has bonded the properties of the Owens Con. M. Co. The price mentioned in the bond is $30,000, which D. Clark has assumed.

SAN JOAQUIN COUNTY.

Stockton reports that Eastern men will build a smelter there, and now have an option on a suitable site.

SHASTA COUNTY.

The Searchlight asserts that a 30-inch gauge railroad will be built from the mines to the Copper City smelter, and that the smelter is to be constructed on the site first chosen.

Free Press: The U. S. District Court has decided a case involving a point of great interest to mining men, to the effect that the often-heard contention that claims may be filed on mineral-bearing railroad land, whether patented or not, is invalid. If a patent has been issued to the railroad company claims cannot be filed upon the land. The case in which the decision was rendered was a suit for ejectment brought by the Mountain Copper Co. against Maginnis, Myers et al. The mining company purchased several parcels of patented land adjoining their Iron Mountain property from the railroad. Maginnis and the others located claims upon the land. The M. C. Co. brought suit in the Superior Court. The suit was transferred to the Circuit Court. It is stated that the defendants relied largely upon the clause in the patent issued to the railroad which specifies land "without minerals." The Circuit Court in deciding for the plaintiff holds that the clause referred to is meaningless, since otherwise no clear title could be conveyed by patent to the large acreage of land whose mineral or non-mineral qualities are open to question.

SISKIYOU COUNTY.

The failure of the Portland G. E. cyanide plant appears to have been caused by overestimating the amount of tailings on the dump and in inability to treat the sulphurets.

S. J. Fore, at Coles, has a 10-stamp mill on the Mt. Sterling mine. He says "the cost of mining and milling is only $1 per ton." He has bonded the Blue Jay mine and has built a $2600 wagon road to bring in a 10-stamp mill, and has a sawmill in operation. He will be ready for milling to begin next week. Eighteen men are at work. Development work consists of a 450-foot tunnel, another of 225 feet, a shaft 125 feet and a tunnel to crosscut the extension now in 200 feet.

TRINITY COUNTY.

The new stamp-mill machinery for the Brown Bear Co. at Deadwood is on the ground and the buildings being erected.

F. Hall has secured bond on the Driver placer mine, Oregon gulch, and three claims belonging to the Blake & Reed Co.

TUOLUMNE COUNTY.

The Mother Lode hears that Captain Nevills will resume charge of the Rawhide mine.

The Carters New Era says all the claims against the Temescal have been settled and operations resumed. F. P. Holling, secretary of the new company, arrived in Confidence this week and took charge of the property. Retimbering and enlarging the main working shaft at the Confidence is progressing; the mill is being given an overhauling. At the Grizzly the main shaft is 820 feet deep. When 20 feet more has been made, which will give 40 feet of sump room, sinking will be discontinued, a station put in at the 800 mark and the vein drifted on. A new hoist will be placed on the mine and electric power used, thus permitting the mine to be operated the year around.

At the Harvard mine, Supt. Munger says lack of water has compelled him to lay off twenty men.

Thomas C. Gorrie of Haywards has taken charge at the Santa Ysabel mine as superintendent. The mine will be unwatered.

The Shawmut G. M. Co. has returns of $1612 in free gold. The tailings, thought to be worth $4000, will be treated in the cyanide plant, capacity fifty tons daily, which will be completed Oct. 1.

Supt. Meighan has removed the office of the Boston & Tuolumne M. Co. to Groveland.

Magnet: At the Deadhorse, the deepest mine in Tuolumne county, they will soon close down. Then the shaft is to be retimbered and a powerful new hoisting plant put in preparatory to resuming sinking.

Independent: Near Sonora the Miller & Holmes mine is being unwatered.——Operations have been temporarily suspended on the Imogene property.——Owing to the lack of water for power, the Bonanza Co. have pulled out their pumps; the mine will fill with water.——A new property is being operated on the Comstock ranch, in the East belt, by the Golden West M. & M. Co. of San Francisco. The tunnel is in 850 feet; when 150 feet more is driven, a double compartment shaft will be sunk.——The Gagnere mine, Tuttletown, operated by the Tricolor Con. M. Co., is putting in a 12x18 duplex compressor; when completed, sinking in the three-compartment shaft will be resumed. This mine has a water supply the year round.

VENTURA COUNTY.

The deal whereby the oil lands of Senator Bard in Ventura county pass into the hands of Los Angeles men is $350,000. Development of the property will be on a scale proportionate to the magnitude of the enterprise.

The Frazier Borate M. Co. is developing a borax deposit near Giffin. Locations cover 2400 acres. All the local stockholders except Gail Borden have sold out to the Stauffer Chemical Co. of San Francisco and Thomas Thorkeldsen & Co. of Chicago. Christian De Guinge of San Francisco is president of the company and Gail Borden secretary. The veins vary in thickness, being in some places 12 feet wide. The mining is done by hand. The ore hauled 60 miles to the railroad is shipped to San Francisco and Chicago. The Frazier Company is shipping 150 tons a month. A railroad from Bakersfield will reduce the wagon haul to 30 miles, and then the Frazier Company will put in a traction road.

A find of boracic ore is reported from Seymour canyon, 6 miles from Lockwood valley, from which about fifty tons of ore a month can be hauled. The new mine is named the Nighthawk. The average borate of lime ores, such as colemanite and pandermite, do not yield more than from 40% to 50% for best and from 25% to 36% of anhydrous boracic acid for average ore. The gross value of ore running 40% would be about $88 per ton; from this would have to be deducted loss in reduction, charges for mining, hauling, freight, and cost of reduction. The quotation of 44% ore is about $35 per ton in San Francisco.

YUBA COUNTY.

Nevada City Herald: Poorman & Hastings have a pay channel in their gravel mine below the Delhi mine, on the Middle Yuba river. The gravel is worked by hydraulic elevator; have expended $15,000 on the property.

COLORADO.

ARCHULETA COUNTY.

(Special Correspondence).—The Denver & Rio Grande R. R. is completing its branch from its Durango line to Pagosa Springs, which opens up a section having good resources, including mineral, timber, grazing lands and hot springs.

Pagosa Springs, Aug. 17.

CHAFFEE COUNTY.

The Buena Vista smelter is running to its fullest capacity. In the twenty-four hours 180 tons of ore are run, and twenty-five buttons obtained, which average $30.

CUSTER COUNTY.

Silver Cliff reports the Bassick mine receiving new machinery.

The Tellurium M. & M. Co. has effected a reorganization, extending the articles of incorporation twenty years. This company owns the Poorman mine at Querida and intends to begin operations and keep the work going. This property is developed by a main shaft 300 feet deep. Considerable drift work has been done. The last work was done on the property seventeen years ago, at which time ore running ninety ounces silver and three ounces gold per ton was taken out.

Work is progressing on the Elmatah at Querida.

DOLORES COUNTY.

The News-Sun at Rico says an ore buyer has bought 1000 tons of zinc ore which will average 60% for the Nicholson spelter plant at Iola, Kan., and that that section of Colorado ought to be able "to compete with the zinc mines of Joplin, and furnish the zinc plants of Missouri and Kansas with the greater part of their ore for treatment."

W. E. Bennett of Telluride and F. Stampfel and associates of Rico have bought the cyanide plant at Ophir. The former will manage the plant.

GILPIN COUNTY.

Central City reports the sale to G. P. Walford of London the westerly 667 feet of the Carr lode mining claim, Gregory mining district, Bob Tail hill, for $40,000. Of its product 60% is smelting ore.

The Gold Mining Investment Co. has taken a lease and bond for two years on the West Calhoun mine in Leavenworth gulch; in the directory are Adlai E. Stevenson, ex-Vice-President, C. H. Eckels, ex-Comptroller of the Currency, Mr. Phelps, ex-Assistant Treasurer, and Mr. Calhoun, first Governor of Cuba. The 150-foot shaft will be sunk 150 feet deeper. J. F. Tully is manager.

GUNNISON COUNTY.

J. P. Smith will start the old Lewis mill at Elko.

Supt. Grafflin at Gunnison is pushing the Zoorah tunnel, 9 miles southeast of Gunnison. It is in 1800 feet. About 800 feet in a room 16x24x16 feet high has been cut for sinking. The shaft will be 4x12 feet in the clear.

LAKE COUNTY.

(Special Correspondence). — Leadville stocks have been active of late, the buyers being mostly local people. As an example, the Canterbury, having sixty acres of patented ground on Fryer hill, with a 150-foot shaft, sinking for the contact, has issued stock that has sold well.

The Tarshish lease on seven and one-half acres adjoining the Adams, on Stray Horse gulch, has a 660-foot shaft, having opened ore at first contact at 250 feet depth. Prospecting is being done for the sulphide contact at the bottom of the shaft. Stock in the company owning this lease has been in some demand.

The Valentine lease of 100 acres, in the southwest part of the district, has three shafts, the deepest being just over the contact at 500 feet depth. Stock in this company is selling at 10@18c per share.

The Home Extension Co., whose holdings comprise mineral rights purchased of lot owners west of the Home M. Co. group, are sinking a shaft between Chestnut and Second streets. Stock in this company has sold at 25@40c per share.

Stock in the Home M. Co. is held pretty close at $8.50@9.00 per share, there being outstanding a stock issue of 50,000 shares of the par value of $1 per share.

The Doris, owning ten acres in Iowa gulch, has been a shipper in the past and has planned of late for new development.

The Hummer, under bond and lease, has produced a large amount of lead ore, has good prospect of getting soon into the sulphide contact. This is on Little Ellen hill.

The New Monarch, which ships 1500 tons per month of rich sulphide ore, in which the gold values are prominent, has a stock issue which sells almost at par.

The California Gulch lease on two and one-half acres, on both sides of that gulch, in sinking its shaft 500 feet has got into the blue lime stratum in which the ore is expected to be found.

In the Sedalia a drift is being run from the 800-foot level to catch the ore shoot on its dip from the levels above. The Sedalia has a stock issue of 1,000,000 shares, par value $1 per share, which has sold at 25c per share.

The Resurrection is a close corporation, with no stock on the market, shipments from the mine amounting to 150 to 200 tons per day. WASCOTT.

Leadville, Aug. 16.

(Special Correspondence). — The Colorado & Southern Railway is changing its Leadville trackage from narrow to standard gauge, which will enable this company to handle standard gauge cars from various mines of the district to the Colorado Midland, now a part of the Colorado & Southern. This enables the road to ship cars of ore from Leadville to Denver and Pueblo smelters without sending them by way of Breckenridge and over Fremont and Boreas passes.

The Penrose shaft, on the Home group, has encountered a heavy flow of water, which is being readily handled. As depth is gained the bottom of the shaft continues in ore.

Leadville, Aug. 18.

On Little Ellen hill, Leadville gold belt, the Iszard, alongside the Little Ellen mine, is being worked by Hobart & Smith.

Miner: General activity in Leadville district has caused large demand for all kinds of mining machinery, especially small hoisting plants and boilers. If the present demand continues it would be a paying investment to purchase small 6x8 double hoisters and 25 to 25 H. P. boilers for rental purposes. A plant of this kind will cost new about $650 to $800 and will rent for $25 to $30 a month.

OURAY COUNTY.

(Special Correspondence). — The new mill of the American Nettie mine started up last week. It is equipped with plates and concentrators and has a capacity of sixty tons per day. The ore is transported from mine to mill over a wire rope tramway, 1700 feet long. The Nettie is a gold property in the main, much of the ore being free-milling and high grade.

Ouray, Aug. 17.

At Ouray the Camp Bird reports a strike in the west drifts, in the upper or old workings, where a crosscut 37 feet wide in pay ore fails to show the walls. The sale of the property is not yet consummated.

PITKIN COUNTY.

(Special Correspondence). — Smuggler mill No. 1 is handling about 165 tons per day, the product being about forty-five tons of silver-lead concentrates; Smuggler mill No. 2 handles 100 tons per day, which is reduced to about 15 tons of concentrates.

The Mollie Gibson and A. J. mill, equipped with seven Huntingtons, twenty-eight vanners, with crushers and rolls, averages about 200 tons per day, concentrated from six to twelve tons to one ton. The Mollie Gibson ore is distinctively a silver-lead ore, while the A. J. ore contains very little of lead. Ores from both mines carry a considerable quantity of lime, which is largely eliminated in concentrating, as the lime cannot well be saved without gathering with it too much of the silica.

In various mines of Aspen the lime product is an important factor in settlements with the smelters.

The Aspen mine ships about 100 tons per day. The district, as a whole, ships out about 5000 tons of crude ore and 3000 tons of concentrates per month. The concentrates run high in lead, probably from 30% to 60%.

The Colorado Midland is extending a branch 1½ miles up Castle creek to get access to the Newman tunnel of the Percy Con. and other properties on the Castle creek side of Aspen mountain.

A new pumping station is being put in at 1060 feet depth in the Mollie Gibson. Pumps from the old A. J. workings will be installed there. The workings of the two properties are connected underground by a well-equipped trolley line.

Aspen, Aug. 18.

SAGUACHE COUNTY.

At Crestone the Independent mine is credited with having considerable ore blocked out, and the company operating it talks of building a 100-stamp mill and ultimate plans embracing 600 stamps.

SAN JUAN COUNTY.

By Nov. 1 the 3200-foot tramway line between the American tunnel and Gold King mill, near Silverton, will be completed.

TELLER COUNTY.

(Special Correspondence). — Parties in control of the Colorado–Philadelphia Reduction Co. at Colorado City and of the National Gold Extraction Co. of Florence have plans made for the erection of a crushing and sampling plant near Victor, which will have four sets of 16x36-inch rolls and two 15x24-inch crushers, and to have a capacity of over 1000 tons per day. This sampler will be an adjunct of the reduction plants of the companies named. The reduction plant of the Colorado-Philadelphia Co. at Colorado City employs chlorination as a means of extraction, and has run steadily, handling about 350 tons per day. This is doubtless the only one of the large mills in the valley which has recently run steadily at full capacity. This company is completing a second reduction plant of same character at Colorado City, which will be in operation before the close of the year, making the combined capacity of the three plants of this concern nearly 1000 tons per day. It is claimed this milling concern has the contract to handle the output of Stratton's Independence mine—whose shipments now amount to 200 tons per day—for five years. It is also pretty well understood that the Portland G. M. Co. will erect a reduction plant at Colorado City to handle the ores from the Portland mine, which now ships 150 to 200 tons per day.

The growing importance of Colorado City as a milling point is the outgrowth of the construction of the Colorado Springs & Cripple Creek Railroad, in which enterprise many of the more extensive mine owners are interested as shareholders. This road is almost completed and will be in operation by the close of the year. It has very extensive trackage throughout the district, where it will be electrically operated; but it will be operated as a steam road from Cameron, at the foot of Bull, to Colorado Springs and Colorado City.

On milling rates for district ores there appears to have been considerable reduction, though it has been a matter of private arrangement rather than a general announcement. The railroad rates favor the mills rather than the smelters.

Ores running $15 to $30 per ton pay a $3 rate to the smelters; ores running same grade pay $1.50 to $1.75 per ton shipped to the mills in the valley.

The Economic Extraction Co., which handles the ores from those mines controlled by the Woods Investment Co., is milling from 100 to 150 tons per day at present.

Within a month the Strong mill will be shipping again, having been closed down several weeks putting in a plant of machinery.

Within the past few months a large area of land has been patented under mineral location, on the outskirts of the district, manifestly for the purpose of organizing companies and issuing stock to be sold in the East. The greater proportion of such ground is not known to possess any mineral value, as it lies outside the recognized limits of the known mineralized district.

Fifty tons per week are being shipped from the National, under lease to M. Finnerty. Thus far the ore averages about $47 per ton. At the 200-foot level the ore is 3 feet wide.

C. G. Jackson and others, lessees on the main workings of the Gold Sovereign, on Bull hill, have opened the ore shoot at 400 feet depth, which is 100 feet below the tunnel level. It is claimed the ore at 400 feet is as rich as that found at higher levels.

Victor, Aug. 18.

The control of the Matoa G. M. Co. has been sold to W. S. Stratton. The deal is for 501,000 shares of the capital stock; price, 50 cents per share. Mr. Stratton will follow out the policy formerly adopted by the management of this company and put the mine in good condition.

In Stratton's Independence, Baker and Drury, members of the board of directors, state that after fourteen months of development they are able to say that there is 250,000 tons of ore in sight, of a value of $14,400,000, exclusive of the 30,000 tons that have already been extracted, out of which there has been paid $2,000,000 in dividends since the English company took charge. They state that they deliberated a long time concerning the introduction of a chlorination works, but that such advantageous rates were made with one of the local mills for the treatment of the mill ores that they abandoned the project.

The Good Will tunnel is in nearly 3000 feet. The work of making a connection with the Anchoria-Leland is in progress.

At Cripple Creek, on the 16th, the explosion of 150 tons of giant powder wrecked the steam hoist plant and shaft house of the Eclipse No. 2 on the crest of Raven Hill. The blacksmith was sharpening tools in the shaft house, hot coals ignited the exposed powder, and it commenced to burn. The blacksmith then ran out and gave the alarm. The explosion took place immediately. Two men were badly hurt.

IDAHO.

LEMHI COUNTY.

The Montana & Idaho Copper Co. at Gibbonsville has decided to quit. "The properties assayed richly in chlorides of expectation, but development work showed nothing but sulphurets of disappointment. The ore found in the mines looked like copper, but proved to be iron."

WASHINGTON COUNTY.

Carruthers Bros. & Co., Cambridge, report ten carloads of ore being moved from the Old Peacock mine to their warehouse, to be shipped to Salt Lake for Manager Hancock. The men at the mine are sacking 100 sacks of ore per day.

R. H. Terhune of Salt Lake is in Weiser. The Signal says his mission is to investigate the possibilities of Weiser for a copper smelter.

ILLINOIS.

CHRISTIAN COUNTY.

(Special Correspondence).—You may be interested in the oil and gas excitement here. Shelbyville will be supplied with gas by the Great Eastern Oil Co., which is a successful competitor of the Standard Oil Co., having its headquarters at Bradford, Penn. They have option on about 5000 acres of land. This land was worth $5 an acre two months ago and is now worth $200 per acre, on the strength of having discovered and opened up one good oil well. It is thought that the coal beds here are indicative of oil and gas yet undeveloped.

Pana, Aug. 19.

MICHIGAN.

HOUGHTON COUNTY.

A mine is being opened on the Osceola amygdaloid lode. Five shafts, all sizes, are being sunk.

MISSOURI.

CAMDEN COUNTY.

(Special Correspondence).—There are good zinc and lead lands in this county. It is isolated from the railroad at present, but railroad will build through the county within the coming year. The Osage river furnishes means of transportation at present. Linn Creek is the town nearest this field.

Linn Creek, Aug. 20.

MONTANA.

DEER LODGE COUNTY.

The Mammoth mine at Coloma, sold under foreclosure sale and bought by A. H. Larabie of Deer Lodge, is to be worked again.

FLATHEAD COUNTY.

The Snowshoe mine at Libby will remain shut down until the fall rains; 200 tons of concentrates on hand at the mine are being shipped to the smelter at Great Falls.

GRANITE COUNTY.

W. H. Godfrey of Butte and D. A. N. Chamberlin have a bond and lease on the Shamrock, near Garnet, for eighteen months, the bond fixed at $60,000. The mine is developed by a shaft 350 feet deep; another 100 feet will be sunk.

JEFFERSON COUNTY.

Reed & Kennedy of Butte have a lease and bond on the Crystal mine at Basin, on the head of Cataract creek.

At the Eva May mine, Cataract district, a silver producer, are twenty-seven men.

LEWIS AND CLARKE COUNTY.

Butte men have bonded and leased the Copper King group, Cedar Plains mining district, which shows narrow ore seams, 10% copper, $8 gold.

E. T. Wright, manager Columbian G. M. Co., York, says he is mining ore from the Charm mine. The Charm vein is comparatively a flat one. The principal values are found in the fine stuff.

MADISON COUNTY.

C. H. Hand, consulting engineer of A. W. McCune's Watseca mine at Rochester, says the vertical shaft on the Watseca is down 200 feet; eighty men are engaged in development work. Work will soon begin on the old Goodale shaft, which is down 290 feet on the vein. This shaft will be developed an additional 100 feet. In July they produced 1000 tons ore. The mill will be remodeled and enlarged, cyanide tanks will be constructed and a Huntington mill placed in position.

At Pony, Ellis Bros., on the Fremont, near the A. & P. mine, have enough ore to warrant them in purchasing a gasoline engine and stamps. A tunnel is being started 1500 feet below the discovery, where there is a mill site and water for power. The ore is brown iron and jasper.

MISSOULA COUNTY.

In the Copper Cliff district, 8 miles from Garnet, a strike is reported in the Copper Cliff mine, owned by S. J. Ritchie of Garnet, Lienemann and Schmidt of Butte and Salt Lake men.

SILVER BOW COUNTY.

T. R. Hinds, appointed in 1898 receiver of the Boston & Montana Co., has filed final report in the district court and asked for his discharge and for an allowance of $400,000, his fees for acting as receiver, and for about $32,000—expenses, attorney's fees, etc. The supreme court has decided that the appointment of Hinds was wrongful, as he had never been in possession of the property. Among the items of expense is one for $14,000, which he agreed to pay an assistant receiver for the Great Falls smelter, and $15,500 attorney's fees.

NEVADA.

HUMBOLDT COUNTY.

C. M. Benedict, treasurer of the company recently formed in New York to operate the old Eagle mine in Spring valley, is in San Francisco. It is reported that the company has $100,000 to invest.

LANDER COUNTY.

The Morning Star mine, at Dean, is producing ore. There are forty men at work.

LINCOLN COUNTY.

Supt. J. A. Larsen, Independence mine, Stateline, says shaft on that property is 200 feet deep; for 60 feet the work has been upon ore showing values in gold and silver.

STOREY COUNTY.

The water in the C. & C. shaft at Virginia City is now 198 feet below the 1950 level, or over 400 feet below the Sutro tunnel. This is the lowest depth reached since the installation of the hydraulic pumping system.

Electrical engineers are arranging the wiring of the Gould & Curry mill and the C. & C. shaft. Everything will be in readiness as soon as the electric power is sent in from Floriston.

NEW MEXICO.

BERNALLILO COUNTY.

At the Iron King mine, at Bland, ore will be treated in the new mill at Woodbury.

COLFAX COUNTY.

Cimarroncite camp is 15 miles from the town of Cimarron. The Con. Verde M. & M. Co., composed of Lansing, Mich., men, R. S. Rose, general manager, is working men on its Thunder and other properties. It has completed a 4-mile wagon road at an expense of $5000. Two carloads ore shipped to Pueblo gave returns of $30 per ton.

LINCOLN COUNTY.

The shaft at the Old Abe mine, White Oaks, is 1200 feet deep and shows good ore. The property has a 20-stamp mill and a cyanide plant. It has the distinction of being the driest mine in the country: no water or even dampness has ever been encountered in it.

The Jicarilla Placer M. Co., which last spring transferred some 5000 acres of placer ground to the American Placer Co., backed by Cleveland, O., capital, has the hydraulic machinery, weighing 180 tons, on the way, and 4 miles of pipe. Numerous wells are being drilled over the property, some of them 1500 feet deep, upon which pumping machinery is to be placed. The placer ground has been tested and yields an average of 15 cents per cubic yard. The gravel deposit is 2 to 80 feet deep.

W. B. Bates, Supt. and manager Electric M. & M. Co.'s mines at Jarilla, says placer gold is being taken out, but that owing to the lack of water only about half of it can be secured.

RIO ARRIBA COUNTY.

The new concentrator plant at Rinconado is treating fifty tons of ore daily, concentrating ten tons into one. The Copper Hill M. Co., operating the plant, is also working four air drills and getting out $20 ore. The concentrates are hauled 11 miles to Embudo and sent to the smelter at Pueblo.

OREGON.

BAKER COUNTY.

The Magnolia mine, 4 miles north of Granite, goes back to its original owners, Coyle, Clonde & Jones. The $10,000 payment due Aug. 1st under the option by W. L. Vinson was not made. The English bonders invested about $50,000 in the property under the management of W. L. Vinson. It is locally reported that the owners will work the mine and build settling tanks for saving the fine gold. The Magnolia has a new 10-stamp mill. The mine is opened up by three tunnels, the lowest 700 feet, the second 600 feet and the upper 250 feet.

GRANT COUNTY.

Portland and Baker City men have an option on the Blank Elephant claim on Indian creek for $25,000. It consists of a lead of chrome iron.

JOSEPHINE COUNTY.

The Old Channel M. Co. have men enlarging and rebuilding their main ditch at Galice.

SOUTH DAKOTA.

LAURENCE COUNTY.

The North American Tin M. & M. Co. of Philadelphia, capital $1,500,000, has bonded ground in Bear Gulch district, 14 miles west of Deadwood, and it is locally asserted an average assay of 3% tin was obtained, some veins 17%.

UTAH.

JUAB COUNTY.

At Eureka surprise is felt at cessation of work at the Victoria, following the levying of a 4-cent assessment.

SANPETE COUNTY.

At Manti Manager J. W. Hoggan has men working at the Black Pine mine.

SALT LAKE COUNTY.

The Fortune M. Co. has finished surveying for a spur from the Fortune mill to connect with the Dalton & Lark tramway. The grade will be 10%. The spur will save the company 75 cents per ton as compared with hauling ore and concentrates to Sandy.

D. McLeod, former Supt. Old Jordan, is acting foreman Red Wing Extension Co.

The Last Chance, at Bingham, has resumed under the charge of Mr. Hodge, the owner of the properties.

TOOELE COUNTY.

The plant and properties of the Geyser-Marion M. Co. at Mercur have closed down. Manager Moon tells the Tribune work will not be resumed until the indebtedness of the company is discharged and means with which to prospect for new ore bodies are provided. In the close-down about fifty men are out of employment.

The Tribune says the output of the Con. Mercur mines has been swelled to over 1000 tons daily by Supt. Edwards.

The Hercules group, owned by the Cygnet M. Co. at Stockton, has ore that shows ninety ounces silver, 64% lead.

WASHINGTON COUNTY.
